Under the present law, the component county societies in all counties with a population of less than 1,000,000 have jurisdiction in recommending physicians for authorization to practice under the Workmen's Compensation Law They have their own standards of qualification, as the Medical Practice Committee has no jurisdiction in these counties

Therefore, your Reference Committee recommends disapproval of this resolution in its present

form, and I so move

The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

Section 71 (See 48)

Report of Reference Committee on Report of Coun-Increase of Workmen's Compensation cıl—Part X Fees

Dr. F W HOLCOMB. Ulster The fourth resolution is the one introduced by Dr A F Gaffney, of Oneida, and concerns an increase of the workmen's compensation fees

"Whereas, the cost of medical practice has markedly increased since the present fee schedule of the Workmen's Compensation Department was revised, and

"WHEREAS, the fees of private practice in the County of Oneida have increased due to the rise

of the cost of medical practice, be it

"Resolved, that the delegates to the State Convention from Oneida County be instructed to present to the House of Delegates of the State Society. a resolution asking for an increase in the workmen's compensation fee schedule "

This has already been accomplished, and the resolution is approved in principle. I so move

The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

DR ABRAHAM KOPLOWITZ I thought you were going to report on Dr Dattelbaum's report at this

Dr Holcomb No, Dr Dattelbaum's report will be brought in under the whole report of the Reference Committee of the Report of the Council, Part X These were just various resolutions that were referred to us and on which we are ready to report at this time

Speaker Andresen Dr Dattelbaum's report will be reported on later?

DR HOLCOMB

Section 72 (See 7)

Report of the Reference Committee on Report of the Planning Committee for Medical Policies

Dr Thomas M D'Angelo, Queens Your Refcrence Committee has carefully reviewed the report of the Planning Committee for Medical Policies and has been amazed at the amount of work that has come before this Committee during the past year Such a Committee is one whose organization should be more or less the same from year to year and your Reference Committee notes that this plan has been tollowed

The report of your Reference Committee will be as brief as possible, and will touch only on those portions of the report which require action from this It is manifestly impossible for your Reference Committee to completely grasp in a few hours what has taken many meetings and many hours of work on the part of the Planning Committee

The Reference Committee is in full accord with the reorganization of committees where there is overlapping and approves the changes suggested and the renaming of committees to conform with similar ones

in the American Medical Association

I move the adoption of this portion of the report The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

Dr D'Angelo The Reference Committee also approves the recommendation to appoint an advisory committee of specialists within their respective sections to assist the Executive Officer, Dr Robert Hannon, to advise or aid him in matters of legislation and other problems affecting each respective specialty

I move the adoption of this portion of the report The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

Your Reference Committee D'Angelo approves the arrangement of honoraria paid by the New York State Department of Health to speakers participating in joint postgraduate medical educational programs sponsored by their Society and the Health Department of the State of New York.

I move the adoption of this portion of the report The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

The Planning Committee has Dr D'Angelo undertaken an extensive study of hospital facilities and requirements for New York State, especially in relation to the method of distributing this hospital The Federal Governcare throughout the state ment has made available certain sums of money for medical care and New York State is ready to meet the necessary requirements to get this money Your Reference Committee has studied very carefully this section of the report and is of the opinion that any steps taken at this time will set a pattern for the future medical care and practice in the State

The State will establish a number of County General Hospitals in various sections of this State These hospitals are to be served by the local doctors of the community through medical boards are to be connected also with teaching centers for the continuous postgraduate instruction of the medical staff and the physicians of the community This is a staff and the physicians of the community praiseworthy object and one which should be helped in every way, but Organized Medicine should watch this very carefully lest the control and management of these hospitals be taken over by teaching institutions Fortunately, one experiment is now going on, one in the Rochester area and one is projected in Schoharie County The results of these experiments will be watched very carefully by the Planning

The Reference Committee endorses, first, the development of county health units, and, second, the requirement that where state-supported county hospitals exist or may be planned in the future they contain a county health department where such facilities are now inadequate

I move the adoption of that portion of the report

DR. HARRY E. REYNOLDS Section Delegate

second the motion

Speaker Andresen It has been regularly moved and seconded that that portion of the report be adopted Is there any discussion?

DR. THOMAS A McGOLDRICK (Past President) Before putting that motion to a vote, may I ask to have a point cleared up? That part of the resolution now offered only includes the part that has just been repeated at this moment, and not the entire part read, is that right?

DR. D ANGELO It includes only this portion of

the report that was read.

DR. McGoldrick Does it include the entire part that you read or just the part you repeated when

you moved the adoption?

Your Reference Committee en-Dr. D Angelo dorses first the development of county health units and, second, the requirement that where statesupported county hospitals exist or may be planned in the future they contain a county health department where such facilities are now inadequate part before that was explanator

DR. McGoldrick That is what I thought but I

DR. MCGOLDBIGA wanted to make sure of it

ANDRESEN The endorsement is of

DR. D ANGELO Dr McGoldrick's point would be pertinent in a motion that I intend to make later on the adoption of the report as a whole, so I don t see why it could not be discussed now and cleared up

DR. McGoldrick In what Dr D Angelo says was the explanation and which was read as part of the report it was stated as I heard it that these hospitals to be erected are to be staffed through the modical board. Do you include that in your resolution?

SPEAKER ANDRESEN That would be included in any event in the motion to adopt the report as a whole. Dr. D ANGELO That is not included in the

resolution. Dr. McGoldrick But that was in the explana-

tion? Dr. D Angelo That was in my previous explanation

DR. McGOLDRICK Very well

The question was called, and the motion was put to a vote and was unanimously carried

Dr. D ANGELO Your Reference Committee finds that the Planning Committee has already begun the study of the United Mine Workers Welfare and Retirement, and Health and Hospital Funds. though this does not affect the physicians in New York, a pattern may be set for similar action by other labor organizations in this state. Some definite plan should be prepared to cope with this

rapidly developing situation
The Tait-Smith Ball Donnell Bill (S-545) and the Fulbright-Taft Bill (8-140), and the Aiken Bill (8-712) were carefully studied by the Planning Committee An analysis of these bills should be read by every member of the Society We shall not take the time to analyze these bills here.

The study of Group Practice necessarily became an important part of the agenda of the Planning Committee, and that committee reaffirms the set of principles for group practice approved by the Co-ordinating Council of the five County Medical So-cioties of New York City as of November 1, 1945

The committee notes the enactment into law of bills to permit physicians to practice in partnership and to pool fees, and to allow under the provisions of IN-O of the Insurance Law the employment of physicians by nonprofit medical indemnity and hospital service corporations to treat persons in-sured by them. The State Society opposed this legislation because we felt that the bills were loosely drawn and opened up avenues for flagrant violations of medical othics and that they would be contrary to the best interests of the public. Your Reference Committee endorses the recommendation of the Planning Committee that this House of Delegates authorize the Council to have drafted suitable legislation to cover the matter of partnerships and group practice within the principles already approved by the State Society, and that in the drafting of this proposed legislation other interested agencies be con sulted and their aid and cooperation solicited

I move the adoption of this portion of the report.

DR. EDWARD C VEPROVSKY Queens I second

the motion

Speaker Andresen It has been regularly moved and seconded that this portion of the report be adopted Is there any discussion?

DR. HARRY ARANOW (Councilor) Just for in formation, just what other agencies are contem plated? I think we ought to know something about that

DR. D ANGELO Dr Kenney can explain that por tion.

DR. J STANLET KENNEY (Councilor) We did not have in mind any particular agency or agencies but we thought in the framing of such a bill it might be necessary to consult with proper types of organiza itions in order that they might give us some aid in gotting such a bill passed We did not have in mind any specific one. That will have to be worked out later I think.

DR. D ANGELO In reading that over I got the same impression as Dr Kenney has explained, that the Committee would like to go out and got any necessary aid that it could. I think that would be the explanation of it and that is all I can say about it

Speaker Andresen Is there any further discussion?

The question was called, and the motion was put to a vote and was unanimously carried

Dr. D Angrio Your Reference Committee feels that the members of the State Society owe a vote of thanks to the members of the Planning Committee for their tireless efforts in behalf of the Society

I move the adoption of the report as a whole. DR. EDWARD C VEPROVSKY Queens I second the motion.

SPEAKER ANDRESEN It has been regularly moved and seconded that we adopt the report as a whole. Is there any discussion?

DR. J STANLEY KENNEY (Councilor) In the writing of the report I failed to include a request that the House of Delegates authorize the continuation of this Committee for another year seems to me that the work under study is continuing work, and will require supervision and co-operation with the state authorities therefore, I believe it is to the best interests of this Society to keep this Committee alive another year I would like this Committee alive another year I would like to amend the motion to add that, that the House extend the life of this Committee for another year

DR. D ANGELO We will accept that as a portion of our report, to continue the life of the Planning Committee for Medical Policies for another year an I I therefore move the endorsement of the report as a whole with that added as well as our commendation

of this Committee.

Dr Veprovsky I will include that in my second
There being no discussion, the motion was
put to a vote, and was unanimously carried

Section 73

Report of Reference Committee on Constitution and Bylaws Proposed Amendment to Charter Is, Section 1, of the Bylaws

DR PETER J DI NATALE, Cenesee Your Reference Committee on Amendments to the Constitution and Bylaws begs to submit the following re-

port

On the proposed amendment to Chapter IX, Section 1, of the Bylaws, introduced by Dr Stephen H Curtis, delegate of the Section on Pathology and Clinical Pathology, in order to avoid possible confusion later, may I read Chapter IX, Section 1, up to the present suggested amendment

"Chapter IX, Expenses, Section 1 Allowances for expenses incurred in the actual performance of official duties by officers, members of the Council, the Board of Trustees, of the Board of Censors, and committees, and delegates to the American Medical Association shall be made in conformity with the following conditions. The President shall be allowed a per diem and expenses when engaged upon official business. All other officers shall be allowed traveling expenses when engaged upon official business. Members of the Council, of the Board of Trustees, and the Board of Censors, shall be allowed traveling expenses. Members of Committees of the Council, and all special committees of the Society, shall be allowed traveling expenses. Presidents of the District Branches sitting in the House of Delegates shall be allowed necessary expenses."

The proposed amendment would add, following the words "Presidents of the District Branches," these words

"and delegates from the scientific sessions," so that the sentence would then read in full

"Presidents of the District Branches and Delegates from the scientific sections sitting in the House of Delegates shall be allowed reasonable expenses"

Your Reference Committee, after considerable discussion, is of the unanimous opinion that this

amendment be disapproved, because

(1) This will be an added expense to the State Society at a time when the State Society is contemplating asking for increased dues to meet current and expected increases in operating expenses

(2) We feel that should the State Society assume this additional item of expense, other group or groups will also desire that their expenses be paid

(3) The delegates from the Scientific Sections were added to our Constitution and Bylaws in order to more closely conform to the House of Delegates of the American Medical Association. We are informed that the American Medical Association has no provision for payment of necessary expenses of the Section Delegates. We do not wish to set up a bad precedent for the American Medical Association.

I move the adoption of this portion of the report DR JAMES R. REULING (Treasurer) I second the motion.

Speaker Andresen It has been regularly moved and seconded that this portion of the report, which disapproves of the proposed amendment introduced last year, be adopted Is there any discussion?

DR STEPHEN H CURTIS (District Delegate) I submitted this proposal a year ago at the request of the delegates from the Scientific Sections There being no funds available, they felt that a reasonable expense should be allowed them District Presidents are allowed an expense account as well as other committee members, however, the amount of money involved is small compared with some of the other expenses, so I can see no reason why the adoption of that change should not be made

Speaker Andresen Is there any other discussion?

DR REULING These small additions very frequently grow up to be big items. Dr Curtis says that the Presidents of the District Branches are allowed reasonable expenses. Well, the Presidents of the District Branches are really junior officers of the State Society, and it is for that reason that their expenses are paid. They are in no way comparable in my opinion to the delegates from any County or the delegates from any Section. I believe that this would be an opening wedge, if adopted, therefore, this House of Delegates should approve the Committee's report to disapprove the proposed amendment.

PRESIDENT BAUER Just a point of parliamentary procedure, I am not arguing on the motion Ordinarily we consider the Committee's report and adopt or reject that, but this is an amendment to the Constitution and Bylaws, and we should consider that and not the Committee's report I think the motion should be on the adoption of the amendment and not on the adoption of the Committee's report, merely to make it in parliamentary form

SPEAKER ANDRESEN Thank you The Reference Committee then recommends that the amendment not be adopted The vote will be on the amendment, and it requires a two-thirds vote to pass an

amendment

Dr. Di Natale To supplement Dr Reuling's statement, the Presidents of the District Branches are really your Board of Censors, with the President of the State Society and the Secretary of the State Society, so they really are officers of the State Society.

DR CURTIS May I propose that this be put over

for another year?

SPEAKER ANDRESEN Laid on the table?

DR CURTIS Yes

DR JAMES F ROONEY (Trustee) I rise to second Dr Curtis' motion

Dr. Alfred M Hellman, New York Can that be done now?

DR DI NATALE I don't think so

Speaker Andresen There is a question about it in my mind

DR ROONE: And I would state that without question that matter can be laid upon the table. The Constitution and Bylaws provide simply that a proposed amendment cannot be voted upon without due notice having been given at one annual meeting, and the amendment shall be taken up for consideration at a succeeding meeting from that at which it is proposed. Actually, in effect, what Dr Curtis is proposing is that this be laid on the table for this meeting, and giving notice to the House of Delegates that he intends to introduce it at this meeting again to be acted upon at a succeeding meeting.

Dr. Di Natale I believe that is incorrect. This was introduced last year at the House of Delegates

by Dr Curtis

DR. ROONEY That is right

DR. Dr NATALE It was published in the annual

reports about a month or so ago

DR. ROONEY Yes but if I could read the section relative to amending the Bylaws you would see there m no provision in it that it cannot be laid over for still another year The only provision is that it cannot be acted on without due notice, and such due notice is to be given at the preceding annual meeting.

SPEAKER ANDRESEN But there is no provision for its being laid on the table either as far as I can

Dr. Rooney You are quite correct. There is no provision against it.

SPEAKER ANDRESEN I will put the motion to lay this on the table

The motion to table was put to a vote and

was lost. SPEAKER ANDRESEN Now we come to the amend ment itself. We are voting now on the amendment to the Bylaws which the Reference Committee recommended be not adopted This requires a two-thirds vote to carry the amendment

Dr. Erra A. Wolff Queens Willavote of 'Ave

now approve or disapprove the amendment?

SPEAKER ANDRESEN A vote of "Aye approves the amendment, which has been disapproved by the Reference Committee. Is that clear?

We are not ready CHORUS

Dr. Di NATALE I think you misstated it. You

said it disapproves the amendment.

SPEAKER INDRESEN An affirmative vote approves the amondment, which the Reference Committee recommended be disapproved. We are voting now on the amendment itself MEMBER An affirmative vote would support the

recommendation of the Committee?

SPEAKER ANDRESEN No an affirmative vote will pass the amendment.

CHORUS No.

DR. JAMES R. REULING That is right. We are voting on the amendment itself not on the recommendation of the Reference Committee.

SPEAKER ANDRESSN Correct. An affirmative vote will pass the amendment. All in favor of passing this amendment say Aye now those op-posed, 'Nay I think it is safe to say it is more

than a two-thirds vote disapproving the amend-ment. The amendment is lost.

DR. ALFRED M HELLMAN, New York. I afraid we may have a little trouble at a later date think voting on this report has nothing to do with voting on the amendment That will have to come up under that special business of voting on amend ments.

PRESIDENT BAUER That is just what we did. The vote just now was on the amendment,

SPEAKER ANDRESEN That is right.

Those who voted "Aye PRESIDENT BAUER voted in favor of the proposed amendment.

DR. HELLMAN But it was out of order not to

vote on the Committee report now It was not in order to vote on the amendment.

PRESIDENT BAUER Why not?

SFEAKER ANDRESEN This amendment was introduced last year and legally should come up today for adoption or relection and it has been disapproved, so the amendment is lost.

DR. HELLIAM Point of information, isn t there

a provision made on our program where we discuss proposed amendments to the Constitution and By

laws specifically?

SPEAKER ANDRESEN NO Dr. Di NATALE May I proceed? Сновив: Yes.

Section 74

Report of Reference Committee on Constitution and Bylaws Proposed Amendments to Article II of Constitution and Chapter I of the Bylaws

DR. PETER J DI NATALE, Genesee On the proposed amendment introduced by Dr. Samuel B. Burk, New York, Amend Article II of the Constitution by adding after the word Honorary the fol (d) Associate and place the period after the word Associate.

"Amend the Bylaws by adding a section to be known as Section 8 at the end of Chapter I of the

By laws as follows

' bection 8 The Associate Members of this Society shall be graduate physicians who are affiliated fulltime with the Veterans Administration or are serving on permanent appointments in the regular Army or Navy Medical Corps who are stationed temporarily or indefinitely within the State of New York and who shall have been ad mitted to a corresponding form of Associate Membership, without vote in a component Associate Members of county medical society the Medical Society of the State of New York shall pay the regular assessments of the State Society in the same manner as active members. The specific requirements for admission as an Associate Member shall be established by each of the component medical societies.

Your Reference Committee feels that members of the uniformed services, of the Veterans Administra-tion, and of the United States Public Health Service or any other federal services relating to health activities are always welcome to the scientific sessions of our state and local medical societies.

We believe that at present each county medical society may amend their own constitution and by laws allowing these societies to have any type of membership they desire, so long as it is submitted to the Council for approval before it becomes effective.

This amendment states that these associate mem bers of the Medical Society of the State of New York shall pay the regular assessment of the State Society in the same manner as active members.

Your Committee feels that if you assess these associate members like active members you should give these associate members the same privileges that active members have, namely

(1) Receive the JOURNAL
(2) Act as delegates
(3) Malpractice insurance

Malpractice insurance and defense Receive the Directory

Vote and hold either elected or appointed

offices

(6) Aid from the workmen's compensation bureau, etc.

Your Reference Committee, after full discussion, is of the unanimous opinion that such an amend ment to the State Society's Constitution and Bylaws is not needed nor necessary therefore, we recom-mend disapproval of this amendment. I move that mend disapproval of this amendment the amendment be not approved

SECRETARY ANDERTON I second the motion.

SPEAKER ANDRESEN We are in the same situa We have an amendment tion as we were in before. before the House and our Reference Committee has recommended that it be not adopted The amend ment is to create Associate Membership with cor

tain privileges. Is there any discussion?

Dr. Samuzi B Burk, New York. When this amendment to the Constitution and Bylaws was originally brought to the House it was at the request of the New York County Medical Society to me have had occasion to serve in both wars and was stationed in different places where the medical men connected with the armed forces were given little, if any, notice of events that went on in the different We were not told about the varimedical societies At that time it would have been very ous activities helpful for those who were in the armed forces to participate in what Organized Medicine had to offer, whether it was to go to meetings, to meet the local men and exchange ideas, or to participate in scientific procedures

I have had occasion to discuss this proposed amendment with the Chairman who has made his recommendations to you, and in view of what he tells me that this provision can be cared for by each county medical society I believe that the action taken should be to negate this amendment of mine

(Applause)

SPEAKER ANDRESEN All those in favor of adopting the amendment which is against the recommendation of our Reference Committee will say "Aye", contrary "No" The amendment is lost

(See 42) Section 75

Report of Reference Committee on Constitution and Bylaws Proposed Amendment to Chapter I of Bylaws

DR. PETER J DI NATALE, Genesie On the resolution that was referred to our Committee on Amendments to Constitution and Bylaws as presented by Dr Homer J Knickerbocker, of Ontario County, its substance is about the same as the previous amendment, however, I will read the change that he proposed so you may follow our recommendation

"Whereas, the present Bylaws of the Medical Society of the State of New York make no mention of Associate Membership, therefore be it

"Resolved, that Chapter I of the Bylaws entitled 'Membership' shall have added thereto a new section to be known as Section 8, to read as follows

"'Section 8 Constituent County Medical Societies may elect Associate Members from among the personnel of U S Government facilities located within their jurisdiction by following the same routine as prescribed for the election to Active Membership, except that New York State Registration may not be deemed essential

"'Associate Members shall be exempt from payment of State Medical Society assessments They shall be accorded all the privileges of Active Membership except voting, holding elective office, or being eligible to malpractice defense by counsel of the Medical Society of the State of New York."

Your Reference Committee feels that this amendment is not needed, nor necessary in order to fill out our State Society's Constitution and Bylaws recommend that this be not adopted

I am told by our Secre-SPEAKER ANDRESEN tary that this was only introduced at this meeting of

the House

a. ~.3

Dr. Knickerbocker Yes, but it was offered as a substitute or an amendment to the previous recommended amendment.

After having listened to Dr Burk, and the explanation given by the Chairman of the Reference Com-

mittee, I would like to withdraw this

SPEAKER ANDRESEN I was wondering what the procedure would be now that the amendment was

I don't know how we can act on this at this session of the House However, the amendment has been withdrawn, and we also declare it could not be acted upon thus year

Dr. DI NATALE Dr Knickerbocker has with-

drannit

Speaker Andresen Very well, proceed.

(Sec 41) Section 76

Report of Reference Committee on Constitution and Bylaws Amendment to Article II of Constitution

DR PETER J DI NATALE, Genesce Would Dr Knickerbocker also like to withdraw his proposed amendment to Article II of the Constitution, which covers the same subject of Associate Membership, and which was introduced under similar circumstances?

DR. HOMER J KNICKERBOCKER, Onlario would

DR DR DI NATALE Thank you! That makes it easy, and I will not have to give the report on that, which was also of disapproval

SPEAKER ANDRESEN It has been withdrawn

Thank you, Dr Di Natale!

It has been suggested, as the delegates are becoming a little restless, that perhaps they would like a tte recess (Applause)
There was a five-minute recess at this five-minute recess

point

SPEAKER ANDRESEN Will you please come to order, gentlemen?

We will have the introduction of resolutions, before we get back to the Reference Committee reports Are there any resolutions?

Section 77 (See 25, 115) Specialty Boards

DR FRANK LAGATTUTA, Bronx I would like to have the permission of the House to withdraw my original resolution on specialty boards, and if that is given I will substitute an alternate resolution

SPEAKER ANDRESEN We will first have to have the permission of the House to withdraw your original

nal resolution

Dr. Ezra A Wolff, Queens I move that such

permission be granted

The motion was seconded, and as there was no discussion, it was put to a vote, and was unani mously carried

Speaker Andresen The original resolution as presented by you has been withdrawn, by consent of

the House

Dr. LaGattuta Non I would like to introduce an alternate resolution

"WHEREAS, it is the policy and aim of the American Medical Association to foster affiliations of all physicians with a hospital in order that they might continue their education and increase their efficiency, and

"WHEREAS, interference in doctor-hospital relationship is influenced by the indirect action of the

various specialty boards, and

"WHEREAS, on account of the numerous complaints from returning veterans being unable to qualify for the boards on account of a lack of available and acceptable residencies, and

"WHEREAS, this condition is prevalent through-

out the country, therefore be it "Resolved, that the delegates of the Medical Society of the State of New York be directed to

memorialize the House of Delegates of the American Medical Association at its forthcoming June meeting in Atlantic City that the Board of Trustees be requested to appoint a committee for the purpose of investigating the Hospital Specialty Board relationship and to take whatever means are necessary to correct the situation

SPEAKER ANDRESEN Referred to the Reference Committee on New Business A, of which Dr Leo F Simpson is Chairman

Section 78 (See 72,120)

Group Practice and Partnership

DR. AARON KOTTLER, Kings Mr Speaker the Comitia Minora of the Lings County Medical Society passed this resolution

WHEREAS, the New York State Legislature enacted Senate Introductory 740 Printing 2142 in the 1947 Legislature, which is now a chapter of the laws of 1947 of the State of New York, and

WHEREAS, said law amends the Education Law in relation to the practice of medicine by physicians as partners and permits the pooling of fees and monies for medical services by the members of the partnership or group and employees of such

partnerships or groups and
WHENEAS said bill does not \*pecify or limit the number of partnerships or groups to which an in

dividual physician may belong and

WHEREAS, under the present bill, a physician might be a member of more than one group and use this as a subterfuge for fee-splitting and also create a situation where said member of more than one partnership might be tempted to render services for less than the agreed fee among the group and Whereas, said bill permits a division of the

fees with an employee who does not necessarily have to be a physician under the terms of the bill

therefore be it

Resolved, that we request that legislation be introduced in the 1948 session of the New York State Legislature amending the recently enacted law concerning group practice or partnership and incorporating therein provisions or amendments to correct the foregoing objections

SPEAKER ANDRESEN Referred to Reference Committee on New Business C of which Dr Theo-

dore J Curphey is Chairman
DR THOMAS J D ANGELO Queens

That has aiready been taken up by my committee and we made the recommendation on that matter before. We recommended just what Dr Lottler has in that resolution

SPEAKER ANDRESEN Do you want me to refer

the to your Committee instead?

DR. D ANGELO We have already acted on it SPEAKER ANDRESEN We will refer that to the Reference Committee on the Report for the Planning Committee for Medical Policies

Section 79 (See 124)

Workmen's Compensation-Medical Practice Com mittee

DR. AARON KOTTLER, Kings I wish to introduce another resolution as follows

'WHEREAS, in the years 1935 to 1944 under the laws of the State of New York, the power to rate physicians who were to treat Workmen's Com pensation cases in the City of New York and to investigate all charges of misconduct in the treat

ment of Workmen's Compensation cases and to arbitrate all claims where there is a difference of opinion as to the fee to be paid by the insurance company to the physician was assigned to the County Medical Society, and Whereas in 1944 laws were passed taking

these powers away from the County Medical Societies in the four largest counties in Greater

New York and

'Whereas, the County Medical Societies had conscientiously attempted to follow the provision of the Workmen s Compensation Act during the years from 1935 to 1944 and

Wheneas there were practically no com-plaints concerning the rating of physicians or arbitration by either these physicians the insur-ance carriers, or the State Department of Labor therefore beit

'Resolved, that we request that legislation be introduced in the New York State Legislature in the 1948 session to restore to the County Medical Societies of Greater New York the powers which they had under the compensation laws of 1935

Speaker Andreson Referred to the Reference Committee on Report of the Council, Part Workmen a Compensation

Section 80 (See 101)

X-Ray Diagnosis

Dr. Aaron Kottler, Aings I have a thresolution to present regarding X-ray Diagnosis I have a third

"Whereas, a bill to amend Section 1250 of the Education Law of the State of New York in relation to practice x-ray diagnosis and treatment, and treatment by radium was introduced in the 1947 legislature, which bill was not passed therefore be it

Resolved that the Medical Society of the State of New York request that a bill be introduced in the New York State Legislature in 1948 as fol-

A ray diagnosis means that method of medical practice in which demonstration and exammation of the normal and abnormal structures parts or function of the human body are made by use of x rays and any person who holds him-self out to diagnose or able to make or makes any interpretation or explanation by word of mouth writing or otherwise, of the meaning of a fluorescopic or registered shadow or shadows of any part of the human body made by the use of x rays, and also the use of x rays or radium for the treatment of any human allment, shall be deemed to be engaged in the practice of medicine within the meaning of this article and Section 1262 as follows The provision of this article shall be deemed to prohibit the practice of x ray diagnosis, x ray therapy or radium therapy as defined in subdivision 7A of Section therapy 1250 of this chapter by any person other than a person licensed as a physician a dentist, an osteopath or a podiatrist.

Be it further

Resolved, that the Medical Society of the State of New York actively work for the passage of such a bill in the Legislature during the year of 1948.

SPEAKER ANDRESEN Referred to Reference Committee on Report of the Council, Part IX Logislation.

Section 81 (See 132)

Veterans Medical Service Plan of New York, Inc.

Dr. HERBERT H BAUCKUS (Past-President) Mr Speaker and Members of the House of Delegates, this resolution refers to the activities of the Veterans Medical Service Plan of New York, Inc. and if I may have permission for a moment I would like to say that this is the Plan which has made the contract for you with the Veterans Administration You have been taking care of veterans with serviceconnected disabilities under this Plan since Septem-We signed the contract in August, ber 16, 1946 1946, which was a contract for one year, and we are to renegotiate it this year as of August 7, 1947 The Board of Directors of this Plan met yesterday

afternoon, and it is at their request that I introduce

this resolution

I would like to say also that it shall be the effort of the Board of Directors to negotiate the new contract under the same provisions and terms as now exist

At the conclusion of this resolution, Mr Speaker, I would like you to call upon Dr Frederick Lane, who is the chief of the Outpatient Division of the New York State Veterans Administration He is the doctor with whom our Board meets regularly, and I would like to take this opportunity to thank Dr Lane for his cooperation in the past year, and to say that I am delighted he has the viewpoint which we, in general, feel is necessary for the development of good American medicine Dr Lane has with him some charts he may show you He, also, will have an exhibit downstairs in the scientific assembly

"Whereas, the veteran suffering from injury or disease incurred during service in the armed forces deserves not only great sympathy from the community but medical care second to none, and

"Whereas, the State of New York through its Workmen's Compensation Commission provides the highest type of care for its injured workers,

and "WHEREAS, veterans with service-connected disabilities should receive medical care of the same high quality as is now being rendered under Veterans Medical Service Plan of New York, Inc , and

"Whereas, the majority of patients in veteran hospitals are those with nonservice-connected disabilities and the Veterans Administration contemplates the erection of enormously increased facilities, primarily to take care of veterans nonservice-connected disabilities, and

"WHEREAS, it would be false economy to deprive the veterans with service-connected disa-

bilities of the finest medical care, therefore, be it "Resolved, that the Medical Society of the State of New York importune the President of the United States and the Administrator of Veterans Affairs to continue and augment the present 'hometown' medical care program, and be it fur-

"Resolved, that the delegates from the Medical Society of the State of New York are hereby instructed to present a resolution to the House of Delegates of the American Medical Association urging the same consideration for the veterans of the entire United States"

SPEAKER ANDRESEN That will be referred to the Reference Committee on Report of the Council, Part VIII, which is taking up Veterans Affairs, and at Dr Bauckus' request with the permission of the House, if there is no objection, we will call on Dr Lane for the remarks which Dr Bauckus said will be a help to us in introducing this resolution. If there is no objection, I will call on Dr Lane

Section 82 (See 133)

Veterans' Care in Civilian Hospitals

Dr Benjamin M Bernstein, Kings I have another resolution on a similar subject, and we may save time if we hear this first before Dr Lane gets

SPEAKER ANDRESEN How long is it?

DR BERNSTEIN It is very short It will only take a second

SPEAKER ANDRESS N Very well, let us have it DR BFRNSTEIN It is on the same subject, Veterans' Care in Civilian Hospitals, and reads

"Whereas, the present practice permits any physician practicing in the State of New York to care for a veteran for a service-connected con-

dition at home or office, and
"Whereas, the present practice, except in
isolated instances, does not permit the physician caring for this veteran to extend such care to a civilian hospital thus interfering with the continuity of care given to the veteran by his physi-

cian, be it
"Resolved, that the Veterans Administration
be requested to modify this practice in such a way as to permit the continuous care of the veteran by the physician of his choice, either at the veteran's home, at the doctor's office, or in any civilian hospital in which the physician usually cares for his own private patients

SPEAKER ANDRESEN This also is referred to the Reference Committee on Report of the Council, Part VII

Now Dr Lane may we hear from you?

Section 83

Remarks by Dr Frederick Lane, Chief of the Out-Patient Division of the New York State Veterans Administration

DR FREDERICK LANE I would like to present some charts

(Chart) This is what the Medical Care Plan has done between September 16 and March 31, 116,000 veterans were authorized care at a cost of \$3,100,-You can examine these in detail downstairs

in the exhibit

(Chart) Broken down by districts, the New York region, the Greater New York area, weekly authorization, 2,500 is up on top here, veterans authorized weekly, \$120,000 per week. The first decrease here was because the greatest number of veterans had already been sent out for care, and a large number of them were cured in a short period of time. This decrease, which I would rather worry not too much about, was that little difficulty we had with the budget

(Chart) Buffalo region, 2,500 veterans per week,

\$60,000 per week.

(Chart) Albany was our smallest region peak here is 1,300 veterans, average about 600 \$20,000 is the peak, now averaging about \$10,000 per week

(Chart) The Syracuse Office was opened in January, for the Syracuse region, \$20,000, \$15,000 on the average, about 800 veterans authorized care por week

(Chart) This plan of New York State shows the location of the authorizing physicians in the various counties The red stars are the authorizing physicians the blue stars are the coordinators, the men who are employed by the Medical Care Plan to supervise the othical conduct of the physician par ticinants As far as I know, there are only two plans of this kind in the United States New York and New Jersey and from the latest information from those who have observed the various plans they feel that most satisfactory from the point of view of physicians is the New York Plan

(Chart) This is something new in veterans, or in Federal affairs one single page for the authorization for treatment, the certification for treatment the physicians bill and invoice all on one sheet of paper

(Applause)

(Chart) This map shows the various plans in operation throughout the United States. The first the orange color have contracts with intermediaries These are paid a percentage. In Michigan, I think, it is 8 or 10 per cent that is paid to the intermediary There are two that are intermediaries New York and New Jorsey, where there is no surcharge and those two also have coordinators. The green are those where there are agreements with the state medical society no surcharge the physician paid directly Thank you very much! (Applause)

SPEAKER ANDRESEN Are there any further reso-

lutions to be introduced?

Section 84 (See 100)

Head of Federal Health Department to Be a Physician

Dn. Leo F Scmrr Clinton. This resolution is merely to emphasize a certain point in the report of the Planning Committee for Medical Policies and to restate for the record the policy of the Medical Society of the State of New York

WHEREAS, there have been introduced into the Congress of the United States bills having for their objective consolidation of all federal health activities under one head, and there is likelihood that other bills for the same purpose will be introduced, and

WHEREAS, the methods proposed for effecting the consolidation of these activities vary in the various bills, particularly as to the administrative setup whereby in some instances the health activities are only a subordinate part of some other de-

partment boit

Resolved, that the Medical Society of the State of New York believes it to be to the best interests of the people of this country that all Fodoral activities having to do with the public health be consolidated under one head and that such consolidated body be set up as an independent body under the administrative direction of a physician and not be consolidated as part of a department having other functions in addition to the public health.

SPEAKER ANDRESEN Referred to Reference Committee on Report of the Council Part IX, Legisla tion.

Section 85 (See 124)

Medical Practice Committee

DR. DWIGHT V NEEDHAM Onondaga, This resolu tion is introduced on behalf of the Workmen & Compensation Committee of the Onondaga County Medi-While it has already been stated in other words I would like to repeat it

WHEREAR, the county medical societies in the State of New York are bost qualified to determine the qualifications of physician as well as to carry on the other functions devolving upon the medical profession under the Workmen s Compensation Law, including the arbitration of medical bills and

"Witereas, these functions are carried on today efficiently and promptly in those counties having a population of less than one million, by the Work men's Compensation Committees of the County Societies without expense to the State and

Whereas these functions were taken away from the committees of the medical societies in those counties having a population of one million or more and were given in 1944 to a Medical Practice Committee appointed by the Chairman of the Workmen's Compensation Board, and "Whereas this Medical Practice Committee

has not been able to independently carry out these functions successfully and has had to depend upon the cooperation and assistance of the Work men s Componsation Committees of the county

\*\*Resolved, that the Council of the Medical Society of the State of New York, through its Committee on Legislation, be instructed to pro-pare and introduce legislation calling for the abolition of the Medical Practice Committee and the restoration of its functions to the respective county societies."

SPEAKER ANDRESEN Referred to the Reference Committee on Report of the Council Part \ Work-

men a Compensation

Section 86 (See 119)

Practical Nursing

Dr. M R. Bradner Orange I am directed by the Medical Society of Orange County to present this resolution on Practical Nursing

"Whereas the availability of properly trained nurses is obviously inadequate to accomplish hospital and private home requirements and when available such services are costing beyond the financial capacity of the majority of patients

WHEREAS, an estimated two thirds of the population of the county desire and need simple nursing and housekeeping assistance during illness such as is customarily rendered by acceptable practical nurses at charges commensurate with

average family incomes, and
'Whereas acceptable practical nurses can be developed through approved training schedules covering essentials of nursing care either in recognized hospitals or under personal guidance of practicing physicians and such practical nurses can and do become able assistants to physicians within the financial capacity of the average family

WHEREAR, New York State—Chapter 472 of the Laws of 1938-amending the Education Law has prohibited practical nursing except by trained graduates of nine months instruction at special schools and in view of the request of the Board of Rogents that the law be repealed, has al most wholly failed to produce a sufficient number of practical nurses and clearly seems to be against

the public interest and
WHEREAS, all the other states of the union
permit practical nurses to function under the permit frame and the second billy of the practicing physician and twelve of them have abandoned compulsory licensure, therefore, be it Resolved that the Medical Boolety of Orange

County request the Medical Society of New York State to take action leading to the repeal of this

SPEAKER ANDRESEN Referred to the Reference Committee on Report of the Council, Part XII

Are there any further resolutions to be presented?

Section 87 (See 118)

To Provide a More Adequate Supply of Hospital Nurses

DR HENRY E McGARVEY, Westchester resolution is from the Westchester County Medical Society, the subject being "To Provide a More Adequate Supply of Hospital Nurses"

"Whereas, there is a nation-wide nurse shortage of alarming proportions, with recently compiled statistics indicating a national deficit of 40,000 nurses, 16 per cent of the hospitals in the United States with closed beds and 33,000 beds in our hospitals unavailable because of the nurse

shortage, and
"WHEREAS, in the month of April, in New York State, hospitals reported 1,831 closed beds and waiting lists of 8,463 patients, primarily because of

nurse shortages, and "Whereas, the national enrollment of 31,000 students in approved schools of nursing in 1946 was some 13.000 fewer than the schools sought, and approximately 40 per cent fewer than the 1945 enrollment, and

"WHEREAS, this trend and the actual shortage

are of serious concern to the nation's health, and "Whereas, the use of the bedside worker trained to perform many routine tasks in the care of bed patients in hospitals has been proved by wartime experience in both military and civilian hospitals to be an acceptable expedient to supplement the services of available graduate professional nurses to the advantage of the patient's

care, and "Whereas, the New York State Board of Nurse Examiners, while licensing practical nurses with requisite training and qualifications, prohibits the training of practical nurses in any hospital maintaining a school for the training of

graduate professional nurses, and "Whereas, the best facilities for the training of those concerned with the care of the sick are generally to be found in those hospitals with

approved schools of nursing, and "Whereas, short orientation courses for socalled attendants, or nurses-aides, do not appear to offer a satisfactory solution to the problem of better and more adequate bedside care, now, therefore, be it

"Resolved, that the Medical Society of the State of New York go on record as endorsing an extension of the training programs for practical nurses in addition to its continued efforts to increase the available supply of registered professional nurses, and be it further "Resolved, that the standards for these train-

ing programs for practical nurses be maintained at the present acceptable levels prescribed by the State Education Department, and be it further "Resolved, that the Medical Society of the State

of New York, in cooperation with the State Board of Nurse Examiners and the New York State Hospital Association, seek liberalization of the interpretation of existing laws so as to permit the training of practical nurses in all hospitals now conducting training schools for registered, professional nurses, and be it further

"Resolved, that the Medical Society of the State of New York urge the establishment of training programs for practical nurses in approved hospitals not at present conducting a nurse training program of any sort, and be it further

"Resolved, that the American Medical Associa tion be petitioned to take similar action urging similar steps nationally, with the offer of active collaboration with other national bodies concerned

with the training of nurses"

SPEAKER ANDRESEN Referred to the Reference Committee on Report of the Council, Part XII, of which Dr Joseph Gus is the Chairman

Section 88 (See 128)

#### Medical Economics in Medical Schools

DR WILLIAM B RAWLS, New Yorl The subject of this is "Medical Economics in Medical Schools"

"Be it Resolved, that the House of Delegates of the Medical Society of the State of New York instruct its delegates to the American Medical Association to introduce the following resolution

"Whereas, the training of medical students is to a great extent under the direction of full-time teachers who are not, and in many instances were never, engaged in the practice of medicine, and, therefore, are frequently not acquainted with or not in sympathy with the viewpoint of the practitioner of medicine on socio-economic problems.

and
"Whereas, at a previous meeting of the House it was requested by the House that courses in economics be established in medical schools as

soon as feasible, and

"Whereas, such a program was delayed by

the onset of war, therefore, be it "Resolved, that the American Medical Association, through proper channels take active steps to insure the presentation to all medical students in the United States of the viewpoint of the practitioner of medicine on socio-economic problems, and be it further

"Resolved, that the American Medical Association assist in the preparation of the material, the securing of speakers, or in any way that is deemed necessary, to further the institution of such a

program at the earliest possible date'

Speaker Andresen Referred to the Reference Committee on New Business B, of which Dr Frederick W Williams is the Chairman

Section 89 (See 125)

#### Request for Opinion Regarding Compensation Ratings of Physicians

DR PORTER A STEELE, Erre I have been reguested by the Medical Society of the County of Erie to present these two resolutions proposed by the Compensation Committee, one being a request for opinion regarding compensation ratings of physicians as affected by the newly enacted law regarding such ratings

"Whereas, the 1947 State Legislature enacted a law which permits the Chairman of the Workmen's Compensation Board to review and revise the compensation ratings of physicians, and

"WHEREAS, the Chairman may use this power to revise ratings granted before the effective date of

this new law, therefore, be it
"Resolved, that the counsel of the Medical
Society of the State of New York be called upon to

render to the physicians of this State a legal opinion as to whether this new law applies to ratings granted before the law was enacted.

SPEAKER ANDRESEN Referred to the Reference Committee on Report of the Council Part X. Work men a Compensation.

Section 90 (See 99)

Status of Employment of Radiologists by Hospitals on Salary

Dr. Porter A Steels Erie The second concorns the status of employment of radiologists by hospitals on salary

' Whereas, the 1947 State Legislature enacted an amendment to Section 13-c(2) of the Work men a Compensation Law which permits hospitals to employ radiologists on a salary basis and

Whereas, this new law is inconsistent and in conflict with Section 1261-4 of the Education Law and Section 13-d(2g) of the Workmen a Compensation Law which prevent hospitals from employ

ing radiologists on a salary basis and "Wheneas, these statutes will result in a great deal of confusion in the minds of radiologists as to whether they may accept a salary therefore, be

Resolved that the counsel of the Medical Society of the State of New York take legal steps to secure an interpretation of the statutes relating to the permissible financial relationship between hospitals and radiologists.

SPEAKER ANDRESEN Referred to the Reference Committee on Report of the Council Part IX, of which Dr Andrew A Eggston is Chairman.

Are there any other resolutions?

#### Section 81 (Sec 117) Training of Medical Technicians

Dr. ALEX, NEWLANDS, Westchester This resolu-tion is introduced by the County of Westchester and concerns the training of medical technicians

"Whereas, it is self-evident that an essential element of good medical care rests in a large degree upon conscientious and well-trained medical technicians and

Whereas very few colleges or universities in this State offer suitable educational programs for the training of medical technicians, now there-

fore, boilt
Resolved, that the Medical Society of the
State of New York memorialize the colleges and universities of the State, urging them to establish a four year curriculum for the training of medical technologists including a minimum of one year of supervised practical experience in an approved hospital and which will lead to a degree in Medi

cal Technology and be it further
Resolved, that consideration be given to a limited
program consisting of one year in besic courses
and one year of practical hospital training, in which certification may be granted as a Junior

Grade Medical Technologist

SPEAKER ANDRESEN Referred to the Reference Committee on New Business C of which Dr Theodore J Curphey is the Chairman.

#### Section 92 (See 5)

Report of Reference Committee on Reports of Secretary, District Branches, and Censors

Dr. Elton R. Diokson Brooms Concerning the Report of the Secretary your Reference Committee commends the efficient and businesslike manner in which the office of Secretary has been conducted under the leadership of Dr Walter P Anderton. He has given unstintingly of his time and talents in representing our interests within the Society by regular attendance at Council and committee meet-In addition to these regular duties, he has officially visited several national medical groups and worked on two important committees. His staff is a good example of the teamwork necessary for smooth functioning of an office which is so important in carrying on our Society business

In his report it is gratifying to note the election of 1 885 new members during 1946 and the reinstatement of 251 members. Deducting deaths and resignations the net increase for the year is 1 476 members a notable accomplishment. It is deplorable that from this number must be subtracted 188 members dropped for nonpayment of dues. It is difficult to understand why any member should not meet his financial obligation to the organization which is so essential in protecting his interests and so instrumental in keeping him abreast of medical ргостека

It is agreeable to note that the Secretary listed in his report 25 honor societies, all of whose members paid their dues for 1946. It would seem appropriate that each year the Stato Secretary's office should officially make acknowledgment to the local treasurer of an honor society. It is he who bears the

brunt of collecting dues

Your Committee is happy to learn that the long awaited Medical Directory will soon be in our hands. We recognize the many difficulties which have been surmounted in its publication. Its arrival will be welcomed by all members since there have been many changes since the last issue. In view of mounting costs means should be found to supplement it without complling a new edition.

Your Committee on behalf of the Society wishes to extend its appreciation to the Publication Commit The fine work of editing a JOURNAL which is constantly expanding its scope and usefulness the publication of outstanding medical and scientific papers and the various departments which keep our membership informed on pertinent medical affairs deserves our highest commendation.

Our Society is to be congratulated on the election to membership on the Medical Grievance Com-mittee of the New York State Education Department of two outstanding physicians, Dr William W Stroot, of Syracuse, and Dr Clarence P Thomas of Rochester, who will represent our interests well on this most important committee.

Dr Robert Hannon, as Executive Officer in Al bany, has maintained a vigilant attitude over the ever increasing legislative proposals which concern medical practice. He has displayed fine acumen in combating legislation detrimental to our interests and has been instrumental in securing enactment of legislation sponsored by our Society It would be amiss not to mention the fine work of the Legislative It would be Committee, under the chairmanship of Dr Harry Aranow, which works hand in hand with the Executive Officer and the component medical societies.

Your Committee is proud that in capable hands the office of Secretary is carrying forward the tradi tions of the work so important to proper functioning of the New York State Medical Society

Mr Speaker I ask the approval of this portion of

the report, and I so move. DR. FREDERICK S WETHERELL, Onondaga

second the motion.

SPEAKER ANDRESEN The approval of this por-

tion of the report is before you for discussion
DR JAMES R REULING (Treasurer) In the Refer-

ence Committee report, if I understood correctly. there was a recommendation that some way be found to issue a supplementary edition to the Directory If my memory is correct, the Council has already gone on record as directing that immediate steps be continued for the issuance of a new directory probably a year from now That part of the report, if adopted, would negate an action of the Council

The Council took that action, I believe, because of the enormous amount of work and the question of personnel that needs a lot of training in order to

accomplish the thing with a minimum cost

I would like to hear some more discussion on that, probably from Dr Kosmak or Mr Anderson, who could probably give you more information on it than

SPEAKER ANDRESEN Dr Kosmak, do you want

to discuss this?

DR GEORGE W KOSMAK I am very sorry know that my hearing is somewhat defective, but I think it would be good enough if the microphone worked I don't know what Dr Reuling wants me to discuss

DR REULING I will ask the Chairman of the

Reference Committee to reread it

Dr Dickson "In view of the mounting costs, means should be found to supplement it (the Directory) without compiling a new edition"

That is rather a difficult order Dr Kosmak The Publication Committee has already under way the continuation of a directory publication by making arrangements for the retention of a skeleton staff during the interval between the issues of the Directory It was felt in order to keep this information up-to-date, it would be necessary to publish a new volume every year The publication of new volumes in that way will not necessitate the amount of corrections, etc , that were found necessary at the time such a long interval elapsed between the two dates of publication Necessarily, when there is such a long span, a good many changes have to be en-countered We feel that the present volume may contain what might be regarded as errors, but that is something that cannot be avoided because we had to have a date after which no further corrections would be received, but this matter will be taken care of in subsequent issues I trust that explains it

We realize, of course, the great increase in the costs of this particular volume, but we hope by the continuous publication of the Directory a great many of these costs will not be duplicated It was very difficult during this war period to organize a satisfactory staff because of the difficulties in securing appropriate personnel, but I think that Mr Anderson and his staff have done an excellent piece

of work.

The lateness of the issue must, of course, be attributed to printing difficulties and to the lack of the paper supply and labor for binding the volume We have a dummy copy on exhibition down at the JOURNAL exhibit, and we trust that with good luck the Directory may be issued some time during the coming month

DR DICKSON May I ask you a point of informa-tion? When would you plan to publish a new edition?

Dr. Kosmak The idea is to publish a new edition every year

Dr. Reuling Might I ask the permission of the House for Mr Dwight Anderson to speak?

Speaker Andresen Is there any objection to having Mr Anderson speak? Hearing none, will you proceed?

MR DWIGHT ANDERSON Mr Speaker and Members of the House of Delegates, since 1941, as you men all know, and as you are fully aware of from the many questions that have been asked by you of us, there has been no edition of the *Directory* of the Medical Society of the State of New York until the forthcoming issue which will come from the binders in June During this period the Publication Committee, of which Dr Kosmak is Chairman, has made every effort to study other possible ways of supplementing this Directory in order to fill this gap I see some of the men present who have been particularly interested in this special matter because, logically and naturally, their telephone numbers are wrong. their addresses are wrong, and their listings do not comprehend some of the Societies which they have joined and some of the additional and different workmen's compensation ratings that have been given to We have gone fully into the matter of the cost of publishing supplements from time to time the practical impossibility of getting paper during the war, and the difficulty of securing clerical help, it was considered to be simply impossible however, we meet with a little different situation in which it is possible that in 1948 the paper situation

I may say this to you that the paper situation today is worse than it was during the war for the reason that when the limitations of the Government had been removed printing plants, in order to be supplied with paper, especially those getting out current periodicals, purchased paper factories to insure their supply. It is almost impossible to in-It is almost impossible to increase the amount of paper we are able to get, and we were quite fortunate in getting 50 tons for the Directory, which we finally did succeed in obtaining From the best I can learn, the paper situation will

not clear up until 1948

In a supplement to the Directory there would be practically no income You could not sell it, as we do the Directory—we have already sold 1,400 copies of the Directory—to outside people other than the members at a charge of \$12 50 per copy, and we may sell more. These matters of income and advertising all reduce the cost to the Society at that, with the rising cost of labor, the increasing cost of paper, and the increase in the cost of binding and everything else-it has gone up to twice the former cost or one and one-half depending upon the particular item-it did not seem to us feasible (and it does not seem to me to be feasible) to publish a

supplement

Assume that a supplement were published subsequently, then you have the original directory plus a supplement, plus another supplement, plus another supplement, plus another supplement, until we feel that this deficit, which is twice the deficit of 1941 that the Society bears for the 21,200 copies of a book costing us more than \$2 50 apiece just to print, will even be greater If you get these supplements out regularly, there is this question involved You get out your o-iginal directory, the full volume, then you get a supplement out, qua terly, semi-annual, or annual, and you have several supplements lying on your desk, so you have to look up your man in the main directory, and then you have to look him up in supplement one, and then you have to look him up in supplement two, and then you have to look him up in supplement three, all of this, we will say, before the next Directory comes out, and are you going to be satisfied with all of this detail?

Furthermore is your secretary going to have those two three or four supplements and the original directory handy when you want to find somebody?

After talking with a number of men, and visualizing the men who use the Directory sitting there and endeavoring to look up something in it, we felt it would be better less expensive in toto and a greater convenience to the doctor to wait until a new and complete edition were published

I can add this To take care of the compilation problem we have had to augment our staff con siderably We have had to add at least double the number of girls When we are performing the act of sending these cards to the press which is an ad ditional card to the membership files that work has to be practically continuous, and those salaries have to be paid right along so altogether we decided we would prefer to recommend that there be a more frequent edition of the Directory than that the supplement idea be adopted Thank you!

SPEAKER ANDRESEN Thank you Mr Anderson!

DR. REULING As an amendment to the motion, I move to delete that part of the report which deals with the publication of a supplement to the Direc-

The amendment was seconded and as there was no discussion, it was put to a vote and was carried

SPEAKER ANDRESEN The amendment to delete has been passed so now we have the original motion as amended before us for consideration.

Dr. Dickson I move for the approval of this portion of the report with the deletion.

The motion, as amended, was put to a vote, and was unanimously carried.

DR. DICKSON Regarding the Report of the Dis-trict Branches the District Branches during 1946 all held their regular meetings, presenting varied and extremely instructive programs on current medical subjects. They brought to many individual physi cians whose busy lives preclude visiting our teaching centers a day of exceptional postgraduate instruc-

When one reviews attendance, your Committee feels that greater publicity should be made through the local societies to secure the presence of larger numbers of physicians at these meetings. The use of the panel type of discussion with several outstanding medical speakers as moderators may be one answer to this question. Several viewpoints would be presented, thus interesting men in the various specialties in addition to the general practitioner

Your Committee also notes that the President and Secretary as well as many other members of our official family attended all these meetings. This offered opportunity for your state leaders to meet and discuss sectional medical problems with local society members. The members in turn learned how

The Woman's Auxiliary has been represented at all meetings and has extended its activities by interesting local groups in forming new auxiliaries. Your Committee feels that the Auxiliary groups have made a fine contribution to medical progress under the leadership of unselfish and well-informed women

Your Committee believes that the District Branch meetings make a fine intermediary organise tion between the local societies and the State Modical Society Their activities should be aug mented.

Mr Speaker, I ask for approval of this portion of the report, and I so move.

The motion was seconded, and as there was no discussion, it was put to a vote and was unani-

monely carried

Report of the Board of Censor Dr. Dickson Your Committee is happy to report that it was not nocessary to review a report of the Board of Censors there being none This implies that no cases were brought before the Consors for consideration.

Mr Speaker I ask for approval of this portion of

the report and I so move

The motion was seconded, and as there was no discussion, it was put to a vote and was unani mously carried

Dr. Dickson Now I move for the approval of the report as a whole with the deletion already acted upon.

The motion was seconded and as there was no discussion, it was put to a vote and was unanimously carried

Section 93 (See 9)

Report of Reference Committee on Report of Council-Part I Postgraduate Education

DR. CHARLES F ROURKE Schenectady We note that instruction in a wide variety of subjects was provided by speakers selected by this Committee before county medical societies hospital staffs, and other medical groups

Close cooperation was maintained with the State Department of Health, giving further evidence of the desire of this Society to cooperate with all departments of the State Government in matters pertaining

to Medicine

N e further note that arrangements were made for single lectures or a series of lectures for 34 county medical societies or academies of medicine, totaling 142 lectures in all, and for 34 regional meetings and teaching days. The area covered includes practically every part of the state.

Your Committee recommends that the House of Delegator commend Dr Mitchell and his Com mittee for the marvelous work they have done in the past, and that we assure them of our wholehearted

support for their work in the future

Your Reference Committee recommends that the report of Dr Mitchell and his Committee on Postgraduate Education be accepted and I so move.

The motion was seconded and as there was no discussion, it was put to a vote, and was unanimously carried.

Section 94

Report of the Reference Committee on Report of Council—Part XI Publication, Medical Publicity and Contract with Kings County Medical Society

Dr. EUGENE H COON, Nassau The Reference Committee on Report of Council, Part VI Publica-tions and Publicity submits the following report

Publications Your Reference Committee has considered the report of the Council on Publications and read the reports of the Council Committee as reported in the minutes of the Crunell meetings and published in the JOURNAL. We approve of the attractive appearance of the JOURNAL We are especially pleased with the appearance of the Con vention Lesue

Your Committee wishes to comment favorably on the content of the Journal. The popular features Conferences on Therapy and Clinicopathologic Conferences, have been continued and several new departments have been added. These deal with Medical Care Plans, Veterans Administration, Council Meeting minutes, and others These should serve to interest our members and keep them informed about the Society's diversified activities

The Editorial Board notes with pleasure "that our editorials have elicited critical responses from readers and that an increasing number have been quoted in the newspapers and other periodicals' Your Committee concurs in this pleasure and believes it is enjoyment well earned, the result of the careful supervision of the department, the frequent meetings of the Board, the expanded field of editorial writing and, finally, the excellent choice of editorial material

In this regard your Committee would direct your attention anew to a paragraph in the Report of Reference Committee on Report of Council Part XI Publications for 1946, Dr George C Adie reporting

"Your Committee has discussed a new feature which might be added to the JOURNAL This may be called 'Signed Editorial Articles' This section would give members of the profession and recogmized experts an opportunity to express them-selves on current medical problems The adoption of such a plan would in no way alter or be a substitute for the present editorial material It is suggested that space be made for articles which appear to be above the plane of letters to the Editor or personal communications All material submitted as a signed article would be under direct control of the editorial staff and printed at its discretion "

This Committee also suggests that this feature be given due consideration by the Editorial Board and the Publication Committee

Your. Committee is very aware of the acute shortage of paper for the publication and of the printing difficulties and joins with the Publication

Board in asking authors to bear with them

We note that the Publication Committee is slowly but surely conquering the many obstructions which This is a trebar the way to a new directory mendously difficult undertaking in these times, but we are assured that the Directory will be distributed this year June, 1947 A copy for your inspection is on exhibition in the State Society exhibit in the lobby of the auditorium. Your Committee recommends that a skeleton staff be retained and steps taken to publish the Directory annually

Your Committee joins with the Council Committee in acknowledging the efficient and conscientious work of Miss Willma L Simmons and her assistants in the editorial office, of Mr Dwight Anderson, Business Manager, and his associates, of Dr Laurance D Redway and Dr Armitage Whitman in preparing their informative editorials, and of Miss Doris K Dougherty and the members of her staff This spirit of cooperation is not felt by the Council alone, it permeates outward and manifests itself in all parts of the Society, registration desk, district branch meetings and in county society contacts. The entire Medical Society of the State of New York is indeed fortunate to have such loyal workers

And, finally, your Committee recommends that the House of Delegates continue this special committee working under the supervision of the Council, and that the House give the following directive as to

the continuance of its personnel

"The Publication Committee shall consist of the Secretary, the Treaturer, the Executive Secretary, the Managing and Literary Editors, and one member of the Board of Trustees to be appointed by the President of the Society after

consultation with the Chairman of the Board of

I move the adoption of this portion of the report

The motion was seconded, and as there was no discussion, it was put to a vote, and was unani mously carried

Medical Publicity Your Reference Dr Coon Committee wishes to call your attention especially to the ever widening field of activities of the Publicity

Under their guidance, press releases on many topics have been prepared, such as the addresses of our late President Hale before the several district branches, the organization of Veterans Medical Care Plan, Inc , by the Society and the Veterans Administration, and abstracts of scientific papers

which were a part of the 1946 meeting

During the 1947 session of the Legislature the
Committee prepared and distributed reprints of
"Can Chiropractic Cure?" from Hygeia, April, 1946, and Reader's Digest, June, 1946 In addition they prepared handbills which stated our reasons for opposing the chiropractic bill Two representatives of the Publicity Committee were sent to our key

cities to aid the county societies

Efforts are being put forth to establish speakers' bureaus in the various county societies. This is a commendable project which should be embraced by all societies A most valuable and is a 64-page booklet, "Check and Double Check on Sickness Insurance" Over 11,150 copies have been distributed We recommend that every doctor read it

The News Letter has been published several times This is an important service and during the year

we recommend that it be continued

We also note and approve of the assistance given by the Publicity Bureau to the preparation of several articles published in national magazines Colher's, Harper's, Reader's Digest, Hygeia, Vital Speeches, and others

We have read the supplementary report of the Council Committee on Contract with Kings County

Medical Society

We agree that "the Editor of the JOURNAL should be privileged to state to whom books should be sent for review, that the books remain in the hands of the reviewer, and, furthermore, that the Editor of the Journal should have ready for reference all journals received for a definite period

These requests necessitate a modification of the In order to accomplish this your Refercontract ence Committee recommends that the Board of Trustees of the Medical Society of the State of New York sit with the Comitia Minora of the Kings County Medical Society and take steps to modify the contract with Kings County to terminate the agreement entered into in 1904

As regards the second recommendation of the committee "that the Medical Society of the State of New York subscribe to such journals as the Publication Committee considers necessary for its editorial use," your Reference Committee after consultation with the Editorial Board feels that it is unnecessary

I move the adoption of this portion of the report Dr. Frank LaGattuta, Bronz I second the motion.

SPEAKER ANDRESEN This portion of the report is

before you for adoption Is there any discussion?
DR. JOHN J MASTERSON (Trustee) The Medical Society of the County of Kings entered into a contract with the Medical Society of the State of New York many years ago, and the effect of that contract was that all books received by the Society as a result

of exchange in the JOURNAL should be reviewed by the Kings County Medical Society, and the reviewer would return the book to our Society after the book was reviewed. This contract was entered into thirty or forty-odd years ago. We have fulfilled our part of the contract to the letter. All of the books that have been returned to us go into our library. As you know, we have in Kings County our own building, and in it is housed one of the largest medical libraries in the United States.

I would like to know if this resolution in any way violates that contract. As I understood the resolution as presented, the books could now be sent to any reviewer by the Editor and the reviewer retain the book. I say that is in violation of the contract and

should not be passed

DR. GEORGE W KOSMAK (Eddor) My attitude on this arrangement I want to assure you is entirely an impersonal one but let me remind you that when this contract was made forty three years ago, the status of the New York Fatar Stournal of Middle the status of the New York Fatar Stournal of Middle the status of the New York Fatar Stournal of Middle the status of the New York Fatar from what it is today it seems hardly fair to insist that a provision of a contract made so many years ago under entirely different circumstances should be imposed upon the Editorial Committee at the present time. We have every sympathy with the Kings County organization which desires to develop its medical library, but I fail to see why this should be done at the expense of the State Society.

When that contract was made, let me remind you that was at a time when the Kings County Society published a medical journal (I forget the name of it, but it was published in Brooklyn), and it was agreed that the publication of this journal would ceases that it would not compete with the JOURNAL of the State Medical Society Well, since that time the JOURNAL of the State Medical Society has increased to such a degree that the competition need

no longer be feared.

As for these book reviews, it seems rather un reasonable to restrict an activity of this kind to the members of one of our constituent societies. As it is, we publish a note in the Journal that all books for review are to be sent to the offices of the Kings County Medical Society and that has been going on for years. It is difficult for the Editorial Office to keep track of these books. A great many of them are sent direct to the County Society yet the Editorial Committee is responsible for disseminating to the publishers of each book two copies of the Journal in which the review appears. We endeavored a year or so ago to develop a file of all books received but we find it rather difficult because we do not receive any notification from the Kings County Society of their receipt. That is just one of the little difficulties which may, of course, be overcome, but our main contention is that the reviews of books should not be limited to the members of one county society seems to me that the entire medical profession of the state should be called upon to review books for the JOURNAL.

As to the keeping of these books it is the custom of every medical journal to allow the reviewer to make whatever disposition of the book that he wants to make. If the men are delegated to review certain books and want to return them to the library that would be their own affair but why should not a man living in Rochester, for exemple who is equally qualified in that branch of medicine not be asked to review a book and why should he be asked to restore that book to the Kings County Medical Society Library? He may want to give it to the Monros County Society a Library or a man in Buffalo may

want to give it to the Eric County Society's Li brary It seems an unreasonable and unfair arrangement aside from the various technical difficulties to

which I referred

DR. Thomas A. McGoldrick (Past President)
If the books as they are reviewed under the proposed
plan remain in the possession of the reviewer per
manently they will them be of no service to the
editors or the Publication Committee of the State
JOURNAL. They will be out of their possession and
scattered over the State of New York so that the
argument advanced by Dr Koemak for the retention
of the books where they would be at the immediate

service of the editors is not practical

One must remember that there was a contract, to which he refers entered into with the Medical Society of the Kings County Kings County published its journal. It received books and reviewed them As the Editor has stated, the State Journal was not in a very flourishing condition at that time, and the County Society of Kings agreed that it would review the books, send them to individual members to anybody designated in the State Society Journal, and the material was to be furnished to the Journal and all reviews should be published there if the Editor thought well of the That has been going on for these many years.

There has been an announcement always in the Journal of books received and after they have been reviewed they have been returned to this Library of the Kings County whose facilities and resources at hand in the city to editors not only of our State Journal but to others and retained there. They are not in the possession of these individual reviewers at any time The plan has worked out well all through the years These reviews have been made and have been published in the State Jours

NAL

Now it has been proposed, first, to make them available to the editorial department of the Jour NAL. That was the first proposition, but there was no place to store them and develop a brand new library for the Medical Society of the State of New York. They have not room enough for their own administrative purposes, and such facilities are not available at the present time in the City of New York. They do receive the journals and then dispose of them. But this work has been done by Kings County and the books are retained in their library The agreement was made to do this work by their giving up entirely their journal which was a very valuable part of their work.

Thelieve a committee for the State Society looked into this matter for a year of which Dr Poet was the Chairman and as a result of their investigation recommended that while the range of reviewers should be extended, the book could be sent to any body in the State, it should then be sent back to the Library of the County of Kings where it should be maintained in the development of this library and where it could be at hand for editors who are in New York City if the Journal is to be published from there as it has been in the past, and where it would be of the greatest number. It is simply an issue of whether a book is to be retained by a reviewer permanently or whether it is to be made available in a library which is well conducted and at the service of all the medical people and the community itself. For that reason I believe this

resolution should be defeated

If one wished to emphasize that books would be reviewed by men all over the State or out of the State if there are men of special ability and skill in a

particular subject, very well, but having as the gist of it that the books when reviewed, whether the review is acceptable by the editor or not, should be retained in the possession of the reviewer to the detriment of the Library of Kings County is contrary to logic and should be defeated

DR KOSMAK May I have the privilege of the

floor for a moment?

Speaker Andresen Yes

DR KOSMAK In answer to Dr McGoldrick, when I said these books are the property of the reviewer. he seems to think we have no control over the publication of the reviews These books are dispublication of the reviews tributed on the condition that whoever gets them

That is understood must submit a review

I want to emphasize another point that I made. namely, that it seems to me unfair to the membership of the Medical Society of the State of New York to have the reviews restricted to members of the County Society of Kings The distribution of the books for review at the present time is entirely out of the hands of the Editor or Publication Committee The books are distributed locally I, for one, have no control over the reviewers The books are sent out to the people selected by the Kings County group, and it seems to me that it is unfair to the profession of the rest of the State to adhere to that Mr Chairman, I would manner of dong things very much like to hear an expression of opinion from

some of the men who don't reside in Kings County
Dr. Ezra A Wolff, Queens I think that this
recommendation of the Reference Committee in no nav affects the contractual relationship between Kings County and the State Society While it expresses approval of certain modifications of that contract, the recommendation actually calls for simply a conference between the Comitia Minora of the Kings County Society and the Board of Trustees of the State Society From that point of view this discussion of the details of the contract are not par-ticularly relevant, and I think that this House can safely adopt the recommendation of the Reference Committee and allow the discussion between the Trustees and the Comitia Minora to go on with some view in mind of modification

SPEAKER ANDRESEN Thank you for clarifying that! The passage of this resolution, of course, will not affect the contract that has been in existence for

forty-three years

DR MASTERSON If there-

SPEAKER ANDRESEN We must confine ourselves to the rules of the House, one of which is that there can only be one discussion by one man on a par-

ticular subject

Dr Masterson As a point of order, Dr Kosmak was given the privilege of the floor twice to discuss this I was only going to speak just the once, but since you recognized Dr Kosmak twice, I would like to ask that that part of the report wherein it is stated that the reviewer would keep that book be read because that is in violation of our contract, and this House has no authority to abrogate that contract without Kings County's agreeing to it
SPEAKER ANDRESEN There is no violation of the

contract Do you want to make an amendment?

DR MASTERSON I understood that in some part of that resolution that would be the effect of it if adopted

SPEAKER ANDRESEN Then why not amend it? DR MASTERSON I only wanted it read in order to clarify this situation

DR McGoldrick Read just that part of it

DR COON It reads

"We have read the supplementary report of the

Council Committee on Contract with Kings

County Medical Society

"We agree that 'the Editor of the Journal should be privileged to state to whom books should be sent for review, that the books remain in the hands of the reviewer, and furthermore, that the Editor of the JOURNAL should have ready for reference all Journals received for a definite period

"These requests necessitate a modification of the contract. In order to accomplish this your Reference Committee recommends that the Board of Trustees of the Medical Society of the State of New York sit with the Comitia Minora of the Kings County Medical Society and take steps to modify the contract with Kings County to terminate the agreement entered into in 1904"

DR JAMES F ROONLY (Trustee) I am speaking to this motion, the motion to adopt the report of the Reference Committee Am I in order?
SPEAKER ANDRESEN Yes, sir

Dr. Rooney I am glad to hear it This matter has been up before every House of Delegates for the last twenty-five years I think it is about time it should be settled However, I feel there is perhaps an error on the part of the Committee in knowing the proper group in the Society to which this matter should be referred. It should not be the Board of Trustees, and I am merely speaking to that point, it should be a committee of the Council because the Board of Trustees has no right to make any policy The Board of Trustees can act on contracts only when the Council has referred the matter to them with their approval or diapproval, so I move to amend that report by substituting the words "referred to the Council in conjunction with the Comitia Minora of the Kings County Society for their determination and such reference as may be needed in relation to the continuance or the termination of such a contract " I move that as an amendment

DR. FREDERICK W WILLIAMS, Bronx I second

the amendment

Dr. ROONEY Later I would like to have the privilege of making another motion after I know whether that has been accepted or not

Speaker Andresen Is there any discussion of

the amendment?

May I read from the SECRETARY ANDERTON Bylaws of the Society in keeping with what Dr Rooney has said, from Section 2, of Chapter V, in regard to the Board of Trustees

"The Board of Trustees shall have charge of all property including trust funds and shall supervise the financial affairs of the Society and shall invest the surplus from time to time. The budget prepared by the Council shall be submitted to the Board for its approval and all resolutions or recom-mendations of the House of Delegates or Council pertaining to expenditures of money must be ap proved by the Board of Trustees before the same shall become effective The Board of Trustees shall make and execute all contracts for the Society," etc

Then under Section 2, of Chapter IV, in regard to the Council, it says

"The Council shall meet at the close of the annual meeting of the House of Delegates," etc

And Section 1, of Chapter IV, provides

"The Council shall be the Executive and Administrative body of the Society while the House of Delegates is not in session and shall control all arrangements for the annual meeting etc.

The Bylaws are distinctly what Dr Rooney has

enunciated SPEAKER ANDRESEN If there is no further discussion, we will now vote on the question which

substitutes Council for Trustees and is practically the same in other respects DR. THOMAS M D'ANGELO Queens Point of order it goes much further than that Dr Rooney

said whether the contract should be terminated or

continued DR. ROONEY You are quite correct I think the

stenographer has that. SPEAKER ANDRESEN Yes but essentially it was

the change I mentioned The question on the amendment was called,

and it was put to a vote and was carried Speaker Ambresin We will go back SPEAKER ANDRESHN We will go back then to the original motion as amended Is there any discussion? The question was called and it was put to a

vote and was carried

Dr. Roomer You are speaking now to the Report of the Committee as amended so I think I have the right under those circumstances to speak again

to the amended motion.

It seems to me gentlemen, we ought to dispose of this thing for good We have taken up at least an hour and a half to two hours of every meeting of the House of Delegates or every other meeting of the House, and I can remember when we took up four hours discussing this thing It is a most point I have listened to the arguments pro and con, and I am not going to speak of those I leave those to your discretion. I think we should refer this whole matter to the Council with the power to take the determinative and finishing action, and I so move Dr. Frederick W Williams Bronz I second

the motion.

DR. McGoldrick May I ask what is meant by 'finishing' -finishing in determining the question or the matter of the contract?

Dr. Rooney May I answer that Mr Speaker?

SPEAKER ANDRESEN Yes.

Dr. ROONEY My idea is this Let us settle this matter and let us terminate this contract if that is what the Council feels should be done, or let us write a contract that is definite in terms and for ninety nine years and let us get done with it My motion means it leaves to the Council that privilege or that right and that power It seems to me that in here and late in the morning beesion with our getting pretty close to no quorum we might better send this to a deliberative body that would have an oppor tunity to cover all facets and to consider them. I know that the Council will not according to your will

DR. EZRA A. WOLFF Queens On this motion to refer with power to act I don't think that Dr Rooney is taking into full consideration that this is a bilateral contract this is not unilateral on the part of the State Society alone From my point of view the Kings County Society has a contract which it can, if it will hold the State Society to for as long as the term of the contract goes and I think it is only by the consent of the Kings County Society that any modification can be made. If it is in the hope that the Council can induce them to consent to such modification I think that this amended motion should be passed by the House

SPEAKER ANDRESEN This is a motion to refer and I believe Dr Rooney's motion will take that into consideration. The idea is to finish the dis-

cussion.

Dr. ROONEY May I have the brief privilege for merely one second to reply to that? I understand perfectly well that all contracts are bilateral You cannot enter into a contract with yourself and have It bind you You may make a vow but that is another matter This matter is immediate. The intent of my motion was that a Committee of the Council with the Comitia Minora of Kings County should meet and settle this thing. That means another meeting of minds and between them they will determine whether to continue or terminate the contract, and it must meet the will of both parties I don t think your objection is quite valid therefore.

The question was called on the motion to refer, and it was put to a vote and was carried.

SPEAKER ANDRESEN We are very late now

are supposed to meet again at two o clock I don t know how we can eat in that time so we will make it 2 15

(At 1 15 o clock Par. a recess was taken )

(To be continued in the October 15 issue)

#### CORRESPONDENCE

#### The General-Practitioner

To the Editor

In a special article, "Is General Practice Becoming A Specialty?", published in the April 15 issue of the Journal, Dr H L Nelms declares the general practitioner is a scientific and economic necessity, who "should not be discriminated against in fees, prestige, or hospital privileges, and should be given adequate recognition with the specialist for his competence and ability" He also calls upon the "profession itself to convince the public of the importance

and necessity of the general practitioner," etc
Undoubtedly, this is a laudable defense of the
general practitioner
But, here again, we come in
conflict with theory and practice, with fact and

fancy

Our hospitals recently have passed rules that only men certified in obstetrics can bring in obstetric Here is frank discrimination against the general practitioner, in a field that was always considered the domain of the general practitioner

The general practitioner is, therefore, ofheially disqualified in his practice and prevented from practicing obsetetries unless it is done either in the home or in a private sanitarium

If the profession itself is not convinced of the general practitioner's competence in obstetrics, how futile it is to expect the "profession to convince the

public of the importance and absolute necessity of the general practitioner"

The real motives that inspired obstetricians to impose this restriction on the general practitioner should be investigated. Such behavior might be expected among competitive business groups, not in our "honorable, ethical" profession Indeed, I beheve our profession, too, needs to be psychoanalyzed

May 2, 1947 (Signed) B GARRISON LIPTON, M 1) 161 West 86th Street New York City

#### Response by Dr Nelms

To the Editor

I am glad you sent me Doctor Lipton's letter for it adds to a long list of written and personal com-ments I have received since your publication of my vice-presidential address entitled "Is General Prac-

tice Becoming a Specialty?"

The letter deals specifically with obstetrics and opens a wide field for discussion One cannot logically quarrel with the hospital management that seeks to insure the best type of obstetric care for its patients and by the same token a practitioner who can demonstrate his competence by training and experience in this field should not arbitrarily be denied the privileges to which his competence entitles him simply because he is a general practitioner

(Signed) Homer L Nelms, M D Albany, New York July 19, 1947

Note -In relation to the foregoing, attention may be directed to a statement in the report made to the recent meeting of the House of Delegates of the American Medical Association (See page 7121, Journal of the American Medical Association, June 21, 1947) "There should be an organized staff of 21, 1947) ethical, licensed physicians holding the degree of doctor of medicine from approved medical schools acceptable to the Council on Medical Education and Hospitals The particular specialties in which residents are being trained should be represented on the staff by well-qualified, experienced, and profi-cient physicians, whether or not they may be certified

in a specialty or gold membership in special societies". It may be added that certain "Boards," such as the American Board of Diplomates in Obstetrics and Gynecology, have declared that they impose no re-restrictions on hospital appointments, that such action has been developed by individual institutions

according to

eminent physicians and surgeons

Pediforme Shoes resulted from years of anatomical research and investigation

from countless checkings of every phase of shoe construction, closely analyzed for every therapeutic or preventive principle incorporated

then personally passed upon by thousands of physicians and surgeons, authorities on orthopedic requirements, they actually became the choice of many of the medical profession

MANHATTAN-34 West 36th Street BROOKLYN-288 Livingston St. FLATBUSH-843 Flatbush Ave NEW ROCHELLE-545 North Ave HEMPSTEAD-241 Fulton Ave HACKENSACK-290 Main St. PRESCRIPTIONS FOLLOWED ACCURATELY AND ACKNOWLEDGED

"Fatty Indigestion

Undigested fat in stool

One of the chief causes of distress in liver, gallbladder and bile tract disturbances is impaired

fat digestion, resulting in flatulence, upper abdominal discomfort, steatorrhea, constipation and related symptoms

Of considerable importance also is the interference with absorption and utilization of iron, calcium, and fat-soluble vitamins-D, E, K and Carotene-leading to well-known deficiencies in these essential dietary factors

Degalol—chemically pure deoxycholic acid—provides Nature's emulsifier to facilitate fat digestion and absorption

In the presence of lipase (which is rarely absent), one or two tablets of Degalol t 1 d usually suffice to reduce appreciably the symptoms of impaired fat digestion and to allow for ab sorption of ingested fat-soluble vitamins

SANDOZ CHEMICAL WORKS, INC.

#### chemically isimilar

#### to natural estrogens

ESTINYL (ethinyl estradiol) is chemically similar to natural estrogen. It is more active orally than any other synthetic or natural estrogen known today. ESTINYL is the first estradiol preparation that is efficacious by mouth in really minute amounts. It provides the economy inherent in low dosage. Five-hundredths of a milligram daily is sufficient to relieve the average menopausal patient. ESTINYL, closely allied to the primary follicular hormone does more than miltigate vasomator symptoms. ESTINYL quickly relieves the common narvous manifestations and badily fatigue, and replaces them with a sense of emotional and physical fitness.

### **ESTINYL**

tablets 🚈

Average menopausal symptoms: One 0.05 mg ESTINYL Tablet daily Severe menopausal symptoms: Two or three 0.05 mg ESTINYL Tablets daily Many patients may be maintained in comfort with 0.02 mg ESTINYL Tablet daily after initial control of estrogon deficiency

Packagings ESTINYL TABLETS of 0.05 mg —pink coated tablets and 0.02 mg —buff coated tablets, bottles of 100-250 and 1.000

### THE WE DOWN ON ENERGY

### Phospho-Soda

अध्योक विकास स्थापन

Prominent clinicians are increasingly reporting<sup>1,2,3,4,5</sup> the value of sodium phosphates for controlled catharsis—available in scientific formulation only in Phospho-Soda (Fleet)\* which has enjoyed such wide acceptance by the medical profession for so many years.

In fulfillment of the most modern authoritative requirements this unique saline laxative provides an ease of administration and a gently efficient action that have made it a prescription favorite for many physicians whenever thorough safe elimination is desired.

Phospho-Soda (Fleet)\* is a precise combination of two official phosphates of soda in uniform

stable and palatable form It is advertised exclusively to the medical and dental professions, supplied in bottles of 2½ 6 and 16 fluid ounces, at all pharmacies.

THOSPHO-SODA AND TILEET are registered trademorts of C. B. Flori Co., lar.

OSBORNE, JORDON & RAUSCH Archives of Dermatology & Syphilology, March 1947

CLINICAL USE OF A NEW ANTIHISTAMINIC COMPOUND (PYRIBENZAMINE) IN CERTAIN CUTANEOUS DISORDERS

ACUTE URTICARIA: "Twenty-three of the 24 patients obtained prompt and definite relief of symptoms. Nineteen of the 24 patients were improved 50 per cent within twenty-four hours and free of urticaria in less than ten days." The dosage utilized was 100 to 400 mg per day, taken for two to fourteen

days

CHRONIC URTICARIA: Nine of 15 patients were definitely benefited "One patient had had urticaria for four months and took 200 mg of Pyribenzamine daily for fourteen days, the symptoms completely disappeared within forty-eight hours and have not recurred" Six of the nine patients who were im-

proved suffered recurrence when the drug was continued. They were again relieved when the drug was resumed.

CHRONIC ATOPIC DERMATITIS: Nineteen of patients "received definite relief of pruritus to extent of at least 50 per cent Three of the ninete experienced relief of pruritus within twenty f

hours The remaining 16 patients were decide

improved within a two-week interval " Since pro

cally all the scratching occurs at night, the dose

schedule consisted of 100 mg before retiring

peated once if the patient awakened in addition,

mg were given two or three times during the day

### lot only in hay fever...

but also in the many cutaneous manifestations of allergy Pyribenzamine hydrochloride (N N R) often provides prompt symptomatic relief

### **Dutstanding advantages**

Pyribenzamine can be tolerated in larger doses when needed, with relative infrequency of side effects—an important advantage in antihistaminic therapy

ISSUED Tablets of 50 mg., bottles of 50 and 500 Elixir 20 mg per 4 cc. (teaspoonful) bottles of one pint Literature and reprints are available on request

DI PHARMACEUTICAL PRODUCTS, INC., SUMMIT, N J.

Restores and maintains normal vaginal

Many recent studies point to the relationship between vaginal pH and the nature of the bacterial growth of the vagina Contrary to views held in the past, the normal vaginal pH is between 3 86 and 4 45, which suppresses the growth of pathogens and encourages growth of the Doederlein bacillus, a normal inhabitant of the healthy vagina A higher pH is conducive to proliferation of pathogens, trichomonads thrive at 5 0 to 6 0, monilia at 5 5 to 6 8, staphylococci and streptococci at 5 8 to 7 8, and gonococci at 6 8 to 8 5

Massengill Powder—incorporating boric acid, ammonium alum, berberine sulfate, phenol, menthol, thymol, eucalyptol and aromatics—is an effective means of restoring the vaginal pH By producing values of 3 5 to 4 5, it discourages growth of many pathogenic microorganisms. It also possesses excellent cleansing and deodorizing properties, and is in itself antibacterial

Massengill Powder has been found a valuable adjuvant in the management of many vaginal and cervical infections due to streptococcus, staphylococcus, trichomonas, monilia, and gonococcus invasion. It is also useful in leukorrhea, pruritus vulvae, vaginitis, and as

a routine cleansing douche.

In 3 oz, 6 oz, 1 lb, and 5 lb jars.

## IMPROVED TOLERANCE

... BETTER RESPONSE

# IN IRON-DEFICIENCY ANEMIAS

White's

A definite advance in the treatment of iron-deficiency anemias is offered in the new Molybdenum-Iron Complex, White s Mol Iron

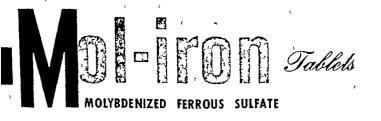

Clinical investigations confirm these advantages of Mol Iron over ferrous sulfate alone substantially reduced incidence of gastro intestinal side-effects coupled with more rapid hemogenesis—even with approximately half the intake of therapeutic iron

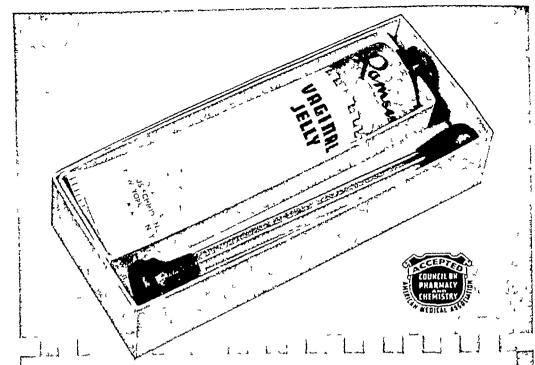

The combined gastro-intestinal tolerance and speed of clinical response to molybdenum-iron therapy are responsible for the rapidly increasing use of Mol Iron in hypochromic anemias of pregnancy chronic blood loss and nutritional origin

White s Mol Iron is a specially processed, co precipitated complex of molybdenum oxide 3 mg. (1/20 gr) and ferrous sulfate 195 mg (3 gr)

In bottles of 100 and 1000 tablets

Try Mol Iron in your most 'iron intolerant' case of hypochromic anemia. Confirm for yourself the more rapid therapeutic action and greater freedom from side-effects

# FACTS ABOUT ROMSES TAULUAK NO. U.S. PAT OF UAGINAL JELLY

- Immobilizes sperm in the fastest time recognized under the Brown and Gamble measurement technique,
- Does not liquely at body temperature nor separate on standing not unduly lubricating,
- Maintains an occlusive film over the cervix uteri for as long as 10 hours after coitus as confirmed by direct color photography,
- Nonirritating and nontoxic, therefore suitable for continuous use

For the optimum protection which can be furnished by a vaginal jelly—"RAMSES"\* Vaginal Jelly can be specified with the confidence that no better product is available Active ingredients Dodecaethyleneglycol Monolaurate 5%, Bonc Acid 1%, Alcohol 5%

#### a ROERIG preparation

J B. ROERIG AND COMPANY • 536 LAKE SHORE DRIVE • CHICAGO 11 ILLINOIS

The liver is the storehouse for the hemopoietic principle, which, according to Castle, is a combination of an extrassic factor derived from food and an intrinsic factor produced by the stomach Liver Extract is believed also to contain certain secondary blood building elements. The therapeutic properties of liver extracts may vary widely—and indeed outstanding authorities have reported that many failures in pernicious anemia therapy are due to the use of mert or deficient extracts.

In the production of ARMOUR LIVER PREPARATIONS, every precaution is taken to preserve the blood regenerating, active constituents of the fresh liver. The finished extracts are tested carefully for therapeutic effectiveness on actual pernicious anemia patients in relapse.

Have confidence in the preparation you prescribe or administer — specify "ARMOUR"

#### **Armour Liver Preparations**

#### Liver Liquid Parenteral

4 U S P Injectable Units per cc (Crude) 1 cc, 5 cc, and 10 cc rubber capped vials A preparation retaining the secondary hem opoietic factors and most of the vitamin content of the liver

10 U S P Injectable Units per cc 1 cc., 5 cc and 10 cc rubber capped vials
15 U S P Injectable Units per cc 1 cc.,

15 U S P Injectable Units per cc 1 cc, 5 cc, and 10 cc rubber capped vials A highly refined and concentrated preparation for massive dosage

#### Solution Liver Extract—Oral \

45 cc equal 1 U S P Oral Unit A readily assimilable and therapeutically effective preparation for use when the oral route is indicated or preferred

#### Liver Extract Concentrate—Capsules

9 capsules equal 1 U S P Oral Unit Odorless, tasteless Sealed gelatin capsules in boxes of 50, 100

### Bile in the Stomach?

This illustration has purposely been made to show the common duct opening into the stomach Had nature intended the bile to be excreted in the stomach, she would have placed the opening there herself Instead, nature releases bile in the small intestine, in which it carries out its function most efficiently

Pulvules 'Bilron' (Iron Bile Salts, Lilly), like nature, release bile acids in the intestine Iron bile salts are made in order to render the natural, conjugated bile acids insoluble in acid media. Hence, 'Bilron' passes through the normal stomach without causing gastric distress. In the intestine, it readily dissolves at the optimum point for emulsification and absorption of fats.

#### Prepayment Plan Progress

With the year 1948 coming up, one may anticipate an intensified campaign to change the methods by which medical service in these United States is produced, distributed, and paid for

Change there must be But it should be based on proved need and proceed in general along lines consonant with the orderly scientific, social, and economic development of the nation

As this is written it seems clear that an already muddled attention with respect to changing the bases of medical service is about to be befogged further by the missmic vapors of a political campaign. It is un fortunate that this cannot be avoided, that the future status of medical service for the United States cannot be approached, discussed, and planned by informed debate and careful examination of the facts, apart from the heat and haze of political turmoil

In the State of New York voluntary medical insurance, one of the sound well-planned methods of providing medical service which has the approval of the medical profession, has increased its membership 43 3 per cent in the first six months of 1947, the total enrollment as of June 30 being 860,703 members. During the same period

in 1946, membership increase was less by 104,356, thus the increase in the first half of 1947 exceeded the same period a year ago by 66 6 per cent

Benefits to members for the first six months of 1947 were \$1,460,770 Benefits to members for the same period in 1946 were \$684,797 The increase in benefits during the first six months of 1947 was \$775,973, or 113 3 per cent

At the present rate of growth, membership as of December 31, 1947, should well exceed our prediction of 1 000 000, and total benefits of over \$3,500,000 to members since the plans began operation

Throughout the nation, according to the Council on Medical Service of the A.M.A.¹ over six million enrollment is noted in medical-society-sponsored prepayment plans as of June 30 of this year. The number of plans continues to increase, enrollment in existing plans grows by leaps and bounds Eighteen plans have a total enrollment of over 100,000, eight others of 50,000 to 100 000, ten more of 25,000 to 50,000 Percentage gains of plans in widely scattered geographic areas of the country during the first half of 1947 range from 4.9 per cent to

1 News Letter 4: 2 (Aug. 30) 1947

763 2 per cent, with an average of 31 per cent

Certainly such percentage increases as are here indicated attest the acceptability of these plans to both the medical profession and the public. The plans stand on their own feet and on the actual ment of the service they provide. It is claimed and will undoubtedly be ballyhooed in the forthcoming political campaign that the principle of voluntary prepayment is a failure, that the plans operating on this principle have not measured up to the demand of the

public, that nothing short of compulsory health insurance can possibly suffice

Neither the principle nor the plans have failed. Not one prepayment plan "developed by medical societies has failed since 1939". That is the fact "In only two states is no plan for prepayment for medical care in process of development". Certainly, the record is not perfect. It does show progress. It shows also the kind of progress, achieved the hard way, which is enduring

<sup>3</sup> Minnesota Med 30 382 (April) 1947

#### How Do You Click?

The recent annual Safety Convention and Exposition held in New York under the auspices of the Greater New York Safety Council for its seventeenth session faced an appalling future. The coming jet and atom age holds prospects that should delight the soul of the writers of grisly tales and make the work of accident prevention a maze of bewildering difficulties.

The experience of man in the evolution of this civilization, from an agrarian era through its subsequent changes based on the application of power to tools of all kinds, has been increasingly unhappy in terms of wastage of human life through accidents. In the application of steam, subsequently electricity, and then gas as a propellant, man has been equipped through his own perceptive mechanisms with the means to become aware of the noxious potentialities of the forces with which he dealt

The exposure to accidental injury and the effect were, if not simultaneous, at least reasonably so As illustration, if a kettle of boiling water accidentally spilled on you, the burn resulted immediately and pain-If you accidentally touched a spark plug while your automobile engine was running, you got instantaneous results of which you became painfully aware These simple cause-and-result relationships were within the comprehension of most people and within their actual but not fatal experience with boiling water, steam, and electricity in daily The point here is that ordinary every-1186

day pedestrian bus-dodgers, barrel-clad taxpayers, or commuters had some conception of what it was all about

The principle of jet propulsion, though not yet in the common experience of the man on the street, is not so radically different from gas-engine-propeller operation or from the Fourth of July rocket as to be incomprehensible. Use of the jet does introduce a new element however, greater height and speed.

What the effect of this will be on accident forecast does not now seem predictable But stratosphere travel, pressurized cabins, supersonic velocities of planes present vistas which give one to think What price dodging falling debris? Ask the British

Release of atomic energy, however, is a horse of a different color Away back in the early days of the x-rays, man learned of a different variety of noxious agent against which his five senses gave him no warning Even his so-called sixth sense was not Long after exposure to the radiation, men began to lose fingers, then whole hands, eventually lives The tragic stories of the girls who, with their lips and tongues, pointed brushes for painting clock hands and dials with radium paint and who subsequently perished from slowly wasting disease will be remembered as examples of what the atomic age holds in store for mankind and those concerned with accident prevention

Injury by radiation presents the problem of providing otherwise unaware people with some means of knowing that they are dangerously exposed to it. Ask any surviving inhabitant of Hiroshima or Nagasaki. The atom bomb has this advantage that everyone who survives the blast has at least been warned. But, even so, the warning is of little use, because once human tissue is expected, certain progressive changes have been started which inevitably continue. No one knows with certainty as yet the duration of

radioactivity of substances once activated Dusts, water, land, and the components thereof become lethal for unknown periods of time

Education looking toward accident prevention in the atomic age will be no simple matter of passing out cards to people on street corners urging caution. It may come to the point where individual Geiger counters must always be carried by everyone and the cheerful "good-morning" give way to "how do you click?"

#### Current Editorial Comment

Venous Catheterization of the Heart Surgery of the heart and blood vessels has now advanced to the point of cure or improvement of certain types of congenital heart defects Venous catheterization of the heart may be helpful in making an accurate preoperative diagnosis Previous reports have been concerned chiefly with the study of cerebral, renal, and hepatic physiology in health and disease, but, more recently, catheterization of the heart has been found to have practical applications, particularly in the study of congenital heart disease Merrill C Sosman' reports on the indications, technics, and errors, and Lewis Dexter<sup>2</sup> on the results, interpretations, and value of this procedure in 100 examinations

The catheter, size 9 French, of woven silk, radiopaque, 100 to 125 cc in length, flexible but stiff enough to be rotated without buckling, is passed into the median basilic vein through a surgically clean incision in either the right or left antecubital space catheter then is threaded into the vein. advanced under fluoroscopic guidance into the axillary vein, the superior vena cava, and the right nuricle From there it may be passed downward into the inferior vena cava, the right or left renal vein, other chambers of the heart, the pulmonary vessels, or into one of the hepatic veins Clotting of blood in the catheter is prevented by a continuous perfusion of normal saline from a reservoir, at a rate of 15 to 60 drops per minute The procedure requires a minimum of three persons trained for proficiency in teamwork Of the 100 exam mations, only 13 were unsatisfactory Subjective symptoms severe enough to cause abandonment of the examination were observed in only two instances

Venous catheterization of the heart has been helpful in making a diagnosis of auricular septal defect, ventricular septal defect, tetralogy of Fallot, and in patent The findings by the ductus arteriosus method of catheterization "should be used in conjunction with the usual procedures of history, physical examination, electrocardiography, fluoroscopy, and, if available, the Robb-Steinberg technic of visualization of the cardiac chambers with diodrast" In more than 1,300 examinations involving the use of a catheter in the heart (100 by the authors and more than 1,200 by others), the authors know of only one fatality It followed the injection of diodrast through the catheter in a patient who had been injected with the same medium ten days previously

The Clinical Use of Anticoagulants Under the above title, Allen' makes an admirable presentation of the dangers of thrombosis and embolism. For centuries physicians have been aware of the dangers of hemorrhage and have devised means for its control and prevention. Only during the past twenty years, however, has there been a progressively increasing realization and understanding that blood within the vascular system may clot too easily and too well Recent knowledge indicates that hemorrhage causes fewer deaths than intravascular thrombosis. The American Red Cross First Aid textbook (1940) appropriately places serious hemorrhage at the head of the list

<sup>&</sup>lt;sup>1</sup> Sosman, Merrill C : Radiology 48: 441–450 (May) 1947 <sup>3</sup> Duxter Lawis: Radiology 48: 451–462 (May) 1947

<sup>1</sup> Allen, Edwar V : J.A.M.A 134: 523 (May 24) 1947

of emergencies requiring immediate treatment. The dangers of acute bleeding often are quickly apparent and rapidly serious. On the other hand, the greater total dangers of thrombosis are at times insidious, lurking, slowly apparent, and some of its serious consequences may be long delayed.

To overcome the excessive tendency of blood to clot within the vessels, there are now available two anticoagulants heparin and dicumarol Both have the disadvantage that, when used to excess or without due care and supervision, they may cause hemorrhage Although neither drug is an ideal preparation, both heparin and dicumarol have been, and are being, used with great benefit

The relative advantages of heparin are quick effect, quick disappearance, necessity to have laboratory control disadvantages are expense and need of parenteral administration The advantages of dicumarol are its inexpensiveness and effectiveness orally Its disadvantages are delayed effect, continued effect for days after discontinuing, and need for laboratory daily determination of pro-The author makes a plea to thrombin time discontinue reporting prothrombin time Instead of reporting the time in seconds, he recommends that all laboratories uniformly report the prothrombin in percentage of As a minimum, he suggests that "every publication should contain the prothrombin time for three critical values of prothrombin, 30 per cent, 20 per cent, and 10 per cent" Deficiencies of prothrombin, with hemorrhage from the use of dicumarol, may be corrected by giving one grain of vitamin K intravenously, or a transfusion of 500 cc of fresh blood

The indications for anticoagulant therapy are (1) after nonfatal pulmonary embolism. (2) for thrombophlebitis and phlebothrombosis, (3) sudden arterial occlusion (embolism and thrombosis), (4) in traumatic cases to avoid thrombosis, (5) postoperative cases with a history of previous thrombosis and embolism, and (6) after abdominal hysterectomy Anticoagulants possibly may be beneficial in acute myocardial infarction, congestive heart failure, and in arrhythmias, particularly auricular fibrillation coagulants should be used cautiously or not at all in (1) deficiencies of ascorbic acid and vitamin K, and in diseases of the liver, (2) renal insufficiencies, (3) blood dyscrasias, (4) recent surgical operations on the brain or spinal cord, and (5) ulcers or open wounds

Among 1,686 postoperative cases, minor hemorrhage occurred in 31 per cent, and major hemorrhage in 19 per cent. There were two deaths from hemorrhage, one not caused by dicumarol, in the other the cause remained in doubt. The results in 280 cases of postoperative thrombophlebitis were as follows.

C	Expected If Antı- coagulants Were Not		
	Used	Occurred	
Subsequent venous thrombosis or pul- monary embolism	68	8	
Fatal pulmonary em-

bolism

In considering the relative merits of anticoagulants and ligation of veins, the author believes the former give the best results, with one exception After repeated thrombosis and pulmonary embolism over periods of weeks or months, ligation may be preferred because of the difficulties of using anticoagulants over a long period the 1,686 cases reported, it appears that 73 lives were saved, and 211 patients escaped venous thrombosis and pulmonary embolism by the use of dicumarol Since thrombosis causes more deaths than hemorrhage, more attention must be given to the need and the means of impairing the ability of blood to clot within blood vessels

#### INTRAVENOUS PROCAINE A PRELIMINARY REPORT

DAVID J GRAUBARD, M.D. RAPHAEL W. ROBERTAZZI, M.D., and MILTON C. PETERSON, M.D. New York City

(From the Traumatic Surgery and Anesthesia Services of the Reconstruction Hospital Unit New York Poel Graduate Medical School and Hospital)

PROCAINE hydrochloride has been used for a number of years as a local anesthetic agent Though the present interest in the intravenous use of this drug may seem new and contrary to the generally accepted procedures, Bier1-2 in 1908 read a paper entitled "On a New Method of Producing Anesthesia in the Extremities" His method consisted of injecting processes into a superficial vein in a given area of a limb which had previously been depleted of blood by the use of bandage and tourniquet The method was not widely accepted in England4 and the United States. At about this time vasopressor drugs were added to solutions of local anesthetic agents to produce local achemia. The addition of the vasopressors to the local anesthetic agents resulted in a sharp rise in the mortality rate with consequent abandonment of the intravenous route. It has been suggested that the cause of death following procesine-epinephrine injection may be due to epinephrine . However, it must be borne in mind that procaine in itself is a toxic drug, whose toxicity is increased three-fold by the addition of epinephrine?

More recently intravenous processine has been used for the pruntus of jaundice, so for the management of burns," as a substitute for morphine in postoperative care, 11 for arthritis, 12,12 for anesthesia,14 15 and for serum sickness.15 17 This report deals with the use of intravenous processe hydrochloride\* for the control of pain in traumatic and inflammatory conditions Although "pain is only a subjective phenomenon quite imperceptible,"is it is an evil to be relieved as promptly as possible by means which will not produce pathologic changes in the human organism. The methods at the command of the phy sician and surgeon are many, but too often the relief obtained is incomplete and temporary, and the side-effects displeasing

Presented at the 141st Annual Meeting of the Medical So-ciety of the State of New York Buffalo Section on Amethesi closer May 7, 1947 Frocalses Aprinchioffed used was "Novocain, generously donated by the Department of Medical Research Winthrop Chemical Company New York City

We have followed the course of the nam syn drome treated by the intravenous infusion of procaine hydrochloride and have found much in Although some of the results obtained. especially in osteoarthritis may point to a specific therapeutic value of intravenous procaine, we feel that the number of our clinical observations is too meager to warrant any definite conclusions. One hundred and forty cases with 608 intra venous procaine infusions are here reported There have been no serious ill effects. The un toward or unpleasant reactions observed will be reported in this paper (Since the first preparation of this paper, the authors have subsequently administered over 2.000 intravenous procaine infusions without serious complications )

#### Physiology and Pathology

Inflammation is the most important of all pathologic processes. Some degree of inflammatory change is present whenever the tissues are subjected to the action of an irritant, be it physical chemical, or bacterial. There are three main phases of the inflammatory process, each with its specific duty (1) vascular changes, (2) formation of inflammatory exudate, and (3) process of repair The first phase is the most important, for on it the second and third depend

The functional control of the blood vessels, possibly including the capillaries, "-11 depends in part on nerve impulses and in part on the ef fects of hormones and other substances carried in the blood. The extreme innervation of peripheral blood vessels is said to be derived from rams from the adjacent nerves at intervals along their course 22 This anatomical finding is especially true in the segmental distribution of sympathetic fibers in the forearm from the elbow down and in the leg from the knee down,

The concept of chemical mediation of nerve impulses is based on the result of numerous experimental studies. The humoral substances liberated are believed to be present at the neuroeffector junction or near them as well as at the synaptic junctions in the autonomic ganglia and within the central nervous system <sup>22-25</sup> Further discussion on the chemical transmission of autonomic effects is beyond the scope of this paper, and one is referred to the work of Rosenblueth and Phillips<sup>26</sup> and others <sup>27-31</sup>

After any injury, reflexes immediately begin to exert their influences upon the affected area Some of the reflexes are a fundamental component of the organism's defense mechanism and contribute to the repair process Others may actually prolong disability In the great majority of cases of mjury the color changes, hyperesthesia, sensitiveness to cold, and other phenomena so frequently observed tend to disappear spontaneously with the completion of the healing But in other instances an irritative process continues 32 Impulses from a focus of peripheral irritation may set up a central disturbance, probably at spinal levels, which may persist even when all possible connections between the irritable focus and the cord have been severed 33

There are three reciprocating factors in the vicious circle of reflex sympathetic dystrophy <sup>34</sup> (1) incoming impulses from the periphery, (2) the internuncial pool activity, <sup>35</sup> (3) the "facilitation" of conductivity within the spinal cord <sup>36</sup> The elimination of the irritable focus producing the incoming impulses would not only break the circle, but in most instances eliminate pain The burning, throbbing pain found in trauma and inflammation is purely sympathetic in character <sup>18</sup>

Why the chemical or surgical section of sympathetic fibers should eliminate the pain originating from the injured sensory nerves is not clear, since sympathetic nerves in the extremities are said not to contain afferent fibers. One hypothesis of the irritable focus postulates the existence of a pathologic state of the sensory nerve fibers. Following trauma, demyelinization of sensory nerve fibers may occur. With cross stimulation occurring between the afferent sympathetic and the poorly insulated sensory axons, resulting in pain or even efferent vasocilatation as in the causalgic state or vasoconstriction in traumatic cases.

The humoral imbalance existing at an irritable focus depends upon the liberation of histamine<sup>25</sup> or histamine-like substances<sup>40</sup> from the immediately-affected cells, directly causing dilatation of the capillaries with which it comes into contact and acting as a persistent stimulus to the sensory endings of the terminal axon branchings. It is this excess of histamine or histamine-like substances, we believe, which acts on the nerve fibers to the terminal arterioles by depressing acetylcholine.

The formation of an inflammatory exudate

depends upon the gradient of permeability of the smaller blood vessels 41-44. The cause of the gradient is to be found in a structural differentiation along the capillary, such that the barrier offered by its wall progressively diminishes on the way to the venule 45. The role of hydrostatic and physicochemical forces in the formation of evudate has been adequately described by Bellis 46. The effectiveness of intravenous procaine therapy in the pathologic state is based on the permeability of the capillary membrane to colloid as well as to ions 47-54.

One can summarize and conclude from the above that the local vasospasm occurring after trauma results in capillary dilatation, incompetence, or decompensation, thereby (1) preventing normal tissue metabolism, (2) interfering with the normal interchange of tissue fluids in the region of injury with the loss of plasma, (3) resulting in the accumulation of the products of trauma, and (4) ending often in the degeneration and local death of tissue

#### Pharmacology

Procaine is para-aminobenzoldiethylaminoethanol, soluble in one part of water in which its reaction is neutral. It is stable and does not decompose at temperatures as high as 100 C. When injected intravenously in sublethal doses, two processes are initiated. (1) hydrolyzation of procaine by an enzyme into para-aminobenzoic acid and diethylaminoethanol, (2) acetylation of para-aminobenzoic acid. 55 56

Nearly 95 per cent of the injected procaine can be found in the urine<sup>55</sup> either as para-aminobenzoic acid, para-aminohippuric acid, para-aminobenzoylglycuronate and diethylaminoethanol, or even as traces of procaine <sup>57</sup> Procaine or one of its hydrolytic products, para-aminobenzoic acid, has been shown to be removed from the blood stream in twenty minutes <sup>57</sup>-<sup>59</sup>

The authors believe that in traumatized or inflamed areas procaine administered by the intravenous route has a twofold action (1) direct action on the irritated nerve fibers, (2) indirect action of diethylaminoethanol on the endothelium of blood vessels Although there is an opinion that procaine intravenously provokes direct action on endothelium, out is our opinion that one of the end products of procune, diethylaminoethanol, is the substance involved The basic structural similarity between diethylaminoethanol, benadryl, and choline must be noted (Fig 1) The mode of action, as with benadryl,61 at the capillary bed may be considered as a competition between histamine and diethylaminoethanol for a given site of action or receptive substance, or the action might be explained from the clinical observations on a

Fig. 1 Structural relationship of diothylaminoetanol benadryl and choline

cholinergic typo response. The investigation of the action of the compound diethylamino-ethanol is a subject of present study.

The toucity of procaine injected intravenously within a short period of time has been found to vary in several numal species 40 to 60 mg per Kg in the rabbit; 40 to 45 mg per Kg in the cat. 40 mg per Kg in the guinea pig; 62 4 ± 14.6 mg per Kg in the dog 4 The lethal dose in man is not known. However, it is well established that the toxicity of procaine in man is dependent upon the percentage concentration administered. Toxicity increases in a geometric ratio

In determining the desage of intravenous procame for the relief of pain, several factors had to be considered (1) the amount, (2) the con centration, (3) the rate of administration Since the death of experimental animals was contingent upon certain critical concentrations of procaine in the blood to produce a central medullary paralysis " we believed the total amount of procaine injected should be well below the average minimum lethal dose of experimental ani mals, 40 mg per Kg The next phase concerned itself with the hydrolytic products of procaine para-ammobenzoic acid and diethylammoethanol Patients could tolerate blood concentrations of para-aminobenzous acid of 30 to 60 mg per hundred cubic centimeters without ill effects The similarity between diethylaminoethanol and benadryl prompted us to accept the desage of benadryl in children," and therefore we chose the amount to be given at any one time to be 4 mg per kg body weight.

The amounts of procaine to be used were so small that in order to obtain accuracy and for increased safety the procaine was diluted to make a 0.1 per cent solution (1 1000 solution) in isotome saline. Thus 1 co. of solution contained

one mg of procaine (A 0.2 per cent solution was tried in a number of administrations but with a greater incidence of unpleasant side-offects)

Anowing that procaine injected intravenously can no longer be identified as such or as para aninobenzoic acid after twenty minutes, and that the sudden injection of large amounts of fluid would not be tolerated we concluded that the total amount of procaine and saline should be given over a twenty minute period. For this purpose we have utilized a flowrator for accurately determining dosage and for a constant uniform rate of administration.

In order to simplify our work, we devised the term "procaine unit", to the amount of procaine calculated at 4 mg per K<sub>b</sub> body weight to be given in twenty minutes in a 0.1 per cent isotonic saline solution. The error factor in using the flowrator is less than one half of 1 per cent. For example, a 70-kilo man would receive 280 mg of procaine in 280 cc. of isotonic saline in twenty minutes, or 14 cc. of isotonic saline in twenty minutes, or 14 cc. of solution per minute. In practice we have most frequently administration. On subsequent administrations the patients were given the predetermined dose

The technic we have employed in preparing the solution is as follows (1) 5 cc of a 20 per cent solution (1 Gm) of procaine hydrocalionde is added to 1000 cc. of isotonic saline (2) the resulting solution is vigorously agitated in order to insure uniform solubility of the drug, (3) the procaine solution is then administered by means of the flowrator incorporated into an ordinary intravenous infusion setup or by the infusion drip with control clamp

With the use of the flowrator administration is simplified. The drip method necessitates the counting of drops per minute and extensive experience in order to administer the drug uniformly. Because of the fairly rapid rate of flow we have employed a number 10 gage needle. A smaller gage may be used for children.

Before discussing the clinical applications, we might mention typical signs and symptoms as observed during the administration. About five to seven minutes after the start of the in fusion the patient usually describes a sensation of warmth throughout the entire body. A flush is sometimes noted over the head face, and neck, except for a marginal circumoral pallor. Soon after the onset of this flush the patient notes a dryness of the mouth, sometimes accompanied by a metallic taste tearing of the eyes dilatation of the pupils, and light-headedness. Many patients feel comfortably relaxed with the alleviation of the pain. In our administration of processing we strive not to exceed those manifesta-

TABLE 1 -- CLASSIFICATION OF CASES

tions The more severe responses to this drug, that we have noted on occasions and which we consider undesirable, are marked dizziness, apprehension, sensation of trembling, or sleepiness beyond comfortable relaxation. We have had two instances of momentary unconsciousness, but at no time has the use of sedatives, oxygen, or restorative drugs been necessary. To date, after 2,000 administrations, we have noted no cases of procaine sensitivity or any contraindication to the use of this drug.

#### Clinical Observations

The 140 cases, upon which this report is based, are classified as (1) traumatic, (2) inflammatory, (3) miscellaneous Table 1 lists the types of cases, the number of cases, the total number of infusions given in each subdivision, and the results

The results in the management of pain in trauma have been uniformly good, except for the cases of herniated intervertebral disk. In the 28 fracture cases, two were reduced without pain under this method, but the anesthesia is not all that might be desired with this technic. On the whole, postreduction pain was controlled satisfactorily with only one infusion in each case.

The low back pain syndrome due to hermated intervertebral disk does not respond to this treatment The following case is illustrative of this

Case Number 37273 —A 48-year-old white man, a clerk, had severe pain in his back with radiation

down the left leg. The presumptive diagnosis following physical examination, roentgenographic examination, and spinal fluid studies was that of herniated intervertebral disk. His weight was 60 Kg, and 240 mg of procaine were given without relief of pain. Operation two days later confirmed the presumptive diagnosis. This case is typical of the pain syndrome due to a mechanical factor. We have since accumulated 15 additional cases to the 5 mentioned above, whose response to procaine has been negligible and whose diagnoses were confirmed at operation. We are using this method for differential diagnostic and

The inflammatory cases\*\* on the whole responded well. A preliminary report on the use of intravenous procaine in the management of arthritis has been presented by the authors recently 12. The results especially in osteoarthritis were very encouraging

The following case is typical of the series

Case number 37438—A 53-year-old white woman, a housewife, complained of pain in her knees and mability to walk stairs for the past two years Her weight was 60 Kg, and she received 240 mg of procaine intravenously—Immediately following the infusion, there was no pain and no restricted mobility—The patient was able to climb and descend steps with ease—She received one subsequent infusion six weeks later—It is now four months since the second infusion, with no complaints of pain or restricted mobility

In the miscellaneous cases we found some interesting phenomena We did not expect to find

<sup>\*\*</sup> Referred from the Medical Service Reconstruction Hospital Unit by Dr Joseph Kovacs assistant attending physician.

any changes in the neurologic cases, but treated them in order to see if any improvement could be noted In 2 cases of anterior poliomyelitis, with flaccid paralysis of many years' duration, there was the following response during the infusion, the patients stated that a tingling sensation of warrath crept down the affected extremities This vasodilatation was maintained following each injection for several days and even weeks The absence of the sensation of cold and the elimination of external heat applications especially at night was very gratifying to the patients This prompted us to try processes infusions in 2 cases of spastic anterior pollomyelitis

The results were relief of spasm increased mobility, and improved muscular control From our observations, the use of intravenous procaine in alloviating muscle spasm suggests its therapeutic application in the symptom relief of the distress of acute anterior poliomyclitis.

The use of curare in conjunction with physical therapy has given some very satisfactory improvement The use of procaine intravenously, in patients who have been on curare therapy every eight hours for one month with only slight improvement and relaxation of the spasticity, responded with what might be termed a dramatic response. Procume infusions were administered to several congenital spastic patients daily for three to four weeks, and then given weekly procame infusions. All of the patients treated with procaine and physical therapy have shown marked relaxation, increased coordination marked mobility of the extremities, and use of the extremities Manipulation and stretching during the procesine infusion is attended with a minimum of discomfort to the patient

An interesting side-effect noted in the spastics is an improvement in speech and increase in mental acuity It should be mentioned that spastic upper extremitics respond slower than the congenital spastics, where the greatest involvement is in the lower extremities youngest congenital spastic treated was twentysix months

#### Summary and Conclusion

- Intravenous procaine infusion for the management of pain in trauma and inflammatory conditions is a safe hospital procedure, provided that the administration is controlled
- The indiscriminate and careless administration of procesne intravenously may prove dangerous
- Intravenous procaine should be considered

as an adjuvant to the management and treatment of selected traumatic, inflammatory, and spastic conditions.

#### Discussion

Dr Maurice Bruger, New York City -The opportunity presented itself to Dr Currence Dr Eby Miss Swanson and myself at the New York Post-Graduate Hospital to follow the variations in blood chemistry in patients receiving a procaine unit (as defined in the above paper) intravenously twice weekly Renal aspects were evaluated by the determination of the whole blood urea nitrogen nonprotein nitrogen and by urine analysis hepatic damage by the cophalin-cholesterol flocoulation test and by thymol turbidity, general metabolic alterations by whole blood sugar (true glucose) and serum cholesterol Sedimentation rates were also determined The chemical studies were carried out at weekly intervals, a total of 17 such studies being made before and during the course of procaine therapy in 5 patients No significant alter ation in any of the chemical constituents of the blood was noted. Urine analysis failed to reveal any renal irritation. It would appear safe to state at this time that proceine administered intravenously twice weekly over a period of one month in the doses indicated has no measureable effect on renal or hepatic function nor does it alter the sugar or cholosterol content of the blood or the rate of sedi mentation of the red cells.

#### BILL PROVIDES HEALTH AID

Introduced in the Senate during the last session, was a bill to provide for the general welfare by enabling the several states to make more adequate provision for the health of mothers and children, for services to crippled children, and for other purposes. The bill was referred to the Committee on Labor and Public Welfare

and Public Welfare

This bill makes permanent the Emergency Maternal and Infant Care Program, authorizing an appropriation of \$20,000,000 for the fiscal year 1949, \$30,000,000 for the fiscal years 1950 and 1951, and such sums thereafter that Congress may determine necessary for the expansion of grants-in-aid to the states for maternal and child health services. Ten per cent of these annual appropriations is made available for dental services for mothers and children, and further authorizations of \$15,000,000 for 1949 and \$20,000,000 for the next two years, for the care and treatment of crippled children

The bill also establishes a Maternal and Child

Health Advisory Council to be composed of not more than 18 members appointed by the Federal Security Administrator without regard to civil service, with at least six appointed from the public, and eight from the medical, dental, and related professions. Two-thirds of the Council is to be selected from panels of names submitted by national professional or other agencies and organizations concerned with medical, dental, nursing, hospital, and other professional services related to maternal and child health and crippled children's services

An additional authorization of \$5,000,000 is included for the purpose of administration, aiding the financing of studies, demonstrations, investigations, and training of personnel for maternal and child health and crippled children's services, and to pay salaries of personnel detailed to state agencies. Authorization is made for the appropriation after the first year of such sums as may be necessary for this function

#### MEDICAL LICENSES REVOKED AND SUSPENDED

The Board of Medical Examiners of the State Education Department has announced the following revocations and suspensions to practice medicine in the State of New York

Samson Chernoff, 223 Second Avenue, New York City License suspended for a period of six months, beginning June 30, 1947

Frank E Kellner, 214 Court Street, West, Rome

License revoked, effective July 21, 1947

Herman T Leslie, 530 Park Avenue, New York City License revoked, effective July 16, 1947

Harry G Lytton, 7812 35th Street, Jackson Heights License revoked, effective July 16, 1947

John R O'Neill, 80 Cranberry Street, Brooklyn Physiotheraphy license suspended for a period of one year, beginning July 8, 1947

#### THE PROLONGED THERAPEUTIC ACTION OF INTRACAINE IN PAINFUL MUSCULOSKELETAL DISORDERS

E H BETTMANN, MD, White Plains New York and New York City

(From the Mount Sinat Hospital, New York City Orthopedic Department in cooperation with Dr. R. Citron from the White Plains Hospital, White Plains New York)

IN THE last few decades a number of com-pounds have been introduced for analysis and therapeutic purposes in the management of painful traumatic and orthopedic musculoskeletal conditions. The value of local and regional anesthesia to alleviate such pain has been recognized and the field of application of analgene injections is steadily expanding sistent, intractable pain accompanying certain fractures and degenerative and inflammatory processes of the joints, penarticular tissues, nerves, bursae, and muscles is frequently so severe that it disables the patient completely Disuse atrophy in long mactive joints and muscles is a common tendency Mobilization of articular and other structures can often be induced by giving a suitable, local anesthetic injection, which then permits other indicated therapeutic procedures. Although frequently only of transient effect, the employment of a suitable anesthetic agent and a correct technic may, in many in stances provide sufficiently long relaxation for the acute pathology to subside and in this way actually bring permanent relief In addition it is believed that only solutions of an anesthetic may have a prolonged anesthetic value at gliding fascial, muscular, and articular surfaces

Comprehensive studies on the therapeutic use of anesthetic agents have been made by Stein brocker, Outland and Hanlon, Wertheim and Rovenstine and Pitkin 11 Steinbrocker presented an extensive review of previous work published here and abroad on local and regional analysis injections and discussed in detail indications, technic routes and efficiency of such treatment. His own results were very promising and invited further studies Employing mostly aqueous solu tions of the anesthotic in ordinary painful conditions, he recommended an oily vehicle for slow absorption where prolonged action is required He also expressed hope for a local anesthetic hav ing the advantages of prolonged analgesia and of low toxicity

Since 1930 the author has studied various substances for their antispasmodic and analgesic effect (todipin, psicaine and eucupine) and in particular their toxicity and prolonged action Although successful in obtaining the latter, attempts to use the agents on a larger scale had to be abandoned on account of late painful tussue reactions. During the last five years he used

intracaine\* (betadiethylaminoethyl p-ethoxy benzoate) a new anesthetic agont, which was found to possess prolonged and superior anesthetic potency with almost complete absence of local toxicity \*-\* The cases presented below are the results of experience with 180 patients treated for a variety of orthopedic conditions and are in tended to illustrate the effectiveness of the intra-caino treatment and the lack of toxic reactions

#### Mechanism of Action

The large part played by vasomotor impulses in the occurrence and intensity of pain and the value of local infiltrations and nerve block in sotting up a regimen of active vasodilatation in a given area has been aptly demonstrated in the classic work of Lenche 10 The rich nerve supply in the supportive tissues of the human body especially in the ligaments in the region of an articu lation, is irritated by trauma or other pathology and a disturbed vasometer functional state characterized clinically by muscle spasm, loss of motion, pain, and tenderness prevails Analgesic injections reduce the local irritability and, by climinating the centripetally traveling pain im pulses from the traumatized area, cause a return of the vasomotor tone to normal brang about a permanent cure in certain conditions and in others control the discomfort until other established measures of thempy achieve their effect

#### Toxicity of Anesthetic Agent

Preliminary experiments were carried out in animals to confirm previously made observations on the low toxicity of the anesthetic agent. These tests were done as follows. 0.2 cc of a 5 per cent intracaine in oil solution was injected by means of a 22 gage needle into the right erector spinao muscle (½, inch deep) and in knee joints of rabbits after hair removal and sterilization. The injection produced immediate anesthesa as tested by needle prick but no other reaction such as swelling or increase in skin temperature over the injected area was noted and the animals lost no weight during the three weeks of experimentation. Injections were made into the muscle on the second, ninth, sixteenth, and twenty first day, and

manipulated during the first visit after intracaine injection the results were much better than in 6 similar cases manipulated without intracaine No untoward reactions in any case were observed.

Fractures—The advantage of a prolonged anesthesia was very striking in such fractures not requiring strict immobilization and where the ensuing, prolonged painlessness allowed early function.

The following types of fractures were treated 4 rib, 2 transverse processes, 5 os coccyx, 1 ulnar styloid, 3 hip, 4 ankle (fibula), 3 wrist (radius), 3 metacarpals, 3 metatarsals, and 2 collarbone All cases were characterized by severe localized pain and general absence of gross displacement, or marked swelling

Treatment—Only one injection of intracaine was necessary in 23 cases and a second injection after a few days in 2 coccyx fractures Eight

patients were treated after the methal, strapping (rib, transverse proces, etrap bone), and one requiring a body cat lit verse processes) The 3 hup fracture [ or abduction type), and the 3 os coeffit were given the injection in combinate Eleven fractures (ankle, with carpal, and metatarsal) received plasted immobilization in the routine manner were immediately relieved of pain dara. reduction and initial fixation and week benefited by intracaine ointment massel removal of the immobilization One state ture with marked soft tissue swelling outer ankle experienced more pain that after the injection, this was apparently the marked edema which is a control of No untoward were observed in the whole group became painless faster and longer that tic one hour after the injection while the zones over the intracalne injection showed no sign of irritation

In the clinical studies presented below, intracaine was used in amounts ranging from 0.2 to 25 cc. without any untoward reaction. The apparent lack of toxicity of intracaine observed by other workers\*-\* in many thousands of cases, where as much as 50 cc. were used without one single untoward reaction, could be confirmed in these studies.

## Technic and Dosage

The technic follows the general rules of any local anesthetic for regional conduction or segmental anesthesia. Intracaine in oil was avail able m a 2 per cent and a 5 per cent concentration The 5 per cent concentration was preferred in the majority of cases on account of markedly prolonged anesthetic action For surface anesthesia in form of massage a 1 per cent aqueous solution of diethoxin (intracaine base) was employed Intracame in oil was administered by the intramuscular, subfascial periarticular, intraligamentous, penneural, penosteal, paravertebral, and epidural routes The amounts used varied from 0.5 cc. to 25 cc. with an average dose of 3 to 5 cc. which, in some cases, was repeated every day up to ax times during a period of three to four weeks A 22 gage needle was used after aspirating the intracaine with a 19 gage needle

Intracaine in oil was also given by the intraarticular route with the aim of producing an artificial effusion and to cover the damaged cartalage of the arthrite joints with a lubricant, having gradually discharging anesthetic properties. This method had to be abandoned because of undue reactions in form of pain, effusion, and lack of permanent benefit. The periarticular route was used instead with good results since the pain, according to Lenche, does not arise from the cartilage devoid of nerve supply but from the periosteum, the joint capsule, and periarticular structures.

When administering intracaine in oil, it is important to inject the preparation below the subcutaneous layer by deep intramuscular administration as, otherwise, a painful itch may develop In sensitive patients and for paravertebral or epidural block first 15 to 5 cc of aqueous intracaine were used, aspirated in the same syringe with the oily intracaine which collects above the aqueous solution near the plunger when the syringe is kept with the needle downwards. A 'fan-wise" distribution in horizontal oblique, and vertical direction insures the best results and serves to avoid pooling in one tissue level, except in cases treated by conduction anosthesia.

### Clinical Studies

The type and number of cases treated with in tracaine and an evaluation of the effectiveness of intracaine therapy are presented in Table 1

 $L_{ow}$ RackPan-Sacrolumbar-Sacroluae Sprains and Derangements -Since it is very dif ficult and often impossible to differentiate the exact pathology in the absence of positive \(\tau\) ray findings we use the term sacrolumbar and sacroiline topographically for the largest group charactenged by "low back pain" It consisted of 27 men and 13 women The onset of pain was sud den in almost every case and appeared to be brought on by an unguarded motion carried out while standing or sitting Twelve patients of the sacrolumbar and five of the sacrolliac group had sustained similar attacks previously with a dura tion of pain from two days to three months The symptoms were localized burning, deepseated stabbing sensation or diffuse pain across the back, sometimes of an agonizing character, and pain travelling in the groins or down the posterior leg portion which was aggravated by sneez ing and coughing When pain was diffuse and no localized tender areas could be elicited, a paravertebral block was done according to the tech nic of Pitkin.11

Treatment -All patients after the intracame injection were strapped, advised to sleep on a fracture board with a pillow under the knees to keep them flexed In a few cases, use of local, moist heat and analgesics was required sacrolumbar type 15 cases were relieved of their pain by one injection, 6 were greatly improved but required a second and third injection after forty-eight to seventy two hours in combination with traction, physiotherapy and spinal brace Two cases had to be hospitalized on account of severe pain but improved immediately after in jection of 4 cc. of intracaine in oil in combination with 1.5 cc. curare Two patients with pri mary disk symptoms showed no improvement with intracaine and had to undergo surgical pro-No untoward effects were noted ex cedures cept short. Insting drowsiness in one patient who had been given curare.

Ten of the sacrollac type were greatly improved by one injection of intracaine, two received 2 and 3 injections, respectively. Combined treatment (manipulation, traction, brace, physichlerapy), and prolonged hospitalization were required in 4 cases. One case with no improvement turned out to be a protruded disk between LV and SI and was treated by neurosurgery. Two cases with repeated injections showed sparalization and facet anomalies. Of 6 cases

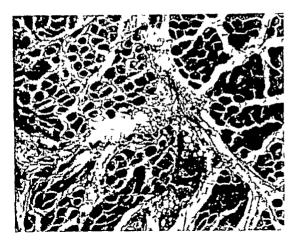

Fig 1 Injection of 0.2 cc of 5 per cent intracame in oil into erector spinae muscle of rabbit, 24 hours later

into the knee joint on the second and sixteenth days. On the twenty-third day the animals were killed by intravenous air injection. Macroscopic examination of muscles and knee joints failed to show any inflammation, the muscle fibers showing normal color, and the cartilage a smooth appearance with interspersed oil droplets. Microscopic examination revealed the histologic picture as seen in Figs. 1, 2, and 3.\*\*

Fig 1 shows that twenty-four hours after injection into the muscle the connective tissue septa throughout the musculature are widened by edema characterized by an abundance of precipitated protein and a well-developed fibrin network. The muscle cells adjacent to the septa exhibit a moderate degree of intracellular edema Large mononuclear wandering cells have accumulated in an occasional septum and there are a few extravasated erythrocytes

\*\* The histologic examinations were kindly carried out by Dr Homer Kesten pathologist White Plains Hospital

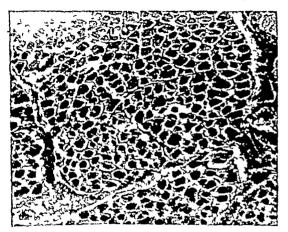

Fig 2 Nineteen days after injection into erector spinae

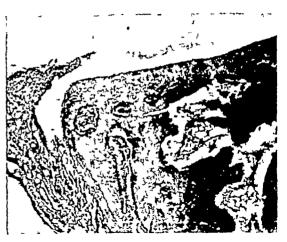

Fig 3 Injection of 0.5 cc of 5 per cent intracaine in oil into knee joint of rabbit, 19 days later

Fig 2, nineteen days after injection, revealed the muscle bundles are spread apart by a quantity of edema fluid containing precipitated protein and a delicate network of fibrin. This tended to extend around individual muscle cells little recent hemorrhage is associated with it Most of the muscle fibers are unaltered save for an occasional swollen, partly vacuolated element At one point several muscle cells have been destroyed (artefact?) and the surrounding and adjacent connective tissue is infiltrated by small numbers of large mononuclear wandering cells, together with polymorphonuclears, and occasional lymphocytes Proliferation of muscle cell nuclei has taken place in a few of the remaining fibers about a focus of infiltration

Fig 3 shows that nineteen days after injection into the knee joint the periarticular tissues are free of inflammatory reaction. The joint space is empty. The joint capsule and the articular surfaces are smooth without evidence of degeneration or inflammation.

The author carried out tests on himself in order to make a comparison between the effect of procame in oil (5 per cent) and intracame in oil (5 per cent) Some difficulty was experienced in completely dissolving the procaine crystals in almond oil The volar side of the left lower arm was injected intradermally with 0 1 cc each of the two substances forming wheals of 1/2 inch diameter and tested by needle prick as to the anesthetic effect after one, two, three, and four hours While the procaine effect subsided after less than two hours, the intracaine effect was still present after four hours in the form of anesthetic spots over the wheal area and an area of anesthesia along the ramus superficialis of the radial nerve, slight but quickly subsiding itching was noticeable after six hours The procaine wheals became hyperesthegroups treated with novocaine. This was especially striking in the rib transverse process and coccyx fractures.

Burntus -This group represents 14 cases of subdeltoid bursitis type (four complicated by penarticular fibrosis), 2 cases with local tenderness over the subacromial region one with the trigger point over the corncoid region, 3 cases of burnitis subtrochantene and one infrapatellar Srx individuals had suffered previous similar attacks lasting from one to fourteen days The symptoms were pain around the affected area with sharply defined trigger points, muscle spasms, various degrees of joint fixation up to complete limitation and pain travelling down the upper arm. No definite pathologic anatomic diagnosis could be made, but fluorescopy showed the presence of calcareous deposits with small deposits in eleven subjects causing usually more pain than large ones The patients with shoulder involvement felt particularly uncomfortable generally

Treatment -All cases after injection of 1 to 3 cc. intracaine were gently manipulated in all planes to insure thorough oil distribution. The shoulder patients were advised to wear a sling for twelve hours, the others to stay off their feet for one day In the presence of deposits thorough needling was done. Additional routine therapy consisted of application of icebags, phenaphen or demerol medication. Of the 14 shoulder cases, 8 were greatly improved by one intracaine injection, 6 showed improvement but needed repeated injections with smaller amounts after forty-eight and seventy two hours, and other therapy The 2 trochanteric burnitis cases required one injection only as well as the infrapatellar and subcoracoid bursitis. In those cases where presence of calcium could be demonstrated under ethylchloride spray 1/2 to 1 cc. of intracaine was injected into or around the tender area. with the needle in place the syringe removed, a thorough needling in all directions was done followed by another injection of 1/2 to 1 cc. intracame underneath and around the calcium de-In some cases the pain recurred after four to ax hours but wore off during the following ax hours One case of frozen shoulder, while under anesthesia, was administered 5 cc. of intracaine beneath the capsule and subdeltoid space followed by gentle breaking up of the adhesions. No toxic effects were noted in this group Lately we have used the suprascapular approach,11 with encour

Arthrits.—Of twenty arthritis cases ranging from 21 to 63 years of age, twelve were of the non inflammatory, degenerative hypertrophic type and eight of traumatic origin. While the first group gave a history of affliction of months and

aging results

years the traumatic arthritis had persisted only a few days or weeks. Nontraumatic arthritis in cluded the following types ankylesing spondylearthritis, malum come hypertrophic arthritis of the knees, and arthritis of the big toe joint. Traumatic arthritis involved the knee wrist, foot in combination with synovitis and capsular ligamentous tears. Symptoms in both groups were pain and limitation of joint motion. Arthritic changes were demonstrated in the form of diminished joint space, selerosing joint borders spurring fraying, decalcification. The blood count and sedimentation rate were found normal.

Treatment -Intracaine (2 or 5 per cent solu tion) was used in amounts of 2 to 6 cc depending upon the size of the area. In ankylosing spondyhtis the painful muscle spasm with involvement around the facets or the intervertebral junctions was greatly relieved after injections twice weekly for a period of three to six weeks. The resulting disappearance of tightness allowed easier appli cation of other physic- and orthopedic procedures. The same degree of improvement was experienced in the cases of malum covae where periarticular injection of 3 to 5 cc of intracaine by ilio-inquinal or supratrochantene approach produced considerable relief of pain and lessening of the flexion-adduction contracture for twelve hours lasting up to one week.

During the painless period physiotherapy, manipulation, casts, or braces were applied without discomfort. Two cases did well for four months without any additional therapy. Of the nine cases of knee arthritis, the six of traumatic origin were relieved of pain and muscle speam after one or two periarticular injections of 2 to 3 cc intracaine the others requiring additional in jections and physiotherapy or temporary cast immobilitization.

Three patients with involvement of smaller joints were free of pain after one injection of 1 cc. In two cases the intra-articular injection of intracaine into the knee caused increasing pain and effusion. Although no other reactions ocured and histologic findings in animal experiments failed to show signs of synovial irritation or cartilaginous damage it is felt that intra articular injections should be restricted to small joints and using only a few drops of intracaine.

Confusions—Muscle tears—In this group there were 13 patients, all with a history of a sudden twist or bend with severe local pain, muscle spasm, and different degrees of disability. They were first sprayed with ethylchloride and then impected with 1 to 3 cc. of intracaine in oil (sometimes preceded by an aqueous solution of intracaine) deep intramuscularly at the most tender area, followed by tight strapping and rest with recompresses for twelve hours. Nine patients did

not require any further treatment, three required longer bed rest and repeated injections, and one wore an Unna boot for four weeks

Supraspinatus tear—Five cases of partial supraspinatus tears occurred suddenly after lifting, causing shoulder pain which varied from sharp localized constant pain over the supraspinatus insertion to occasional attacks persisting for many months and aggravated by lifting the outstretched arm between an abduction angle from 20 to 70 degrees. There was, in the older cases, atrophy of the upper shoulder girdle and diminished muscle power. Two cases had been treated with physiotherapy for many months without noticeable relief.

Treatment —An injection of 1 to 2 cc intracaine was given over the posterior-lateral aspect of the musculotendinous cuff by directing the needle along the supraspinatus course toward the greater tubercle. All patients were advised to avoid abduction movements. In three cases the severe pain subsided with some pain on heavy lifting. One patient was completely relieved after two injections at four days interval, one patient showed relief for more than six hours but experienced increased pain necessitating immobilization in shoulder spica for four weeks.

Neurous —Because of the difficulty to establish a definite pathologic diagnosis, all patients with pain along the root or course of nerves and absence of other signs were labeled as having neu-Most of them gave a vague history with insidious onset of varying intensity lasting for weeks or months of burning or stabbing character There was tenderness along the nerve distribution with zones of hyper- or hypo-esthesia In several instances the pain was of symptomatic nature with underlying primary pathology later diagnosed as protruded disk, scalenus syndrome, amputation neuroma, or arthritic changes, one of which was found to be a spreading metastasis of an hypernephroma, one was a myeloma clinically impressing as intercostal neuralgia

There was a brachial neuritis in a menopausal overweight patient, one of the meralgia paresthetica type, two genuine sciatica, and seven symptomatic neuritis. In all cases complete medical and x-ray examination was carried out, including blood count chemistry and internal examination, before the diagnosis of a genuine neuritis was established.

Treatment — Intracaine injections varied between 2 and 20 cc in combination with 5 cc of the aqueous solution in doses above 10 cc of the oily solution. The high doses of 20 cc were used for epidural anesthesia in the 2 cases of sciatica, in another case 10 cc were used for injection around an amputation neuroma. Satisfactory results were obtained in one case of neuralgia.

paresthetica, one case of brachial neuritis, in the amputation neuritic patient, and in 2 sciatic cases, while the two sciatic cases due to protruded disk and the other types of neuritis obtained temporary relief only. This group has to be considered the most unfavorable as far as complete relief from pain is concerned.

Myofascial Pain — The thirteen cases which had to be labeled as myofascitis exhibited localized or radiating pain of different degree with limitation of motion due to muscle spasm and a duration of between a few hours and a few days Pain appeared either gradually or suddenly and, in most cases, no reason could be advanced for its appearance. In four cases the cervical region (occipital and upper trapezius) was affected, in six the back (mostly between the shoulder blades or in the iliolumbar area), in two the trochanter region along the tensor fasciae, and one patient presented myofascial symptoms over the upper calf

Treatment —A dose of from 2 to 5 cc intracaine in oil was injected "fanlike" into the tender area beneath the fascia and deep muscle layers. In place of strapping, frequent hot baths, with subsequent perspiration, and high doses of salicylates were advised. Of this group 8 individuals had immediate and lasting relief after one injection, 4 were very much improved in combination with physiotherapy, and one obtained short, lasting relief. There were no untoward reactions.

Epicondyltis—Periostitis—Of the eleven cases of epicondyltis and periostitis, five were due to acute and four to chronic trauma, and two developed spontaneously. The symptoms varied from slight pain, increasing on certain motions to constant aching, local tenderness, increased skin temperature, swelling, and limitation of motion with soft tissue shadow or periosteal thickening visible in the x-rays. Pain lasted from two days to two months. Four cases affected the medial humerus epicondyle, two the lateral, one the lateral midulnar region, two the midtibial ridge, and two the inner femoral epicondyle.

Treatment—Intracaine in oil, 1/2 to 11/2 cc, was injected into the painful area toward the periosteum, in very painful instances complete immobilization and icebags were advised for twenty-four hours. In one case the injections were repeated three times. Eight patients were cured after one or two injections, two markedly improved continuing with physiotherapy, and one showed only temporary improvement requiring radiotherapy. No unfavorable reactions were noted

Legamentous Injuries —The rather small number of patients is accounted for by the fact that we considered for intracaine treatment only those cases showing absence of marked, soft tissue

swelling over a large area, the presence of which is a contraindication for this kind of therapy. The cases treated experienced sudden onset of pain after turning an ankle or twisting a wrist Four involved the knee region (collateral tibial or fibular ligament), four the ankle (medial and lateral), and one the wrist.

Treatment —Only small amounts of intracaine (0 4 to 2 cc.) were injected deep into or under the ligamentous area in "fanlike' fashion followed by normal activity of the patient. Six patients obtained complete relief after the first injection one showed improvement which was followed by strapping and physiotherapy, and two required immobilitation (east)

Contractures — This group is of special interest since we noticed considerable improvement after intracaine injections which were in several instances, combined with curare (intocostrin-Squibb) administration. Three cases of recent poliomyelitis, one with marked pectoralis contracture and two with hamstring spasm, showed relief of muscle spasm for ten to twenty four hours following an injection of 2 to 3 cc intra caine in oil The same, or even longer relaxation, was observed after a second and third injection. Painless, passive motions and more favorable positions of the extremities involved became possible In two of these cases the intracaine injection was supplemented by intocostrin (1 co every third day)

Four cases of cerebral palsy, with flection-pronation contracture of the arm and equinus deformity of the foot of three months to three years' duration, were given repeated intracaine injections (one to two times weekly for four weeks). A dose of 2 to 3 cc was injected into the pronator group and the same amount into the calf muscles. This injection resulted in immediate, marked relief of the muscle spasm and increased range of motion. The slurring gait was improved the patients were better able to undergo passive manipulations and fixation in splints was maintained without difficulties. In two cases we combined intracaine with intocostrin producing an apparently prolonged effect.

Three cases of Little's disease with marked adductor spasm also showed considerable relief of spasm after injection of 1½ to 2½ oc of intracaine in oil into the adductor group. These petients were children between 0 and 11 years of age. Following the injection, the adduction contractures duminished immediately. The angle of abduction could be increased 10 to 20 degrees on manipulation, and hydro- or physiotherapy which followed gave more favorable results than without the injection. The relief lasted from six hours to two days in two cases and was observed again

after a second and third injection. The third child, a very emotional patient who objected strongly to the injection obtained no improve-

In general all these three groups showed diminution of the local contractures and allowed more effective physiotherapy or manipulation. The therapeutic effect could be enhanced and was prolonged by administering simultaneously curare. No complications were noted with intracaine therapy.

Tendorogrants.—Two cases of tendovaginitis were of the stenosing type (Quervain) along the flexor pollicis tendon, one with signs of locking Both were completely relieved after one injection of 1 cc, intracame into the tendon sheath.

## Summary

- 1 Intracane in oil is an effective anesthetic with prolonged analgesic action. It is an ideal therapeutic agent for certain painful conditions of the musculoskeletal system and provides for combination with other therapeutic procedures. It gives encouraging results for the relief of muscle spasm of cerebral palsy and poliomyelitis, sometimes in combination with curare.
- 2 Although the exact mechanism of lasting therapeutre analges in not definitely known analgesic injections are believed to restore a normal vasomotor equilibrium by eliminating pain impulses, musculoskeletal pain in great part assumed to be due to vasospasm. The presence of an intracellular edema persisting throughout musculature and connective tissue for a long time seems to be an important contributing factor in the prolonged intracame anesthosia.
- 3 Intracaine in oil (5 per cent) was used in 180 patients with orthopedic and traumatic disorders. It was found especially valuable in the treatment of low back pain due to sacrolumbar and sacroliac derangements in fractures bur sits, contusions, muscle tears, myofascitis, epi condylitis periostitis, certain ligamentous injuries, tendovaginits and also in contractures of spastic or mechanical origin. It also benefited cases of degenerative arthritis and neuritis.

Of all cases treated with intracaine in oil, about 50 per cent were permanently free of pain and about 40 per cent were able to receive other therapy (physic-manipulation traction casts, braces) while the acute and predominant pain was controlled by the anesthetic agent. Ten per cent were not improved

 Intracame ointment was successfully applied for massage of painful muscles after injury and immobilization in casts.

It was used with equally beneficial results in

painful skin wounds and in burns producing a prolonged and comfortable analgesic effect

Intracaine is well-tolerated in man and the absence of toxicity demonstrated by other investigators could be confirmed in these studies

## RESULTS OF SLEEPLESSNESS

Going for five days and nights without sleep can make a healthy young man "see things," laugh and talk orazily, and show other symptoms of the serious

mental disease, schizophrenia

But one night's sleep restores the voluntary victim of sleeplessness, or insomnia, to normal, Dr David B Tyler of the Army Chemical Center's Medical Division at Edgewood, Md, Arsenal reported at the American Medical Association's centennial meeting in Atlantic City

Hundreds of soldiers, marines, and conscientious objectors took part in the studies, made to learn how long men in combat could stay awake and remain

efficient fighters

Better understanding of mental disease may come

from clues furnished by the study

"We feel there is a relation between the mechanism in the brain that produces changes as a result of sleeplessness and the mechanism that produces

the disturbances in schizophrenia," Dr Tyler said
All the changes produced by the five days and
mights without sleep were confined to the brain They showed up after about thirty-six hours of sleeplessness Seeing double, hallucinations, irritability, unreasonable laughter and irrelevant conversation, memory deterioration, and remarks made as if the men were in a dream state were the signs of mental change

Brain-wave records also showed the effects of

the long time without sleep

Heart rate, blood pressure, body temperature, visual ability, and capacity to do physical work were not impaired by the prolonged period without sleep The men actually gained weight, but this was because they were given a fourth meal at midnight

Reaction time and steadiness were just as good on short tests, but fell off when the tests were pro-longed Benzedrine, familiarly known as "pep longed pills," prevented the deterioration in performance when it was given after the second day If given from the start of the five-day sleepless period, it was Its action came through its ability not effective to help the men stay awake while performing the tasks.—Science News Letter, June 21, 1947

## SURVEY MEDICAL EDUCATION

Plans are now underway to make the comprehensive survey of medical education recently authorized by the AMA Board of Trustees The AMA Council on Medical Education and Hospitals will be joined in the survey by the Association of American Medical Colleges The A.M A. council and the executive council of the college association already have discussed plans for the survey at a joint meeting, and a temporary planning committee, consisting of three representatives of each group, has been appointed

The AMA council is being represented by Drs H G Weiskotten, Syracuse, NY, Victor Johnson, Rochester, Minn, and Donald G Anderson, Chicago The college association representatives are Drs A C Bachmeyer, Chicago, Joseph C Hinsey, New York, and Walter A. Bloedorn, Washington

In view of the recent advances in medical knowledge and the nature of medical care, a careful reevaluation of the curriculum of the various medical schools is planned.

## TOWN HALL ANNOUNCEMENT

Town Hall of New York City will present six of the nation's outstanding psychiatrists in a series of lectures on "Modern Psychiatry" beginning Monday, October 20, at 5 30 in the Town Hall auditorium, 123 West 43rd Street

Among the participants from New York will be Dr Carl Binger, associate professor of clinical psychiatry, Cornell Medical College, and editor of the Psychoanalytical Quarterly, and Dr Thomas A. C. Renme, attending psychiatrist, New York Hospital, and associate professor of psychiatry, Cornell University Medical College

Dr Binger will speak on "What is Mental Health?"

and Dr Rennie, on "What is Psychotherapy?"

## MEDICAL CONSIDERATION OF THE AIR TRAVELER

FREDERICK HOPKING SHILLITO, M.D., New York, New York

INDUSTRIAL physicians irrespective of the nature of the employee group for whose health they are responsible, must be sufficiently informed on flight conditions so that they can answer the question presented by the individual, "Can I fly?"1 It has proved feasible and economic for industry to transport large groups by air, particularly when an emergency demands teams of especially trained technicians at some trouble point. In addition, executives and business men frequently use airline facilities for travel It is unusual for a company not to have some individuals who fly occasionally When concerned about some acute or chronic ailment, these persons will consult first their own company physician about the ad visability of a contemplated flight The mind of the employee can often be relieved by direct answers to questions

The physician's sound and sensible judgment is sufficient to decide most of these cases. It is not necessary that the industrial physician be a specially trained flight surgeon—Usually the important decision is whether or not the patient is able to stand the trails and vicisatudes of any kind of transportation—the mere fact that the proposed mode is a commercial airliner is not of special agnificance. Important strides have been made in improving flight conditions for the passanger, and physiologic strain has been minimized greatly. In comparison with earlier days, now all but an extremely small fraction of the population can be totally unconcerned about any possible health hazards of air travel

Airlines are now in the process of procuring larger and faster planes which will cruise at higher altitudes To the physician who is considering whether or not his patient can fly safely, it is important to realise that these new planes have the benefit of "pressurrection" The industrial physician should understand the principle of this device. To state it succinctly, in 'pressurization" outside air is compressed and pumped into the sealed passenger cabin, thereby increasing passenger comfort Actually the passenger will not even realize that his plane is pressurized unless he is told so The important point is that the passenger is not forced to accommodate to the outside or ambient pressure, since a normal atmosphere is created for him For instance, when a plane is flying at 18 000 feet, atmospheric pressure is 7.34 pounds per square inch. In a cabin built to withstand 7 pounds pressure, sea level conditions can be maintained even if the plane is flying at 18,000 feet, with 3 pounds pressurization, the cabin pressure would be approximately that of 9,000 feet instead of 18 000 feet.

In addition to pressurization, which is probably the most important step in passenger comfort which has ever been taken by the airlines, improvements have been made in accomplishing amoother flight by the use of heavier equipment, sound proofing of passenger cabins, the serving of palatable and hot meals more comfortable seats, and many other matters. All extreme strains and dangerous flight situations are meticulously avoided. In war, certain missions were undertaken and accomplished in spite of the risks. Commercial airlines, of course, are striving to their utmost to maintain schedules but will not do so if the safety of any passenger or crew member is placed in jeopardy.

Airplane flights for the normal healthy man, woman, or child can be approved by the industrial physician without the slightest hesitation True such individuals undertaking their first flights sometimes will be apprehensive Service can be rendered these persons by reassuring them of the safety of air travel In this regard, the fact can be mentioned that the airplanes have amassed hundreds of millions of passenger miles and that this mode of travel is well established as a public service. It is no longer in the experi mental stage More specific problems for the industrial physician come up when he is asked "Can I fly?" by employees who are suffering from some specific acute or chronic disease or who have some physical disabilities

## Specific Problems

Sinuses and Ears.—The presence of perforation of the ear drum is no contraindication to passenger air travel A recently healed perforation might be reopened if equalization of pressure through the eustachian tube is not watched carefully Infected sinuses are often emptied during ascent but the narrow ostia may close during descent. This event will cause pain over the affected sinus or in the teeth (aerodontalgia) Any individual with chronic infection in the sinuses should be provided with nasoconstrictor nose drops or inhalors to use in the nostrils before descent.

Acute upper respiratory infections (especially in the early stages when congestion is a promin ent feature) are a cause of swelling at the orifices

Presented at the 141st Annual Meeting of the Medical Society of the State of New York, Buffalo Section on Industrial Medicine May 8, 1947

of the eustachian tubes. This condition may block the equalization between the middle ear and ambient pressure. Nasoconstrictor drugs should be used periodically, both before ascents as well as before descents, in order to keep the eustachian tubes fully patent. Distortion of the drum produces aero-otitis. This condition clears spontaneously—although many flight surgeons advocate politzerization or the Valsalva maneuver as soon as the condition is apparent.

Cardiac Conditions—The etiologic and anatomic diagnosis is less important in contemplation of a trip by plane than is an appraisal of cardiac reserve—Sitting quietly in a seat in a plane at altitudes usually flown is no more strenuous for the patient than moderate exertion on the ground

The ambulatory cardiac will not usually be embarrassed in any way by a flight. In anginal failure, it must be remembered that the usual travel details of carrying bags or hurrying for connections at terminals may impose sudden strain and produce anginal pain. Patients with low cardiac reserve who are unable to walk short distances without inducing congestive failure should not be exposed even to the relatively slight strain of 8,000 feet altitude. Such patients can travel by air if oxygen is administered, but this is a therapeutic problem and is not met by the presence on the plane of oxygen furnished for emergency use

Anemia —Persons with a moderate degree of anemia are able to tolerate the usual cabin pressures without difficulty Individuals with marked anemias, with red blood cell counts below 2.5 million, will experience tissue anoxia at even relatively low altitude. Such persons should be transfused to satisfactory levels of red cells before traveling.

Pulmonary Conditions —Conditions which lower pulmonary function, such as diffuse fibrosis, must be evaluated in terms of respiratory reserve Little difficulty in such air travel will be experienced except in cases where even moderate exertion at sea level causes marked dyspinea. The person with asthma is a problem when an acute attack is precipitated while aloft. Oxygen should be available to be used in such an emergency. The clean and slightly rarefied air of the airliner cabin, however, is not especially apt to precipitate an attack.

The physician should bear in mind that there is great danger for the pneumothorax patient in flying. At 10,000 feet altitude, the volume of air increases nearly one and one half. Serious, even fatal, accidents can result due to shifting of the mediastinum or tearing of adhesions. Releasing pressure in a pneumothorax by aspiration could be employed by a physician in order to prepare a

patient to fly, but even this procedure is not altogether safe as there may be areas of incapsulated gas in pockets which do not communicate with the main pneumothorax

Dowds has reported a fatality occurring in an airline passenger which resulted from overexpansion of a pneumothorax due to decreased barometric pressure during flight The accident occurred due to the fact that the patient apparently was unaware of the danger Suffering from tuberculosis, pneumothorax therapy was instituted in 1943 with a 200-cc refill on March 28, 1945 At 2.05 A.M March 31. he boarded a plane An altitude of 11,000 feet was reached without discomfort At 16,000 feet, he became cyanosed and dyspneic, and unconsciousness supervened During descent, cyanosis cleared at 5,000 feet He was removed to a hospital where coma and convulsions continued until his death At autopsy, the right lung was found half collapsed and the brain was edematous In this case, air emboli or cerebral anovia may have been the cause of death as obvious damage to the thoracic organs could not be demonstrated

Pregnancy —Any woman in the pregnant state, of course, is liable to spontaneous abortion, miscarriage, or premature delivery for a variety of causes. There is nothing inherent in the pregnant state which specifically contraindicates air travel at moderate altitudes. Until the last month of a normal pregnancy a woman is usually permitted to travel by air without question. During the last month, no air trip should be undertaken without an examination by the attending obstetrician, who should approve the trip in all details

Recently, on a transocean plane, a stewardess was informed by a pregnant passenger that labor pains were commencing Rupture of the membranes occurred spontaneously and prematurely sibly this event delayed the progress of labor plane was two hours from the nearest port lowing instructions given during her training course, the stewardess arranged for the patient to lie down Any possibility of contaminating the perineum was avoided by meticulously avoiding any manual examination of the perineum Labor pains in creased in frequency until they were timed at fiveminute intervals and preparations were made to attend the delivery A landing of the plane was made, however, and the patient was placed in a hospital under the care of a physician Delivery of twins occurred about eight hours after admission to the hospital

Motion Sickness —The incidence of thismalady, admittedly caused by emotional factors as well as by movement of the plane in flight, is decreased by the use of large steady planes and by pilots avoiding turbulent air. The physician has a host of remedies to employ, utilizing sedatives, atropine, or hyoscine in appropriate doses

Psychoses —The transportation of a person with a psychosis by air or any other means is a difficult problem In the event that a patient is accepted as a passenger, he must be attended for the entire trip by a medical aid who is able to cope with behavior which can bring harm to the patient himself or to other passengers

Recently a transocean passenger was accepted for passage showing no untoward behavior the flight, however, he became maniacal cal attention at every intermediate state was required, and it was necessary to use restraint for

the latter stages of the flight.

October 15 1017]

Transportation of Infants -Bables telerate air travel very well. The schedule is disrupted to the minimum by the rapidity of the journey Equalization of air pressure between the ears and pharynx is rapid due to the shortness of the custachian tube and wideness of the ostia physician should advise the mother to prepare formulas and carry the bottles in iced containers. The bottles can be warmed just before each feed

Epidemiology —Persons with communicable and infectious diseases should not be approved for travel until all danger of contagion is over The physician also, should be constantly aware of problems of diagnosis in the patient who recently has returned to this country from abroad.3.4 Conditions such as malaria or typhus are epidemic in foreign ports. The patient may have returned in one day to this country from a distant area where he was exposed to such conditions. At the time of onset of symptoms at the end of the incubation period, the possibility of the previous exposure which geographically seems so remote may be overlooked

### Summary

Commercial air travel is recognized generally as a comfortable and rapid means of transporta Questions do arise in the minds of medical patients as to whether or not air travel is contraindicated for their particular physical ailment. With the development of partially pressurized large planes, the fact is that only an exceedingly small number of patients should be forbidden to fly on medical grounds. The personal or industrial physician is able to make the decision, when questioned, on the basis of an understanding of the basic facts of flight physiology

Until planes are fully pressurised, so that cabin pressures can be maintained at sea level conditions, a flight does require adaptation to rapid changes in barometric pressure usually up to an altitude of 8,000 feet The adaptability of the body allows the normal individual to fly at such altitudes without any deleterious effects or discomfort A discussion of some common conditions which usually give rise to questions includes conditions of the sinuses, ears and nasopharynx. heart disease, anemia, pulmonary conditions (including the grave danger to the pneumothorax patient), and pregnancy These have been discussed briefly

## LOW MORTALITY FORECAST FOR 1947

Barring unforeseen developments for the remainder of the year, it now appears that 1947 will set a new low record for mortality among the industrial policyholders of the Metropolitan Life Insurance Company with the death rate for the first six months of the year, 76 per 1 000 policyholders, ranking 8.8 per cant below that for the like period of last year

One of the factors contributing to the favorable record so far this year is the low mortality from influenza and pneumonia, achieved despite an un seasonable rise in the death rate from those diseases in the spring Fortunately this outbreak was shortlived and by June the death rate from influence and pneumonia was at a new low the figure for the first six months being 13 per cent below the previous minimum for this period of the year established in

Tuberculosis, too is making an excellent showing in 1947 Each month, except May registered an appropriably lower death rate from the disease than did the corresponding month of 1948, and the rate for the six months is 35 per cent under the rate ten years ago. New minimum rates have also been established so far in 1947 for syphilis appendicities and the principal communicable diseases of childhood as a group The decline in mortality from syphilis has amounted to almost 30 per cent in the past decade and from appendicitis more than 70 per cent. The death rates from measles, scarlet fever whooping cough and diphtheria together add up to less than 1 5 per 100 000 policyholders

The death rate from the diseases of the puerperal state for the first half of the year is 3.2 per 100 000 as compared with 3.1 for last year although the birth rate has increased by about 40 per cent. Like-wise with a favorable record this year are the diseases characteristic of later life. The mortality from the cardiovascular-renal diseases has declined 1.2 per cent as compared with last year and diabetes shows a drop of 5 per cent. Cancer alone registers an in-creased mortality on the basis of rates not adjusted for the aging of the insured group—Metropolitan Lafe Insurance Company Statistical Bulletin, July 1947

# CHRONIC OSTEOMYELITIS IN WAR WOUNDED A REPORT OF TWO VETERANS DISCHARGED WITH INTRACTABLE OSTEOMYELITIS AND SUCCESSFULLY TREATED WITH LOCAL PENICILLIN-DETERGENT THERAPY

E J Grace, M.D., F.A.C.S., Brooklyn, New York, and V. Bryson, Ph.D., Cold Spring Harbor, New York

(From the Grace Clinic, Brooklyn)

IN PREVIOUS publications we have emphasized the urgency of not resorting to radical surgery in the treatment of chronic osteomyelitis unless the infinitely simpler approach of using, topically, penicillin with a detergent (Aerosol O T 01 per cent) was tried first 12 We stated that either by puddling this solution into the wound, or injecting it into the sinuses of the osteomyelitis, many cases could be cured and the ordeal of mutilating surgery, so often resorted to in the preantibiotic era, elimi-Although this approach has been helpful in many cases, it did not cure all, and a successful surgical procedure of a minor nature is now employed by the senior author in the majority of the most intractable cases This procedure merely consists in excising the sinus tract down to the diseased cortical bone, curetting an opening into the medullary canal, or, if it is too firm, drilling a large hole in order to insure the area in the medullary canal being large enough to insert a T-tube in order to maintain in this area, for ten days, a constant pool of penicillin dissolved in the detergent solution used is as follows 50 cc of Aerosol OT 01 per cent are used to dissolve 1,000,000 units of penicillin, and of this solution, 1 or 2 cc are injected every three hours When inserting the T-tube, care must be taken to be certain that the long axis of the inserted portion of the tube lies in the medullary canal parallel to the long axis of the bone soon as the bone is exposed, 2 or 3 cc of penicillin with Aerosol are injected into the infected area so that subsequent bone trauma is relatively sterile

A T-tube is not always practicable, since in chronic osteomyelitis the normal anatomy may be so modified that adequate amounts of penicillin cannot filter through the medullary canal. Therefore, in badly diseased cases, it is sometimes necessary to insert instead a rubber catheter. Irrespective of which is used (tube or catheter), it is tied to the skin by a suture and left in place for the ten-day period, during which time the penicillin-detergent solution is injected every three hours, as outlined above. A small amount of pressure is applied through the syringe, when injecting the detorgent and penicillin, to insure its deposition in the medulary canal.

The unlimited benefit that might accrue to many patients suffering from osteomyelitis in military hospitals throughout the world, as a result of war wounds, prompts us to report the cases of 2 World War II veterans, discharged from military hospitals, suffering from intractable chronic osteomyelitis with a purulent discharge and a disability directly related to this disease

Administration of penicillin dissolved in Aerosol

OT 1 1000 (dioctyl ester of sodium sulfosuccinate) is based on the observation that aqueous solutions penetrate bony tissues more readily in the presence of the detergent, presumably because of the reduced surface tension and increased lipoid solvent properties of the solution In addition, Aerosol OT has a synergistic effect on penicillin Among representative gram-positive and gram-negative bacteria commonly found in old wounds and osteomyelitis, only Pseudomonas pyocyanea will grow in proteose number 3 agar enriched with blood and containing 10,000 units of penicillin in Aerosol O T The following bacteria are killed or inhibited when tested against the penicillin with de-Staphylococcus aureus, Streptococcus viridans, Bacillus subtilis, gamma streptococcus, Proteus vulgaris, beta hemolytic streptococcus, Escherichia coli, Corynebacterium, and Neisseria catarrhalis The only one not killed or inhibited was Pseudomonas pyocyanea

Case 1—R R, aged 29 About 1927, patient had onset of swelling in right heel Since that time, has had 18 operations for condition Notwithstanding his previous history, the boy was taken into the armed services and subsequently operated on in military hospitals on 2 different occasions. He was discharged from the service on July 22, 1943, and after that, operated on in a private hospital. He was first seen by us on June 11, 1945, with a chronic draining sinus from an osteomyelitis of the os calcis

X-ray findings on June 13, 1945, of the right foot and lower leg revealed chronic osteomyelitis of the os calcis and the cuboid bones with complete fusion There were no visible sequestra

Culture was made on June 19, 1945 Broth—Staphylococcus, culture—Staph aureus, slightly

pigmented and moderately hemolytic

This patient had local instillation of penicillin through a needle down to the cortical bone in our original treatment. The disease recurred. However, when the short sinus tract was removed and an opening in the bone made adequate for admission of a catheter, the discharge stopped very promptly and the sinus remained closed. This boy is now working steadily and the lame gait associated with this osteomyelitis has disappeared, along with a cane.

Case 2—L G, aged 27 In August, 1944, this boy received a shrappel wound in the right leg that perforated the upper portion of the tibia 4 centimeters below the knee joint. In the field hospital he was given penicillin and was immediately operated on. His leg was put in a cast for a week On 3 later occasions he underwent operations in military hospitals, both abroad and in this country. He was finally discharged with a draining wound and chronic osteomyelitis.

X-ray findings on October 11, 1946, revealed the

right knee having a chronic esteemyelitis of the head and upper shaft of the tibia, a large cavity with a large sequestrum in the head of the bone, and a moderate indirect joint involvement.

A culture was done on August 22 1946 The culture from osteo sinus right leg revealed Staphylococcus albus (nonhemolytic) Proteus predomi

nated.

The magnitude of the damage done to the proxi mal end of the tibis, from which purulent discharge was exuding from both the wound of entrance and the wound of exit made it necessary to drill a hole through the cortex of bone into the medullary substance of the injured tibia and insert a catheter (wound of entrance) In the wound of exit it was merely necessary to curette through the thin cortical bone and readily insert a T tube Into both tubes 2 cc. of Acrosol O T 0 1 per cent containing 40 000 units of penicillin (20 000 units per ce) were in serted every three hours for ten days.

Three weeks following the patient's discharge from the hospital on September 14 1046, the wound was closed. Although roentgenographic evidence shows damage to the joint surface of the injured tibia, we feel confident that danger of lameness and permanent joint damage are now removed because the underlying ostcomyclitis is controlled B) has previously noted that with a deter gent the efficiency of penicillin is greatly increased by synergism, and it is worth noting that in this patient with a gram-negative Proteus infection the response to penicillin used in this manner was ex

## Summary

Provious experience with a series of 37 patients, suffering from chronic osteomyelitis in civilian life, has stimulated us to urge the same plan of therapy for the treatment of war wounded. Excellent results followed the use of this nonradical method in treating 2 veterans discharged from military service with intractable estcomvelitus.

With the advent of that important antibiotic penicellin, we must realize that an era of surgical practice has arrived that demands a complete reorientation of older forms of surgical procedures It appears possible that the mutilating treatment of ostcomvelitis by radical surgers and cauteriza tion is outmoded and should be replaced by conservative procedures employing antibiotics, as in the method described in this report.

### DIVORCES MOUNT TO PEAK IN 1946

The long term upward trend in the frequency of divorce in the United States not only continued but actually accelerated during the war and the early postwar period It is estimated that there were more than 020 000 divorces granted in 1946 more than 11/2 times the number granted only two years carlier and almost double the figure for 1942 This means that the increase in the four years between 1942 and 1940 nearly equaled the increase from the

beginning of our history until 1942 In analyzing the statistics on this major social problem it would be instructive to know the facts with regard to individual states, but, unfortunately for quite a few of the states data on the annual num ber of divorces are not separately available. The Metropolitan Life Insurance Company through a questionnaire survey and from other sources has obtained statistical information on the number of divorces granted in 31 states and the District of Columbia for the years 1940-1940 for 16 additional states data have been gathered for selected counties, South Carolina issues no divorces at all.

Of the states for which data are available Nevada showed the largest rise between 1940 and 1946. The number of divorces there increased by practically

300 per cent in this short period from almost 5,200 300 per cent in this short period from almost o, 20,550 in at least three additional states— New Vexico Alabama, and Oregon—the number jumped by more than 200 per cent. At the other end of the scale are four states—South Dakota, Montana Virginia Wyoming—and the Dakrota, of Columbia an which the number of divorces rose by less than 100 per cent between 1940 and 1946

The figures on divorce include annulments but the latter constitute only about 4 per cent of the total legal dissolutions for the country as a whole In California and New York however annulments play a much more prominent role in some countries exceeding the number of divorces in the total of marital dissolutions.

There are definite indications that the divorce rate in 1947 will be materially below the peak established last year but there is little reason to believe how over that the long term upward trend in the divorce rate has been halted much less reversed country urgently needs to give much more attention than it has in the past to compose demestic difficultios constructively and to retard the grinding of the divorce mills —Metropolitan Life Insurance Company Statustical Bulletin July 1947

## MEDICAL DIRECTOR WANTED

The Association for Advancement of Research on Multiple Sciercals Inc. Academy of Medicine Bulking, Fifth Avenue and 103rd Street, New York City 29 New York seeks a fulltime medical director to survey and stimulate research activity in the field of multiple scierosis to assist in the organization of a rapidly-expanding institution and to aid generally in its activities. The organization has an outstanding medical advisory board A neurologic or psychiatric background is desirable but not neces-A neurologic or sary, the director must be able to travel salary will be commensurate with ability and experience.

## ESCHERICHIA COLI MENINGITIS TREATED WITH STREPTOMYCIN

Hyman Lieberman, M.D., Brooklyn, New York

(From the Department of Pediatrics of the Israel Zion Hospital)

ESCHERICHIA coli meningitis is a rare and fatal It is most common in infants under three months of age,1 causing 30 to 50 per cent of the meningitides In older age groups its incidence 18 very low,2 one case in about 300 to 700 cases of meningitis (03 to 014 per cent) Shields states that in a ten-year period 776 cases of meningitis were admitted to the Charles V Chapin Hospital. without a single case due to Esch coli. In the 108 reported cases of Esch coli meningitis collected up to 1942 by Barrett, Rammelkamp, and Worcester.4 the gross fatality was 78 per cent, eight per cent recovered with complications and only 14 per recovered completely Among these were five cases treated with sulfonamides

With the advent of streptomycin, the outlook in the treatment of the meningitides due to gramnegative organisms has become considerably brighter When treated with sulfonamides, recoveries from meningitides due to coliform organisms have been reported. However, treatment has been prolonged, and recrudescences as well as sequelae have occurred Ravid's explanation,6 that Esch. coli meningitis is more apt to develop in the newborn because of the low titer of antibodies for coliform organisms in that age group as compared to adults, suggests the use of blood transfusions in the treatment of these meningitides. Since the development of resistance of coliform organisms to streptomycin during treatment7 is a factor to be considered, both sulfonamides and blood transfusions as adjuvants in the therapy of Esch coli meningitis with streptomycin would seem to be desirable

The first case of successful treatment of Esch coli meningitis with streptomycin was recently re-

ported by Alexander 8

The patient was a 19-year-old soldier, who was wounded in action and subsequently developed osteomyelitis of the tibia, Esch coli bacteremia, and Esch coli meningitis He received 18,275,000 S units of streptomycin intramuscularly over a period of sixteen days, and 650,000 units of streptomycin intrathecally in 13 injections With the exception of a persistent pleocytosis, about 200 cells (90 per cent lymphocytes), attributed to the intrathecal therapy, no complications or ill effects due to streptomycin

The second case of Esch coli meningitis, successfully treated with streptomycin, was reported by Shields 2 The patient was a five weeks' old infant, from whose blood and spinal fluid a pure culture of Esch coli communior was obtained The dosage of streptomycin was 2,630,000 units intramuscularly, 30,000 units every three hours for ten days, and 300,-000 units intrathecally, 30,000 units into the basal cistern daily for ten days. The spinal fluid upon discharge revealed 154 cells, mostly lymphocytes. The infant recovered and had no apparent sequelae

While in the two cases, cited above, penicillin and sulfadiazine were also given, the authors in each case felt that the recovery was due to strep-

tomycin

The rarity of Esch coli meningitis treated with streptomycin, as well as the satisfactory outcome,

prompts the report of this case

BZ, a nine months' old girl infant, was delivered at term, weighing eight pounds and three ounces (3,714 Gm.) She was breast fed for a few days while in the hospital and was then placed on an evaporated milk-dextri-maltose formula Both development and growth were normal. She received three injections of pertussis vaccine at four months of age and was successfully vaccinated when seven months When four months old, she had an upper respiratory infection, from which she recuperated in four days

Prior to the onset of the present illness, she was apparently well until she awoke at 3 AM on November 7 with a cry She was very irritable and felt warm. She vomited one-quarter aspirin which the mother gave her and vomited again when a bottle of milk was given Irritability and vomiting persisted. The family physician was called on the afternoon of November 7

Physical examination revealed a nuchal rigidity which was equivocal. Temperature was 101 F Penicillin, 300,000 units in beeswax and oil, was administered intramuscularly, and sulfadiazine, five grains (0 3 Gm ) with an equal amount of sodium bicarbonate, was prescribed every four hours That evening the temperature rose to 1045 F On the morning of November 8, another injection of pencil-lin, 300,000 units in beeswax and oil, was given intra-Because of the persistence of nuchal rigidity, a spinal tap was performed and an opalescent fluid was obtained. At 4 P w on November 8, another dose of 300,000 units of penicillin in beeswax and oil was injected intramuscularly That afternoon the spinal fluid was reported as consisting of 760 cells with 90 per cent polymorphonuclear cells, the sugar content was 32 mg per cent, and gramnegative rods were noted on smear The infant was visited at home through the courtesy of the family physician and hospitalization was advised

Physical Examination—The patient was a wellnourished and well-developed nine months' old girl infant with a temperature of 101 8 F, pulse of 130, and respirations of 40 The color of the skin and body turgor were normal. She was somewhat restless and irritable but did not appear very ill. cry was lusty The anterior fontanelle was normal, bulging was not present The pupils were equal and reacted to light There was neither squint nor nystagmus The throat was slightly congested. The ears were normal. The abdomen was soft, the spleen and liver were not palpable. Tremors of the fingers and hands were noted. The knee jerks were hyperactive. The Brudzinski reflex was positive. The Kernig reflex was difficult to evaluate,

and, at best, was equivocal.

Laboratory Data — The spinal fluid taken in the hospital upon admission on November 8 was bloody The fluid taken on November 9, 10, 11, 12, and 20 was persistently blood tinged, crenated blood cells were present, and the supernatant fluid was vanthochromic. This made cell counts and spinal fluid chemistry unreliable However, gram-negative rods were found on smear of the fluid taken November 9 The organism was identified by culture as Esch. coli communior Subsequent spinal fluids were negative on smear and culture. Uring examined November 10, contained a faint trace of albumin and a faint trace of sugar with occasional granular casts and moderate epithelial cells, but was normal on subsequent examination. The blood count revealed hemoglobin, 11 6 Gm., which subsequently dropped to 9.2 Gm. and following transfusion rose to 18.3 Gm. white blood cells, 15 700 to 11,600, polymor phonuclear cells, 71 per cent, which subsequently dropped to 37 per cent, and monocytes which upon admission were only three per cent and, with improve-ment clinically rose to 21 per cent. Upon discharge the monocytes had dropped to two per cent. Blood culture taken November 8 revealed no organisms. On November 14 the blood sulfadiazine level was 0.8 mg per cent.

Clinical Course and Treatment -The fover rose to 104 F on the fourth hospital day, and on the fifth day was down to 100 F It remained normal for eight days, when it again rose to 102 F time an upper respirators infection was found. Ir ritability and restlesmess were marked for four days. and by the sixth day the child was standing up in her crib alert and active. Tremors of hands and fingers were noted the first four days. Vomiting and diar rhea were prominent symptoms. Food was refused and when taken, was frequently vomited watery stools were noted on the second hospital day The vomiting and diarrhea gradually subsided so that by the fifth day the child again took and retained her Rigidity of the neck and Brudzinski reflex were prominent for four days gradually subsided, and were absent by the seventh hospital day Kornig reflex was doubtful for the first four days. The knee jerks were hyperactive markedly so for five days, and were still active upon discharge from the hospital. The general appearance of the child was good at all times. Nother nystagmus convulsion, twitchings nor cyanosis was observed. A slight internal strabismus of the left eye was noted on the fourteenth hospital day (November 21) and was present on discharge. This disappeared subso-quently. The weight was 18 pounds 6 ounces (8,335 Gm.) when the cluld was admitted to the hospital and 18 pounds 2 ounces (8 222 Gm ) upon discharge from the hospital

Upon admission, 100 000 micrograms of streptomycln were given intramuscularly and 50,000 micrograms of streptomycin were injected intrathecally Thereafter 50,000 micrograms of the streptomycin were injected intramusoularly every three hours for nine days nine days Intrathecally, through the lumbar subarachnoid route 50 000 micrograms were given daily for four consecutive days. Sulfadiazino, which had been given prior to hospitalization was continued five grains (0.3 Gm.) with an equal amount of sodium blearbonate were prescribed every four hours from November 8 to 15 Because of the upper respiratory infection, fifteen grains (1 0 Gm.) as an in itial dose followed by five grains (0.3 Gm.) every four hours with an equal dose of sedium blearbonate was again given from November 20 to November 23 The infant also recieved subcutaneous clyses of 200 cc. of five per cent glucose in normal saline on No-vember 10 and November 11 On November 12, a vember 10 and November 11 On November 12, a transfusion of 200 cc of citrated whole blood was given because of the falling hemoglobin.

## Comment

Because of the finding of gram-negative rods in a stained smear of the spinal fluid, prior to hospitalization streptomycin was instituted immediately It is also probable that the infant had subarachnoid bleeding either as the result of a traumatic spinal tap or in the course of the meningitis, since subsequent spinal fluids were persistently bloody with the findings of fresh blood cells early and later eren ated cells and xanthochromic supernatant fluid Though this made evaluation of recovery by study of the spinal fluid sugar and cell count unreliable we were able to evaluate the condition of the child by the drop of temperature to normal, the marked clinical improvement and the absence of organisms in the stained smear and culture of the spinal fluid.

After each intratheral miection of streptomy cin. the infant seemed very irritable and had a rise in temperature. After the fourth intrathecal in jection the temperature rose to 104 F Because of the marked improvement the following day we decided to withhold intrathecal therapy for one day Since clinical improvement persisted, no further intrathocal streptomy in was given. The clinical recovery on the fifth hospital day is somewhat unusual in this type of meningitis. It could not be attributed to the sulfadiazine, since due to persistent vomiting the blood sulfadiazine level after seven days of therapy was only 0 8 mg per 100 cc. of blood. According to Barrett, Rammelkamp and Worcester 4 to 10 mg. of sulfathiasole per 100 cc of spinal fluid are desirable to obtain maximal effect against Esch. coli Rapid clearing of the spinal fluid from this organism, within four days, was also reported in the other two cases1 \$ which were treated with streptomycin. The total dosage of intrathecal streptomyon was 200 000 micrograms and intramuscularly 3 400 000 units were given Since blood culture was sterile the cause of the meningitis was unknown. This has been reported in 50 per cent of the cases.4 However most likely it was due to transitory Esch. coll bacteremia. At the present time the child is well and there are no apparent sequelac

### Summary

Escherichia coli maningitis of unknown etiology in a nine months' old infant was successfully treated with streptomy can

## House of Delegates

## Minutes of the Annual Meeting

May 5 to 7, 1947

[Continued from page 2030, October 1 188ue]

Sections 95-105 appear in this issue For subject index, see August 15 issue, page 17991

## Afternoon Session

May 6, 1947

The session convened at 2 15 o'clock, pursuant to recess

SPEAKER ANDRESEN The House will be in order Dr Coon will finish his report for the Reference Committee on Report of the Council, Part XI

Section 95 (See 28, 130)

Report of Reference Committee on Report of Council-Part XI Establishment of Organization Section in New York State Journal of Medicine

DR EUGENE H COON, Nassau This is a resolution that was referred to your Reference Committee from Bronx County

"WHEREAS, sound functioning of a democratic organization is dependent upon the informed electorate, and

"WHEREAS, as our New York State Medical Society, especially the House of Delegates, is such

a democratic organization, and "Whereas, the Council acts for the State Society between sessions of the House of Dele-

gates, and
"WHEREAS, it is the custom to publish the reports of the Officers, Council, and Standing Committees in April 1 and April 15 editions of the New YORK STATE JOURNAL OF MEDICINE Just preceding the annual meeting of the House of Delegates,

"WHEREAS, this custom allows insufficient time for study and deliberation by the representative county societies to enable them to instruct their

delegates, therefore, be it "Resolved, that the House of Delegates of the Medical Society of the State of New York direct the Publications Committee to establish an Organization Section in the New York State Journal of Medicine similar to that of the Journal of the American Medical Association, and be it further

"Resolved, that there shall be published in this section all minutes of Council meetings, progress reports of all standing and special committees, and any additional information which the Council

may direct, and be it further "Resolved, that the annual reports be published in the March 15 and April 1 issues of the New

YORK STATE JOURNAL OF MEDICINE"

Your Reference Committee is in sympathy with the spirit of this resolution These reports should be published and reach the membership early consultation with our Secretary, Dr Anderton, and the Editorial Board of the JOURNAL we find that the failure of chairmen to file reports before the deadline of March 1 causes the delay in publication

Mr Speaker, I move the adoption of this report Dr Harry Aranow (Councilor) I second the

DR FREDERICK WILLIAMS, Bronx You have taken no action at all on the resolution

Dr. Coon We are in sympathy with it entirely, but we don't see that there is anything we can do except to censure the Chairmen of the Council Committees

DR WILLIAMS The purpose of introducing this resolution was purely to stop the comment and adverse criticism of young men who are coming back as veterans and saying they will not join Organized Medicine and are not interested because they do not have a voice in it, which we know is not true. The reason they feel they do not have a voice in Organized Medicine is because they are not informed of our problems that come before the Houses of Delegates of both the Medical Society of the State of New York and the American Medical Association and the respective committees that make the decisions. They only hear the decisions later. We felt that if there was some directive introduced whereby these committees would see to it that their reports

got in early then the problems would be presented more to the members and we would not be confronted with this criticism of members saving they don t have a part or voice in the democratic functioning and proceeding of our organization was the purpose behind this resolution

The report of the Reference Committee to me seems to be a very innocuous and ineffectual recomdation and surely would not accomplish the aim and

goal which our resolution was intended for

Dr. Leo F Schiff, Clinton If I recall the reading of the resolution correctly, there were two parts to it one of which required the publication of an Or-ganization Section in which the minutes of the Council and other pertinent activities of the officers of the Bociety should be published from time to time, so that we might know before the time of the annual reports what was going on The second had to do with the publication of the reports as to the exact date of issue

Personally, I feel that some form of notification to the members of the most important activities of the Council and its important committees during the year would be of great benefit to us all rather than have us wait for the annual reports

I move you, Mr Speaker that this report be referred back to the committee as its recommendations in my mind are incomplete and do not cover the subiect entirely

The motion was seconded, and was put to a

vote, and was carried.

SPEAKER ANDRESEN It is referred back to the Reference Committee.

## Section 98 (See 32)

Report of Reference Committee on Report of Council-Part XI News Releases of American Medical Association

Dr. Eugene H Coon, Nassau On the second resolution from Bronx County reading

"Whereas the American Medical Association issues a release each Friday on the content of articles appearing in the forthcoming Journal of the American Medical Association and

Whereas these releases reach the public through the newspapers before the physicians have received their Journal containing the com

plete article and

WHEREAS, patients partially informed through these releases frequently ask their physicians

about such items, and

WHEREAS, these questions have been a source of embarrassment to the medical profession and have tended to affect adversely the confidence placed by the patient in the doctor's knowledge of current scientific advances therefore be it

"Resolved that such advance press items should be either discontinued altogether or released after actual receipt by the medical profession of the American Medical Association Journal and be it further

'Resolved that the delegates to the convention of the American Medical Association from the Medical Society of the State of New York be in structed to seek the passage of a similar resolu

Your Reference Committee agrees with this resolu-

tion and I so move

The motion was seconded, and as there was no discussion, it was put to a vote and was unant mously carried.

Section 97 (See 14)

Report of the Reference Committee on Report of Council-Part IX Legislation

DR ANDREW A. Eggston Westchester Your Reference Committee upon Legislation must in the first instance mention the very excellent work of the Legislative Committee We recall that, during the entire session of the Legislature many and detailed bulletins were sent to the various members of the County Legislative Committees acquainting them with what was transpiring in regard to medical legis lation during the past session. These bulletins were short concise and most instructive in regard to the attitude of the profession upon these issues many of which were of vital concern to the practice of medi cine in this State Therefore it is trite that a brief reference be made about the subjects considered Noteworthy is the fact that 5 200 bills were introduced in both Houses of the Legislature Of these, 157 separate bills were of interest to medicine.

A chiropractic bill of course came to life in the assembly and Senate but met the same rate as its

predecessors much to the good of the public. In regard to the question of vivisection it is well known that medical men are in sympathy with all humane animal experiments and are glad that such animal experiments be permitted under inspections and approval by the State Health Commissioner This should certainly satisfy those who do not under stand or sanction essential animal experiments.

Of special interest but entirely expected was the bill that Assemblyman Farbstein re-introduced, which was essentially a copy of the Murray Wagner Dingell Compulsory Health Insurance Bill. bill was not reported out of committee Th This was

good but we advise continual vigilance.

A 1 275-page Education Bill was passed and as there was little controversial matter which could be

judiciously amended the bill was approved.

Although fully aware of the fact that the Legisla tive Committee supported the Clancy Bill because it would declare the practice of reentgenology as the practice of medicine, your Reference Committee disagrees with the advisability of this support because it would allow both podiatrists and dentists to diagnose and treat by x ray and radium any part of Your Committee feels that the dentists the body should confine their use to their own field as contained in the Dental Practice Act and that podia trists should not be given such privileges tunately the Clancy Bill did not become a law

The educational law which would permit physicians to practice as partners also insurance companies to practice medicine on their behalf or for their insured by contract physicians, partners, or groups of physicians was disapproved not upon the grounds of group or partnership practice, but rightly upon the grounds of the establishment of Your Reference Committee corporate medicine approves of this action
The efforts of the Legislative Committee to define

and legalize specialties of roomganolgoy anesthesiology physiotherapy and pathology as the practice of medicine are to be commended.

Mr Speaker, I move this part of the report be

ndopted.

The motion was seconded and as there was no discussion, it was put to a vote and was unani-

mously carried DR. EGGSTON Much time and consideration, and statistical data in regard to a Basic Science Law was the subject of an exhaustive survey by your Medical Practice Committee

Your Reference Committee urges that all delegates read the entire report of that Committee

It is the opinion of your Reference Committee after much deliberation that a Basic Science Law has not been, and will not be, an effective deterrent to cult practice. To advocate a Basic Science Law is a serious step that may disrupt our present law, which gives us a unified Board of Medical Examiners

This conclusion is supported by the existence of numerous examining boards in many states which

have Basic Science Laws

Your Reference Committee recommends the approval of the recommendation of the Medical Practice Committee that the Medical Society of the State of New York should not sponsor a Basic Science Law

I move the adoption of this portion of the report DR WILLIAM B RAWLS, New York I second the

motion

DR CHARLES F GULLO, Laungston I ask that this part of the report be tabled until such time as the action of this committee in reference to the resolution from Livingston County on this subject is There has been a resolution introduced acted upon in line with this subject, in which we ask for an executive session to discuss it We want to know the report on that resolution first rather than duplicating the effort

Speaker Andresen A motion has been made to table this portion of the report until the report on the other resolution has been presented. Is there a

second to that motion to table?

DR FREDERICK B WETHERELL I second the motion

The motion to table was put to a vote, and was lost

DR GULLO What is the result of that? SPEAKER ANDRESEN Your motion was lost, and the decision on the report of the Reference Com-

mittee will have to be taken up immediately
DR GULLO May I take it up now then?
SPEAKER ANDRESEN Yes, but I would like to call your attention to the fact again that you have five minutes and can speak only once on any subject

DR Gullo Mr Speaker and Members of the House of Delegates, I don't like to talk five minutes, and would prefer to finish in less time, but I would like to ask you one favor. This is not my baby, it is our baby. I would like to ask you for the privilege of speaking more than five minutes on this subject if I have to, but certainly not more than ten

SPEAKER ANDRESEN Do you want me to put such a motion now or wait until your five minutes are up?

DR GULLO I would rather have it now SPEAKER ANDRESEN If someone will put such a

motion, I will entertain it

Dr. Wetherell I move he be given ten minutes DR JAMES R REULING (Trustee) I second it SPEAKER ANDRESEN The motion is to allow Dr ullo ten minutes All in favor say "Aye", con-Gullo ten minutes All in favor say "Aye", contrary, "No" It is about even Let us try it again All in favor of allowing the ten minutes say "Aye" all those against allowing the ten minutes say "No".

The Chair is uncertain We will ask you to stand

DR WETHERELL I ask for a standing vote SPEAKER ANDRESEN There has been a call for a standing vote All in favor of allowing him ten minutes will stand, now all those against it will stand. The "Ayes" have it, there are 97 in favor of allowing Dr Gullo ten minutes

You are allowed ten minutes, Dr Gullo DR WETHERELL Stick to the point, Gullo DR Gullo Thank you, gentlemen!

The answer of those of us who have advocated this particular subject for the past years is based upon two ideas of medicine, the only ones that make pos-sible the existence of Organized Medicine. It was said here not long ago by Dr Cuniffe and some years ago by Dr Gordon Heyd as president of the American Medical Association that Organized Medicine exists for only two reasons one, to disseminate knowledge to its members, two, to protect the public health Only because of those ideals have we striven to bring this about That is the only objective that we have had

Your Legislative Committee made this report, but two years ago when Dr Cottis made his recommendation he asked for certain factual data We beheve that certain factual data have been left out of

this report

We asked for an executive session in our resolution for this reason We have some very confidential in-Some of your officers know what it is, formation for I have told them about it I certainly cannot mention the name of this particular man who gave us this information, but this I will say to you without mentioning any names Dr Winslow and myself last year visited this particular gentleman, who is very high in the Legislature, as high as you can possibly think—well, not quite that high, but he is very near the top—and this is what he had to say He said, "You don't have to worry about the Vivisection Bill, we will take care of that," but we did our job just the same However, within two minutes he finished that off by saying, "How about the Chiropractic Bill? You know we have been holding this off for a long time. The State of New York is the dumping ground of cults, and it is time that their growth is arrested, and something will have to be done about it soon "

In effect, he meant briefly that we ought to look into the history of what has happened here from 1907 and throughout the nation In 1907 we passed the Medical Practice Act with the idea that it would take care of every body. The same thing happened in other states. The chiropractors and all cults in the State of New York have grown just the same We know we have not done anything with them other states where they passed a Medical Practice Act, the same thing happened, but then they turned around and they passed licensing acts for that particular cult. They were not able to control cult practice either with the combination of the Medical Practice Act and the licensing act, or either alone, any more than we did with just a Medical Practice Act The success of a law, of course, depends upon whether or not it accomplishes its objective In 1925 Wisconsin and, the same year, Connecticut—I think it was Connecticut—passed what is known as the first Basic Science Law Since then 17 other states plus the District of Columbia have enacted such a law

What happened in those states? Immediately the number of cultists licensed in those states dropped from there on In Minnesota, for example, it dropped—and these are the factual data that you do not have here-from 46 per year to 2 per year, in the State of Washington from 63 to 2, in Nebraska not a one has been licensed since the law was enacted, in the District of Columbia the same thing Now to get some data that were handed to us by our Executive Secretary, Dr Hannon, and sent to each one of the secretaries of our Societies He states in this report that in 1943 there were nine chiroprac tors able to pass the Basic Science Law in those When you compare that with 60, 43, 46, 64,

63 and 46, there are about 250 who would have been licensed in those states per year if the law had not been enacted To get near the conclusion 250 over a period from 1925 to today is 6 000. Approximately you can say that 3 000 of those people certainly came

to New York State

How sorious is this problem in the State of New lork really? Nobody knows The report here says that there is one chiropractor to every fourteen doctors. That is 2,000 Well, gentlemen I don t know where they got that dope from, but that is the exact figure that appeared in Medical Reconomics several years ago, and I wrote to those people and sald, "Where did you got that figure from?" and the answer was "Well the chropmetors gave us that figure." So nobody knows, but this we do know, that in the State of New York there are 6 000 com munities, municipalities which are incorporated and have a population of 25 000 or less Well, if you were to take the telephone directory for each of these municipalities, and to look up the classified directory you will find on an average at least one chiropractor in that community and that is 6,000 in the State of New York at least, and in doing that we are forgetting New York City or Buffalo or Rochester, or Syracuse

During this time that we have brought this up to you we have introduced this measure—not intro-duced but we have presented—we have presented our facts (and they are not our facts, they are sent to us) to the various county societies and ten of these societies have endorsed it These societies are Westchester Madison Livingston, Wyoming Steu ben, Niagara, Chemung Onondaga Broome, and Chautauqua counties If such men as Dr Cottis, and if such men as Dr William Johnson and if such men as Fred Wetherell and if such counties as Westchester and Onondaga say that this is just what we have been looking for, I cannot understand your

attitude.

And what have we been looking for? When you prosecute an individual in this State, you prosecute him for violating the Medical Practice Act, but you always get acquittals or the jury is hung Because invariably you fail to convince them that he violated the Medical Practice Act. By this the law is changed Our proposition does this It creates a Basic Science Low with a Basic Science Board which provides for examination in the basic science board winds a provides for examination in the basic sciences and gives a qualifying certificate The end result in the State of New York, if we had one now would be this You would have one licensing examining board You would have the Basic Science Board to issue a qualifying certificate, and as you legislate for something that exists you certainly don t legislate to make legal criminals, so you leave them out of the Basic Science Law You include the definition of the practice of healing, which is the heart of the Basic Scenee Law and you would prosecute him for practicing bealing, not medicine That is separate and distinct, and bealing is not now a part of the State of New York Medical Practice Act attempting to practice medicine is all you can now attempt to prosecute him for Consequently, you would have a separate basic science examining board and because it is difficult to get convictions the prosecuting attorney would have an opportunity to prosecute these people, who often bring about the death of those they attempt to heal, for practicing bealing without a qualifying certificate

In conclusion the Supreme Court of Minnesota in a test case—it was not a test case—concluded when a particular cult which was not licensed (it happened

to be naturopaths, we have chiropractors, but it was the same anomalous situation, the naturopath was being prosecuted for violating the law) was brought before it that the state has the power within its police power to regulate but not heense. That is what we are trying to do to establish in advance the protection to prevent the eventuality that happened in 1938 when the Medical Practice Act was amended in spite of our efforts.

SPEAKER ANDRESEN Is there any further discussion?

DR. GULLO The reports I got were from the Secretary—may I speak one minute more? Chorus You spoke ten minutes already

DR. WETHERELL Get down DR. WHALAM B RAWLS, New York Mr Speaker and Members of the House of Delegates, as a member of this Reference Committee I would like to say that your Reference Committee considered all of the facts that have been presented by Dr Gullo think we spent something like six hours on them We have been in detail over all of these reports. have considered the facts that he advanced, that perhaps if you had one examining board you might climinate cults. After a thorough study we could find no evidence that the passage of the Basic Science Law would eliminate cults We find evidence that, where there was more than one examming board they might accomplish something, but as far as it applies to Now York, where at the present time we have one unified Board of Medical Examiners, that to interfere with the present Medical Practice Act might open it up to what we might not like After the politicians get through with it, no one knows what would be left. We felt on that basis that we should not interfere with the Medical Practice Act, that it would be a dangerous procedure, that we had no proof it had accomplished any thing before and we felt one unified Board of Medical Examiners is about the best protection we could have

Furthermore, if we have a group of young people taking this examination in the basic medical sciences we will have a greater number who will want to enter into some form of the practice of medicine As you know all of our medical schools are now crowded, so there would not be room for them in the medical schools, and we believe we would have more taking to the practice of cultism than we have at the present moment

SPEAKER ANDRESEN Is there any further discussion? If there is no further discussion all in

favor-DR. GULLO May I make a motion to the fact that this report of the Legislative Committee be sent back to the Council for final decision?

DR. WETHERELL I will second that I would like to talk to that motion, Mr Speaker if I may

SPEAKER ANDRESEN Yes.
DR. WETHERBILL Mr Speaker and Gentlemen, I have not talked on this before, but I have definite ideas on the subject, as you may have gathered from what Dr Gullo said It seems to me that it is un fortunate that the opponents of the Basic Science measure in New York State so often take their opponents arguments as a reflection on their personal ability and loveliness. There is nothing personal in this but it has come to me in a great many ways and I have nearly lost friends because of the study we have made.

I looked through the report of the Legalative Committee in the JOURNAL and found this That we are morally obligated to protect the health interests of the people of the State of New York At last that is in writing Is it or is it not, then, one of our moral obligations to see to it that in some way, although it takes fighting year after year after year to keep down the cultists who are entirely unprepared to touch a sick human being, that we eliminate all

In the supplementary report, which is to me a rather scanty one although I know a great deal of work was done on it, the fact is brought out that such a law has been enacted in Kansas and in other states Of course, we are to assume that New York State is not able to instigate proper legislation for the control of cults That is what we are in effect assuming when we take the negative action we are taking today is possible for the Kansas Board of Medical Examiners to go into court and obtain injunctions against unlicensed practitioners of the healing art, and they do it The same is true in Minnesota, although that is just barely scanned over in this re-

Two other factors appear to be of considerable value in keeping down cult practitioners these is the use of the injunction whereby it becomes necessary only to demonstrate to a judge the illegal nature of a defendant's practice in order to restrain him effectively from such practice rather than having to submit the case to a jury. The other procedure which appears to help the situation is the investiture of the State Board of Medical Examiners (as is done in Minnesota) either with actual or with unstated but generally accepted legal powers to investigate and prosecute violators of the medical practice New York State does not have a regulations separate Basic Science Law, and despite all of the arguments against it Dr Adson, who was very much interested in medicine and medical practice in Minnesota, told me they can pick them up, and do pick them up, and no new ones are coming into Minnesota because it is just the same as if you are driving a car without a license, the police officials do not have to prove anything, they simply assert you have not your license

If this report goes through, I would like to have someone who is much better versed in the formation of resolutions than I am to present a resolution that the matter of injunction and further investiture of our State Board of Medical Examiners be such that they can prosecute, or are we just going to sit down and year after year spend the State Society's money to keep the chiropractors from being licensed? Well, they are going to be licensed, and I have been told it by several legislators, including some of the very top executives

DR HARRY ARANOW (Councilor) I think we cannot help but admire the sincerity and perserverance of Dr Gullo, but after all this is a democratic country, and we are ruled by the majority thing has come up again and again and again, and it is up to the majority of the men present to decide We have had hearings before this House had these gentlemen appear before the Council We have had them appear before committees Last year they appeared before a committee of which I We have sent out for information was chairman and have made inquiries all over the country, and after all of our study we are not convinced that the Basic Science Law will do anything at all to prevent As long as there is a practice of medicine which requires a great deal of study and preparation, there are going to be quacks. There have been quacks in the history of medicine from the very beginning, and they are always going to be there

There is aways going to be somebody who is going to try to practice some art of healing, and if you' don't get it from the chiropractors it will be from

another group

This committee, with all due respect to the other gentlemen, feels that the Basic Science Law is not going to do a thing Besides that, the Basic Science Law does not make the thing final Next year they can bring in another amendment and change it There is no law in this country that prevents a man from bringing in a bill to change that which has been passed the year before They can change it again, From the studies we have and again, and again made we have come to the conclusion that a Basic Science Law will not do anything at all to prevent chiropractors from going ahead the way they have been doing

DR GULLO But—

SPEAKER ANDRESEN We cannot allow you to speak again

DR GULLO May I ask for thirty seconds more?

SPEAKER ANDRESEN For what?

DR GULLO Just to show something from which you can see for yourselves its efficacy

Speaker Andresen I am sorry, but we will have to take a vote of the House before you can do that You will have to ask the consent of the House before you may speak again on this subject

DR EZRA A WOLFF, Queens Give him the unanimous consent of the House to do that

CHORUS Yes

DR GULLO Thirty seconds will be too long statement was made that the Basic Science Law does not work The test is Does it prevent the licensure of cults in the states that have the law, and can you get prosecutions and convictions? The State of Minnesota in its letter from the Executive Secretary, and I am willing to turn it in as evidence, says that after investigating 800 cases 250 were prosecuted and they got 90 per cent convictions

(Chart) Here is what happened in Minnesota By 1977, there won't be any By 1953 there won't be

anv

(Chart) In Nebraska, that is the graph, gentlemen, and anybody who wants to look at the data right here from the executive secretaries of all of these

The two charts have been handed in separately ) DR REGINALD A HIGGONS, Westchester men, I want to say just a very few words I have gone into the information that Dr Gullo has presented to you scantily, and I am just as convinced that there is truth in it as Dr Aranow is that there is We both look at it with honesty of purpose, but we look at it with a different result

I live in Connecticut, just over the Connecticut line, in a town which is rated as being one of the wealthiest in the United States, so would be a golden field of endeavor for chiropractors adjoining town just across the line, where the populations are equal, there are probably ten chiropractors
In this town of Connecticut that I refer to, I know
of none—not one That is just one of the facts that
I happen to know because I live there

What I think ought to be done with this thing is another attempt should be made in honesty to determine whether or not the best way out for us is a Basic Science Law What we have done in the past Basic Science Law What we have done in the past has completely failed What they say they are going to do in the future is very likely to continue to fall because what we do is nothing It is all right to say, "Enforce your Medical Practice Act," but I defy any of you to tell us how to do it It can't be

done. It never has been done and it never will be done

DR. FELIX OTTAVIANO, Madison If our delegated visitor from the State of Connecticut is here could we ask that he express his opinion on this as it applies in Connecticut?

SPEAKER ANDRESEN Dr Howard, will you

oblige? DR. JOSEPH H HOWARD Mr Speaker and Mem bers of the House, I am sorry that I have not any figures with me to tell you how many of these cultists are licensed in Connecticut. I can assure you it has been cut down considerably under the Basic Science Chiropractors occasionally pass the Basic

Science Board, so it does not climinate them en tirely but it has very definitely cut them down to a I am sorry I cannot supply you with minimum

authentic figures

Dr. Ottaviano Mr Speaker I am a member of the Reference Committee which is giving this report and went along with the report purely because we knew that if it came up in executive session it would probably be squelched, but I should like to have my say now We have heard from the visitor from Con-necticut Dr Aranow states, as do many others who are older in this Society than I am that for the past so many years we have heard it, and he insists on the workings of the democratic process. I also insist that that process work. It can only work if we give each man his day in court. I wanted to limit discussion even to a certain limit of time but that did not seem to be appropriate

The statement was made that it does not work in We have just been told that appar ently it does Therefore gentlemen whether you are for or against it you must at least be willing to

laten to the facts

BPEAKER ANDRESSEN Is there any further dis-cussion? If not, we will put it to a vote All those in favor of the recommendation of the Reference Committee which is against the Basic Science Law-

Dr. Gollo No there was my motion to refer which takes precedence that the report be sent back

to the Council

SPEAKER ANDRESEN But the Council has been orking on it for years The motion then is to refer

working on it for years the report back to the Council-

DR WETHERELL The motion is that the report be referred back to the Council, the report of the Legislative Committee on the Medical Practice Act I would like to say that if this is voted the Council will have the opportunity to put on the investigating committee one or two members who are for a Basic Science Law and not all members who are against it (Applause)

DR. ARANOW I am sorry to get up again but this thing was referred to the Council last year— SPEAKER ANDRESEN I can only give you half a minute You have discussed this before

Dr. Aranow It was referred to my committee, the committee of which I was chairman neither for nor against it. As you know I have been fighting for the benefit of the medical profession for years. If I thought for a minute that the Basic Science Law would help us I would be for it

Dr. D DEXTER DAVIS Gentlemen you have heard from the State of Connecticut, and I would like to tell you about the State of Vermont. To pass a Basic Science Law in the State of Vermont there was one group that was willing to go along with the medical profession, and that was the ostcopaths.

The chiropractors were entirely unwilling. When it came down to discussing this question—and you

will find the same thing happened in our State Legislature-when it comes to passing a law such as you are trying to pass or talking about passing you are going to have the chiropractors come to the legislature against it. That is why they did not pass it in the State of Vermont this year because the chiropractors said that this would legislate out of existence every chiropractor in the State

The motion to refer back to the Council was put by viva voce vote and as there was uncertainty

as to the outcome it was put to a standing vote
SPEAKER ANDRESEN You are now voting on the motion to refer the report back to the Council. The vote is so close to a tie, and there are so many chances of error that we will put it to a standing vote I will ask Dr Wetherell to act as one of the tellers

The motion was put to a standing vote

SPEAKER ANDRESEN The motion to refer is lost. Now we come back again to the report of the Reference Committee

Dr. Samuel Z Freedman, New York We have heard representatives from Vermont and Connecti We have a representative here from Pennsylvania, where they also have a situation which might be of interest to us, and I suggest that you call upon

CHORUS No.

Dr. Aranow We have written to every state in the union for information. It takes more than one

swallow to make a summer

The motion on the adoption of the report of the Reference Committee which was contrary to the Basic Science Law was put to a viva voce vote, and as there was uncertainty as to the outcome, it was put to a standing vote and was carried
SPEAKER ANDRESEN The recommendation of the

Reference Committee which carried with it disapproval of the Basic Science Law was carried by a

vote of 94 in favor to 63 against

DR. Eggston Please do not hand me any more hot potatoes . The work on that committee was very difficult, but I think a thing that calls out as much discussion as this has had really shows a great interest in furthering what we all want to do Any thing that brings out that much interest shows that we are all very much concerned about the practice of medicine in this State, and I think it is very healthy However, that is beside the point

Your Reference Committee wishes to voice its appreciation of the tremendous amount of work done by both the Legislative and the Medical Practice Committees

I move the adoption of the report as a whole The motion was seconded and as there was no discussion it was put to a vote and was unani

mously carried

Section 98 (See 33)

Report of Reference Committee on Report of Coun cil-Part IX. License of X Ray Departments as Laboratories

DR ANDREW A EGGSTON Westchester I have a bunch of resolutions that were handed to my com-

This resolution concerning the heense of x ray departments as laboratories of hospitals was introduced by Dr Nelson W Strohm of Eric County

WHEREAS, there has been enacted a law which ermits hospitals to license x ray departments as laboratories and

"WHEREAS, this law is in conflict and circumvents Chapter 466 of the Education Law of 1944 and Chapter 307 of the Workmen's Compensation Law of 1941 relative to the division of fees. und

"Whereas, this permissive law does not serve the best interests of the citizens of the State,

especially the ill, be it

"Resolved, that the Counsel of the Medical
Society of the State of New York proceed legally to test the validity of this Act or Law"

Your Reference Committee agrees in principle with the resolution However, because of the many factors involved in preparing a legal testing of the validity of the law, which requires further study, your Reference Committee therefore recommends that this resolution be referred to the Council

One of the things that it entails is the expenditure of moneys I don't think we are qualified to give you

a definite opinion on that

I move the adoption of this report

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

Section 99 (See 90)

Report of Reference Committee on Report of Council-Part IX Status of Employment of Radiologists by Hospitals on Salary

DR ANDREW A EGGSTON, Westchester This is a resolution introduced by Dr Porter A. Steele, of Eric County, concerning the status of employment of radiologists by hospitals on salary

"Whereas, the 1947 State Legislature enacted on amendment to Section 13-c(2) of the Workmen's Compensation Law which permits hospitals to employ radiologists on a salary basis, and

"Whereas, this new law is inconsistent and is in conflict with Section 1261-4 of the Education Law and Section 13-d (2g) of the Workmen's Compensation Law, which prevent hospitals from employing radiologists on a salary basis, and "Whereas, these statutes will result in a great

deal of confusion in the minds of radiologists as to whether they may accept a salary, therefore, be

"Resolved, that the counsel of the Medical Society of the State of New York take legal steps to secure an interpretation of the statutes relating to the permissible financial relationship between hospitals and radiologists'

Whereas this resolution and the previous one just acted upon are closely related, your Reference Committee recommends the same action as upon the previous one, namely, that it be referred to the Council of the Medical Society of the State of New

York I so move The motion was seconded, and as there was no discussion, it was put to a vote, and was unani-

mously carried

Section 100 (Sec 84)

Report of Reference Committee on Report of Council-Part IX Head of Federal Health Department to Be a Physician

DR ANDREW A EGGSTON, Westchester We have another resolution introduced by Dr Leo F Schiff, of Chinton, which has as its subject, "Head of Federal Health Department to Be a Physician"

"Whereas, there have been introduced into the Congress of the United States bills having for

their objective consolidation of all Federal Health Activities under one head, and there is likelihood that other bills for the same purpose will be introduced, and

"WHEREAS, the methods proposed for effecting the consolidation of these activities vary in the various bills, particularly as to the administrative setup whereby in some instances the health activities are only a subordinate part of some other

department, be it "Resolved, that the Medical Society of the State of New York believes it to be to the best interests of the people of this country that all federal activities having to do with the public health be consolidated under one head and that such consolidated body be set up as an independent body under the administrative direction of a physician and not be consolidated as part of a department having other functions in addition to the public health

Your Reference Committee recommends the approval of this resolution

DR WILLIAM B RAWLS, New York I second the motion

SPEAKER ANDRESEN Is there any discussion?

PRESIDENT BAUER Mr Speaker, point of information I understand the Planning Committee's report contained material on this same subject Can the Chairman of the Reference Committee tell us how that ties in with the report already adopted by the House?

DR EGGSTON I was so busy with this other matter that I did not hear the report of that Committee

nor am I familiar with it

DR LEOF SCHIFF, Clinton May I answer that? SPEAKER ANDRESEN Yes, please do

DR SCHIFF Answering Dr Bauer, this is entirely in accord with the report of the Reference Committee that Dr Bauer speaks of At that time it was simply to emphasize something which had been adopted by adopting the report generally that this was introduced

PRESIDENT BAUER I do not have any objection to the motion of the Chairman I just wanted to be sure we were not adopting two different procedures on the same subject As long as this is in accord I am glad to second the motion

DR O W H MITCHELL (Councilor) I think the wording of that resolution should be that the head of such department should be a doctor of medicine As it is now it just says "a physician"

DR SCHIFF I will accept that SPEAKER ANDRESEN That amendment has been accepted by the proposer How about the Reference Committee?

DR EGGSTON We will accept that

The question was called, and the motion was put to a vote, and was unanimously carried

Section 101 (See 80)

Report of Reference Committee on Report of Council-Part IX X-Ray Diagnosis

Dr. Andrew A Eggston, Westchester diagnosis is the subject of the resolution introduced by Dr Aaron Kottler, of Kings County

"WHEREAS, a bill to amend Section 1250 of the Education Law of the State of New York in relation to practice x-ray diagnosis and treatment, and treatment by radium was introduced in the 1947 legislature, which bill was not passed, therefore be it

'Resolved, that the Medical Society of the State of New York request that a bill be introduced in the New York State Locislature in 1948 as follows

X my diagnosis means that method of medical practice in which demonstration and examina tion of the normal and abnormal structures parts or function of the human body are made by use of x rays, and any person who holds himself out to diagnose or able to make or makes any interpretation or explanation by word of mouth, writing, or otherwise, by the meaning of a fluoroscopie or registered shadow or shadows of any part of the human body made by the use of x-rays and also the use of x rays or radium for the treatment of any human ailment, shall be deemed to be engaged in the practice of medicine within the meaning of this article, and Section 1202, as follows The provision of this article shall be deemed to prohibit the practice of x ray diagnosis, x ray therapy, or radium therapy, as defined in subdivision ? A of Section 1250 of this chapter by any person other than a person licensed as a physician a dentist, an osteopath or a podiatrist. Be it further

Resolved, that the Medical Society of the State of New York actively work for the passage of such a bill in the Legislature during the year of

1948.

Your Reference Committee recommends the approval of this resolution with the deletion of the following words a 'dentist, an osteopath, or a podiatrist ' Your Committee further recommends that in the cases of dentuts and esteopaths this resolution may only apply in so far as their respective practice acts specify I move the adoption of the

Da. William B Rawls, New 1 ork I second it As this resolution was worded it would appear that the House of Delegates would be going on record as trying to sponsor a law to favor the practice of x my by the podiatrists and the esteopaths We are in favor of the basic principle of the resolution but we desire to eliminate the words osteopath and podi atrist' and so qualify it according to what the Medical Practice Act states it may be It was because of that that we made the change in wording in the resolution. We felt that the Medical Society did not want to be actively engaged in the support of a law to put across the practice of osteopathy or

podiatry
Da. HARRY ARANOW (Councilor)
Da. HARRY ARANOW (Councilor) The ordinary lay person is not in a position to draw up a bill. You an only give the continent that the bill when drawn up about a present and the continent that the bill when drawn up about express. There is a regular organization in Albany that draws up bills. If you give me a definite rule as recommended in the first clause the definite rule as recommended in the mile have to go bill may not even be legal. It will have to go through a drafting organization. It is all right as have tred to get that for years Therefore I don't know that it is a good idea to tell the Logislative Committee to get a !lil passed as stated because it may not be a good bill at all. It has to be drafted by We are in sympathy with it, and have experta tried to do it for years.

As far as the Clancy Bill is concerned, we have tried to put in a bill for a number of years in Albany that would make the interpretation of x rays the practice of medicine. Years ago there was a de-cision of the Supreme Court that the interpretation of an x ray film was not the practice of medicine The Clancy Bill came in at the end of the session and we were afraid that if we tried to do any cliang ing in it, it would not go across at all, and we were anxious to get it across. It is my experience that rather than take nothing it is better to take that which you can at the moment, and try for more later on, so we were willing to support the Clancy Bill in spite of the fact that its wording was not very good

DR JAMES R. REULING (Treasurer) In the reference committee report, they again use the word It should be changed to doctor of physician. medicine' Are they willing to change it or will I

make a motion to that effect?

DR. EGGSTON 1 cs, we are willing to make that

DR JOSEPH A GEIS, Essex. It seems to me that in the wording of this resolution we are asking Dr Aranow to do the absolutely impossible He has been mixed up with this stuff long enough to know what we want I know some of the work he has done in the past ten or fifteen years in connection with this and I cannot see any reason for passing this resolu-tion because it may not be possible for him to do it the way it is worded

DR. AARON KOTTLER Kings The wording of that resolution is identical with the bill that was introduced last year It has already gone through

this drafting committee

Dr. Ananow We approved of that bill last year DR. KOTTLER I don't know if we did but I do know this is an exact copy of the bill that was in committee in the State Legislature and never came out of committee

Dn. GEIS That s the point I am making It has been in the State Legislature for three or four years, and if it gets out of committee in one house it dies in committee in the other. As it is worded now I doubt if it can be brought out of committee onto the

floor of either house

Dr. Korrler I have no objection if this delega tion would approve this recommendation in principle, and the proper wording of it to be delegated to a proper body who would see that this resolution is

correctly framed into a bill.

DR HOMER J KNICKERBOCKER, Onlaria cannot direct our Legislative Committee to adhere to any specific draft of any bill which we might wish to have introduced. We can refer the matter to them with the request that they embody the prin-ciples involved in a proposed bill to be introduced and I so move you.

SPEAKER ANDRESEN Do you want to have it referred back to the Reference Committee to do it?

DR. KNICKERBOCKER No we cannot definitely limit the wording of any bill which we would like to have introduced at a meeting of this character, no matter how carefully the resolution is made There are legal and legislative reasons why it could not bass if it was put through. I believe Dr Aranow's Committee is in a position to give us the best advice along those lines. They are capable, with the assistance of other committees in the Society of drafting some bill which will have a chance to pass I think we could definitely refer this matter to the Logislative Committee with a request to produce such a bill.

DR. RAWLS I would like to substitute if it is in order, that the House of Delegates approve this in principle to refer it to the Council for proper word

DR. KOTTLER I second that.

There being no discussion the question was put on the substitute motion and it was carried.

SPEAKER ANDRESEN Now we come to the substitute motion Is there any discussion?

There being no discussion, the motion was put, and was carried

SPEAKER ANDRESEN Thank you very much, Dr

Eggston!

Dr Eggston wishes me to announce he is going to have a meeting of his committee immediately, across the hall

Section 102 (See 8, 47, 38, 104)

Report of Reference Committee on Malpractice Insurance and Defense Board

On Motion by President Bauer, seconded by Dr Frederick S Wetherell, Onondaga, the House went into Executive Session, and took up the Report of the Reference Committee on Malpractice Insurance and Defense Board

Section 103

Report of Reference Committee on Report of Legal Counsel

The House also considered the Report of the Reference Committee on Report of Legal Counsel

Section 104 (See 47)

Report of Reference Committee on Report of Malpractice Insurance and Defense Board Resolution on Appointment of Committee

DR A. W MARTIN MARINO, Kings Your Reference Committee recommends that the following resolution be substituted for the resolution offered by Dr Bauer

"Whereas, the House of Delegates in 1944 directed the appointment of a committee to make a survey of the entire malpractice insurance and defense situation in the State, and

"WHEREAS, the committee was duly appointed, and reported to this House at the regular meeting

in 1945, and

"WHEREAS, after due notice the Constitution and Bylaws were amended to create a malpractice insurance and defense board, and

"Whereas, this board was created by the House of Delegates at the regular meeting in

1946, and
"WHEREAS, the insurance board is a duly authorized agent of this House of Delegates, and "Whereas, the insurance board has functioned

during the past year, and

"WHEREAS, the House of Delegates at the regular meeting in 1946 authorized that an audit be made of the malpractice insurance program, and a report based upon the result of the audit has been submitted to this House, and "Whereas, the value of such audit can be con-

tinued and made increasingly useful, therefore be

"Resolved, that the Malpractice Insurance and Defense Board be charged to continue the survey of the malpractice insurance situation, and be it

"Resolved, that the said Malpractice Insurance Board shall be required to apprise this House from time to time of changes in the situation and to make recommendations for the purpose of increasingly implementing and inproving malpractice defense, and be it further

"Resolved, that upon direction by this House or the Council our audit be made by an insurance actuary or actuaries"

The Report was accepted and the Resolution adopted

We are now in regular SPEAKER ANDRESEN session

Section 105 (See 17)

Report of Reference Committee on Reports of President

DR PHILLIP D ALLEN, New York Your Reference Committee sympathizes with the expressions of the President regarding the deaths of Doctors Hale,

Dwight, Flynn, and Sullivan

We agree with his suggestion that plans should be promulgated to the end that the work of our officers should be made less burdensome Your Reference Committee recommends that plans be made to accomplish this by subdividing the tasks of, or by increasing the number of, elective officers Your President has in his supplementary report discussed this situation as it relates to your Board of Trustees and has presented amendments to the Constitution to effect these changes With this your Committee heartily concurs

Your Reference Committee specifically calls attention to that part of the President's report wherein he urges the House of Delegates to give serious attention to the matter of increasing the

The remainder of the report consists of a survey of the various activities of our Society and requires no recommendations

In his supplementary report our President discusses the merits of two bills now in Congress, having for their objective the centralization of all health activities of the Federal Government Your Reference Committee feels that it is not its function to make any recommendations in reference to this legislation, as it is being considered by another Reference Committee

The President bids us to be forward-looking in our program and not to wait for things to happen We particularly stress his statements that "Whatever is best for the public must be our aim," and "Our action must be both progressive and aggressive "

We heartily concur with his appeal to arouse the interest of individual physicians and to revitalize our county societies, and his statement that it is of utmost importance for each individual to take it upon himself to make his county society a vital force

In conclusion, your Reference Committee feels deeply impressed by the wholehearted and efficient manner in which our President has responded to the increased responsibilities which were so suddenly forced upon him We feel certain that his assurance that he will do his best to carry out the duties placed on his shoulders and will prove himself worthy of our confidence is no idle promise

I move the acceptance of this report

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

He was a mem ber of the Kings County and New York State medical scoletics and the American Medical Association.

### ANNOUNCEMENT

Participating physicians are urged to send in treatment authorization Form NY10-104 promptly on completion of treatment as authorized, in order to expedite payment for services rendered. It is not necessary nor desirable to wait until the first of the month to submit such reports. Presentation of this form within thirty days will be appreciated

If for any reason authorized services have not been given, or will not be given physicians are requested to return authorization form promptly for cancella-tion so that funds encumbered may be used for other authorization. For any services completed prior to July 1 1947 authorization forms should be submitted without further delay

Participating physicians are again requested to make complete reports on patient s condition and response to treatment. If the space on Form NY10-104 does not seem sufficient additional data may be presented on physician s own letterhead in duplicate

> GEO HUNTER O KANE, M.D. Coordinator Veterans Medical Service Plan of New York Inc.

## ABSTRACT OF MINUTES OF THE COUNCIL OF THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

T ITS meeting on September 11, 1947, the Council considered various matters, taking final action or directing further study and reports, as indicated under the following headings

## Secretary's Report

Remission of State Assessments —The remission of State assessments was voted on account of service with the armed forces for 20 members for 1947, and 75 for 1946, also on account of illness for Drs Anna M Ralston, Paul E Wesenberg, and F Ward Renfrew The refunding of dues of one member was authorized

Meetings —At the request of Dr T P Murdock. chairman of the Committee on Nursing of the House of Delegates of the American Medical Association, your Secretary took the liberty of placing a room at

his disposal for a meeting on September 3

On July 28 to 30, the 43rd Annual State Health Conference of the New York State Department of Health was attended at Saratoga Springs by Drs Bauer, Winslow, Mitchell, Hannon, Anderton, and Messrs Walsh and Cook of the Public Relations Bureau One of the best features of the program was an address by President Louis H. Bauer

During his holiday, your Secretary visited the towns of Honeoye, Dexter, and Parishville in order to help these communities obtain a local physician

Directory -The Publication Committee will report about distribution of the 1947 Medical Directory of New York, New Jersey and Connecticut, which is almost completed As this is our first directory in five years, quite a few mistakes have occurred. A few have been due to clerical errors However, most of the incorrect listings have occurred because proper information was received after the deadline for going to press, October 1, 1946 The report was accepted

Communications.—1 Letter dated August 15, 1947, from John W Brownlee, executive secretary, Vermont State Medical Society, requesting the name of the delegate (or delegates) to the annual meeting of the Vermont State Medical Society,

on October 1, 2, and 3

It was voted that one or two delegates be sent 2 Letter dated May 13, 1947, from Dr E S Platt, Auburn, in regard to not holding reservation at Hotel Buffalo at the time of the 1947 Annual Meeting, was brought to the attention of the Council

Letter dated July 9, 1947, from Dr R L

Yeager, secretary, the Medical Society of the County of Rockland, was read by the Secretary
"The following resolution was adopted by the Rockland County Medical Society at its June meeting, held June 25, 1947 A copy of this resolution was sent to the secretaries of Orange, Putnam, Dutchess, and Sullivan counties for endorsement with a request that they take action upon a similar resolution

"Resolved, Many problems arise in the component county societies of the Medical Society of the State of New York The work of each county society is increasing tremendously. Close contact of various societies with the State Society is becoming increasingly necessary in order to produce concerted action on many problems appears that through development of the dis-

trict branches an opportunity is offered for closer amalgamation of effort on the part of contiguous counties which have common political and public relations problems

"Therefore, the Medical Society of the County of Rockland requests the Council of the Medical Society of the State of New York to undertake a study of the present makeup of the district branches to the end that a redistribution of counties within each district branch be made and other steps taken whereby the district branches may become organizational units to strengthen

the unification and solidification of the State Society"

It was voted that this be referred to the Planning Committee

Letters dated June 12 and September 2, 1947, from Dr Charles Gordon Heyd, president, Physicians' Home, in regard to the nomination of directors for Physicians' Home, were presented by the Secretary, and

It was voted to nominate the following David M Freudenthal, Dr B A Goodman, Mrs Edmund A Griffin, Dr David J Kaliski, Dr Luther MacKenzie, Dr Ada Chree Reid, Dr Shepard Krech, Dr Beekman J Delatour, Dr Irving Wright, Dr Donald B Armstrong, Dr Cornelius Rhodes, Dr L F Rainsford (Rye), Dr Thomas M Brennan (Brocklyn) Dr Fordwea B St John. M Brennan (Brooklyn), Dr Fordyce B St John, Dr A W M Marino (Brooklyn), Dr. Harry Imboden, Dr Dever Byard, Dr F W Holcomb (Kingston), Dr E C Jessup (Roslyn), Dr Tasker Howard (Brooklyn) (Residences are New York City, unless otherwise noted )

A letter from Dr A. Carl Hofmann, treasurer of the Onondaga County Medical Society, was received, requesting advice concerning dues for new applicants during the remainder of the year, since, according to the State Constitution, dues and assessments of a member elected or reinstated after October 1 shall be credited to the succeeding year

The Council voted that the interpretation of the above would be that the assessment for each member elected after October 1, would be \$15, the House of Delegates having prescribed this as the State Society assessment for the year 1948

Treasurer's Report was Accepted

## Report of Executive Officer

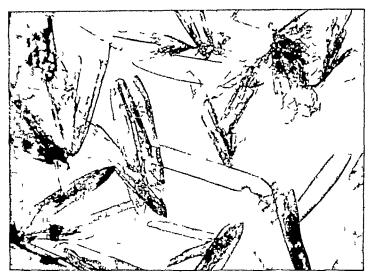

Dr Robert Hannon reported that since the last meeting of the Council he had attended various meetings of the State Health Department and county societies and committee meetings of the Society, that at the present time all arrangements for all District Branch meetings had been completed, that a few programs had already been printed, and sent to the New York office for distribution

## Activities of Committees

Subcommittee on Cult Practice —Dr Maurice J

Dattelbaum, chairman, reported progress
Constitution and Bylaws.—The Council voted to approve the changes requested by the Medical Society of the County of Ontario in their bylaws relating to membership

[Continued from page 2220]

Committee on Economics —The following report of the Director of the Bureau of Medical Care was submitted

June 22, 1947 Mr George P Farrell interviewed the directors of all six medical care plans in New York State regarding development of a special folder to be used for the promotion of medical care insurance by each plan in its respective area plans have indicated their willingness to cooperate

The folder will consist of four pages, the front page to include the name and address of each local plan, and the text for the two inside pages to be furnished by each plan, describing benefits offered and such other information as the plans may wish to The back page will contain facts on the progress of all plans throughout the State for the six months ending June 30, 1947, and will be compiled by the Bureau Each plan will bear the cost of the folders used Pamphlets will be distributed to all doctors throughout the State to acquaint them further with the progress of nonprofit voluntary insurance plans in the State

July 17, 1947 Mr Farrell spoke before the Vermont State Health Council at Montpelier on

"The Importance of Medical Care Plans in a State Health Program"

July 30, 1947: The Director contacted Dr Luther Thomas, president of the Steuben County Medical Society, concerning action which had been taken by that Society in connection with affiliation in the Central New York Plan, Syracuse The Steuben County Medical Society is the only Society in the plan's operating area which has not taken official action Dr Thomas referred Mr Farrell to Dr Richard O'Brien, chairman of the Legislative Committee, and he advised that he would bring the matter to the attention of the Society at the earliest

August 6, 1947 Mr Farrell received a letter from Mr Frank Smith, director of Associated Medical Care Plans, stating that the Executive Committee of AMCP had appointed Mr Farrell a member of its new Committee on Research Studies Mr Jay Ketchum, executive director of Michigan Medical Service, is chairman of the new committee, and Dr Frank G Dickinson, director of the Bureau of Medical Economic Research of the AMA, will assist the committee in an advisory capacity

Mr Farrell has written Dr A H Aaron, chairman of the Subcommittee on Medical Expense Insurance, regarding acceptance of this appointment. and Dr Aaron personally feels very strongly in favor of acceptance and recommends its approval by the proper officials of the State Society On the advice of Dr Aaron and Dr Anderton, Mr Farrell attended the first meeting of this Committee in Chicago, on

September 4 and 5, 1947

It was voted that acceptance of this appointment be

approved
Mr Farrell made a progress report on the New
York State Medical Care Plans for the six months ending June 30, 1947, as follows Membership as of June 30, 1947, was 860,703, which represents an increase during the first six months of 260,070 This increase exceeded the same period of 1946 by 104,356 participants, or 66 6 per cent

Benefits to participants for the first six months of 1947 were \$1,460,770 During the same period of 1946, benefits to participants were \$684,797 The increase in benefits to participants during the first six months of 1947 was \$775,973, or 113 3 per cent Particular attention is called to the increase in

claim incidence over the previous quarter ending March 31, 1947, in practically all plans

Subcommittee on Public Medical Care -Dr Christopher Wood, chairman, reported verbally as follows "Just two points First, you will recall that the first schedule of reimbursable charges of the Welfare Department remains in effect through December of this year It is anticipated that probably prior to that we will begin to seek upward revision of the fee schedule, and if possible to achieve the same scale as workmen's compensation

"Second, we continue to receive complaints about the payment of physicians' fees directly to the patient You will recall that, although I personally felt that was a good method, last year, or the year before, the House of Delegates went on record favoring the payment for physicians' services directly to the physician Payment to the patient is still a requirement of the US Social Security Board, and the State, as far as we have been able to determine, has no recourse but to follow that requirement. It is no recourse but to follow that requirement rather hoped that in the coming year some revision may be had on that I don't think they will rescind it, but some revision of that requirement may be obtained so physicians in New York State can be paid directly for their services"

Committee on Ethics -The question of ethics, in connection with an advertisement by Dr Thomas H Halsted on page 1532 in the July 1 issue of the Journal, was raised Dr Bauer also brought to the attention of the Council the fact that the New YORK STATE JOURNAL OF MEDICINE WAS being criticized by the A.M.A for some advertisements it

was carrying After discussion.

It was voted to refer this to the Publication Committee, together with an excerpt of Dr Bauer's remarks

Malpractice Insurance and Defense Board —Dr Thomas M D'Angelo, chairman of the Board, presented a report regarding the operation of the

Group Plan of Malpractice Insurance

Committee on Office Administration and Policies —The Committee submitted a report on routine matters, and is continuing its studies in regard to improving the management and policies of the running of the office The removal of the Society's offices in the near future to the seventh floor of the building was discussed

Planning Committee for Medical Policies —Dr J Stanley Kenney, chairman, submitted the follow-"Subject Report on the Group Hosing report

pital Council, Ltd

"Early in the spring of 1947 a group of physicians from metropolitan New York began a series of meetings as a discussion group to debate and study problems encountered in group medical practice, in which in some measure they were all engaged After several meetings they decided to expand the group and invitations were forwarded to a number of others interested in this type of practice, not only in the New York area but generally over the eastern section of the United States

"At this time (May 8) the Medical Society of the State of New York was asked to send a representa-Because of the fact that the Planning Committee for Medical Policies is engaged in studying this problem for the Society, the President, Dr Bauer, asked me to attend the meetings in the capacity of observer and in due course to make a re-

port to the Council

'I have been present, up to now, at four meetings, the most recent of which was on September 4

group has now incorporated and is known as The Group Practice Council, Limited The incorporators are Drs Marshall Brown, Edwin J Grace, Harry J Johnson, Lester C Spier, and Louis R Walberg The legal counsel for this Board is Reed B Dawson, Esq You will recall that Mr Dawson is and has been for many years the counsel for the Medical Society of the County of New York. Some twelve to fifteen doctors have regularly attended these conferences They represent a pretty fair cross section of the various medical groups now active in the Included are such group metropolitan area services as industrial medicine, hospital groups, insurance groups, the university groups now forming, private group clinics, Group Associates (the Summit, New Jersey, group), the Life Extension Examiners, and the Hospital Insurance Plan of Greater New York, better known as HIP, and a number of others

"The aims and purposes of the Group Practice Council are set forth in Part 2 of the Certificate of

Incorporation as follows

"To collect, gather, correlate, and study facts, data, and information relating to all phases of the practice of medicine, both in the metropolitan area of the City of New York and elsewhere, including foreign countries, by two or more physicians or surgeons acting in concert either as copartners, as organized groups, as hospital staffs, as clinics or dispensaries, or otherwise in any manner whatsoever, and to publish and disseminate such facts, data, and information, together with the results of studies made thereon, to interested persons and to the public generally, to foster and promote high standards in the practice of medicine by physicians or surgeons in concert as aforesaid, and to establish standards of practice applicable to the several different types of such practice in concert, and to grant certificates to physicians and surgeons so practicing in concert who shall meet and comply with the standards so established by this corporation, and in connection therewith to own, operate, and maintain such offices and other facilities as may be necessary and proper in order to carry out the foregoing purposes, and in the furtherance of such purposes to conduct its operations exclusively for charitable, scientific, and educational purposes, with no part of the net earnings of the corporation enuring to the benefit of any private member or individual, but the corporation shall not have or exercise any of the special powers or purposes set forth in any of the provisions of Section 11 of the Membership Corporations Law, nor shall it carry on propaganda or otherwise attempt to influence legisla-tion. The "educational purposes" as used herein shall be limited to the publication and dissemination of facts, data, and information collected and gathered by the corporation as hereinabove provided, together with the results of studies made thereon, and the corporation specifically shall not have any purpose for which a corporation may be chartered by the Regents of The University of the State of New York

"The territory in which its operations are principally to be conducted is the metropolitan area of New York City and expansion on a national scale as soon as practicable - in fact invitations are about to go out to representative large groups such as the Lahey Clinic, the Cleveland Clinic, the Sayre Clinic, the Mayo Clinic, etc

In my judgment there seems to be no reasonable criticism of these aims and purposes as set forth

did take exception and interposed objection to that clause referring to the granting of certificates to 'physicians and surgeons so practicing in concert who shall meet and comply with the standards so established by this corporation' I felt this might likely be in conflict with and encroach upon the proper rights and privileges of the county medical societies, and cautioned that organized medicine would be concerned and probably would not go along if this implied any infringement on these rights and privileges However, the meaning of this clause was clarified for me satisfactorily The best minds among this group are distinctly opposed to any conflict with organized medicine. They are idealistic and uphold high ethical principles and they propose to work entirely within the framework of

organized medicine, and desire its full collaboration "As I understand their objective at present, it is to set up a Board or Council which will bear much the same relation to medical practice that the national specialty boards now enjoy, in other words, they are seeking to clean their own house, to adduce and set up standards for qualification and raise the level of group practice to such a plane as will command the confidence and respect of both the profession and the public Their inclusion of representatives of such groups in their current setup as organized medicine is not in full accord with and which it regards with justifiable suspicion is for the purpose of bringing squarely before them what will be expected and demanded of group practice every-

"Up to now all discussions have been along ethical lines and no reference has been made to financial support, fees, etc This group is deeply interested in the resolutions on group practice presented to the House of Delegates of both the State Society and the A M A at their most recent meetings Dr Spier was in Atlantic City and appeared before the Reference Committee, which referred the A M A. resolution to the Trustees with the recommendation that it be studied by the Office of Medical Economic Research, the Judicial Council, and the Council on Medical Service

"I believe our State Society at this time can with interest and profit follow the activities and progress of this Group Council, Limited, and, while not taking any formal action at present, should continue to have a representative attend their meetings"

Committee on Public Health and Education — Dr O W H Mitchell, chairman, reported as fol-

June 27, 1947 In Syracuse, attended a meeting of the executive committee and presidents of the component county societies of the Fifth District

July 17, 1947 In New York City, attended a meeting of the Cult Practice Subcommittee of the Committee on Legislation

July 29 and 30, 1947 In Saratoga, attended the Annual Conference of Health Officers

atrics held at the home of the chairman of the Subcommittee on Geriatrics, Dr Stephen R. Monteith, Nyack.

September 16, 1947 A meeting of the Council Committee on Public Health and Education and the Subcommittee on Physical Medicine was held in New York City Invited to attend this conference were some of the officers of the Medical Society of the State of New York and representatives of the State Departments of Health and Education

Postgraduate Education -Instruction has been arranged for and will be given in the near future in the following counties Broome, Cayuga, Cortland, Jefferson, Monroe, Ontario, Orange, Oswego, and

Tompkins

A Regional Teaching Evening was arranged for the Otsego County Medical Society to be given on September 10, 1947 Invited to attend this meeting were the physicians of Otsego and Delaware county medical societies

Requests for instruction have been received from Clinton, Sullivan, and Warren county medical societies and arrangements are being completed

During the summer months, arrangements were completed for instruction to be presented in Madison

and Suffolk county medical societies

Because the 1946-1947 Course Outline Book was received so late from the printer last year, the Committee plans to distribute a supplement for 1947-1948

BCG Advisory Committee —A meeting has been arranged for the BCG Advisory Committee

Committee on Public Relations -Dr Floyd S Winslow, chairman, submitted the following re-port "News releases concerning events sponsored by the Committee on Public Health and Education were sent to the following counties Cayuga, Madison, Ontario, Oswego, Otsego, Rockland, Tompkins. and Warren

"A news release on the Rocky Mountain spotted fever symposium which appeared in the July 15 issue of the New York State Journal of Medicine was mailed to wire services, daily and weekly newspapers in New York City and Suffolk County

"Mr Dwight Anderson, Mr Edgar L Cook, and Mr Thomas Walsh attended a meeting of the Subcommittee on Cult Practices of the Legislative Com-

mittee at the Hotel Commodore, July 17

"Mr Cook and Mr Walsh attended the 43rd Annual State Health Department Conference at Saratoga, July 28 to 31

"Approximately 9,000 reprints of Dr Bauer's radio talk, 'Do We Need Compulsory National Health Insurance?" delivered over Station CBS 'People's Platform,' May 25, and 2,600 copies of the July issue of The Distaff were maked. Mr. Cook gave editorial assistance and advice to Mrs Sanborn, editor

"Mr Cook continued work on the fifty-year doctor pamphlet memorializing the physicians who have practiced medicine for fifty years or more search for a handbook on the activities of the State Society is being conducted under the supervision of of Mr Cook. Mr Walsh and Mr Cook conferred with Mr Anderson August 13, on the fall schedule of

activities

"In efforts to curtail unlicensed schools and illegal medical practice, Mr Walsh maintained contact with the Department of Education, members of the Board of Regents, Office of the Attorney-General, the New York County District Attorney's office, the

State Society's legal counsel, and members of county societies

"Mr Walsh and Mr Cook attended a special meeting of the Legislative Committee on August 6 Mr Walsh reported the currrent progress of the Wicks Committee and studied the advisability of using injunctive proceedings to eliminate illegal medical practice Mr Walsh and Mr Anderson discussed the early implementation of your committee report on the establishment of a Speakers' Service Mr Walsh continued his work on a report to the Council on cult practices "

Publication Committee —In the absence of the chairman, Dr Laurance D Redway presented the following report "The Committee met at the Society's Offices on Tuesday, September 2, 1947, at 2 PM Dr Redway was instructed to take over as Acting Managing Editor of the JOURNAL in Dr Kosmak's absence during the month of September

"Miss Alvina R. Lewis will replace Miss Willma Simmons as Technical Editor of the Journal as of

November 1

"The Committee is pleased to report that the September 1 issue of the Journal will have reached the membership within a few days of the normal schedule It is hoped that future issues will be mailed exactly on schedule

"The Business Manager was instructed to try to obtain increased paper, even if it is necessary to pay as much as double the mill price, so that an additional form may be added to each issue of the

JOURNAL as soon as possible

"Editorial comment will be made in the October 15 issue of the Journal on Dr Louis H Bauer's forthcoming valuable book, Private Enterprise or Government in Medicine, to be published by Charles

Thomas, Inc.

"The 1947 Directory has been delivered to 16,000 members and 1,654 nonmembers as of August 29, a total of 17,654, delivery of all Directories is expected by September 15 Plans have already been made to commence compilation of the 1948 Directory immediately following the delivery of the last copies of the 1947 issue Compilation will require six to eight months depending on available space and competency of personnel It is planned to add running heads in the 1948 Directory in order that listings for New York, New Jersey, and Connecticut may be more easily found on opening the book."

It was voted that the report be approved

Liaison with the Veterans Administration -Dr Anderton read the following letter from Dr Herbert H Bauckus

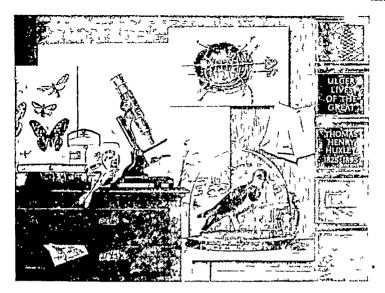

"Dear Dr Anderton,

"I have your kind invitation to attend this meeting of the Council but by this letter I think I may report to you the information necessary at this time

"Our coordinators are working satisfactorily at the branches in New York, Albany, Syracuse, and Buffalo No coordinator has been appointed for the proposed branch in Brooklyn I am awaiting word from Dr Lane on the time for this appointment

"During the summer the coordinators were again asked to report on instances of questionable prac-I am pleased to say that no serious violations are reported although there are two cases pending in which the attending physician, by prior arrangement with the patient, charged an additional fee besides our regular scheduled veteran's fee I think this is not good practice but I do not find the records specifically showing orders against this

the physician's bill and report calls for no statement

regarding this item
"We have suspended a few men for charging for time not actually spent We have had a request from the Veterans Administration for suspension or removal in one case that is being investigated

"There has been a marked reduction in the amount of authorization granted This especially applies to hospitalization, and I should like to say that except in cases of acute emergency, medical or surgical care requiring hospitalization apparently is not available under the private practice plan I have protested this to Colonel Harding in Washington and talked with him by telephone last week. He stated that there has been a shortage of funds and he hopes this will be corrected He knew that there were many problems requiring further study but suggested that we postpone a meeting with him until the American Medical Association Committee has its meeting

early in November
"I therefore feel that most of our negotiations
"I therefore feel that most of our negotiations taken must wait for this date, especially on matters taken

care of on a national basis

"There have been some changes in the methods of procedure in our own plan in New York State have communicated with the Acting Branch Medical Director, Dr. A. M. Kleinman, and objected to the removal from the active lists of physicians who were working part-time for the Veterans Administration There have been objections on the part of the Veterans Administration to physicians receiving an amount of money in maximum of \$6,000 per year There has been added an additional amount of paper work which, however, may be only temporary

"All of these matters and many others will be brought before the Board of Directors at a meeting early in October Following this meeting I shall be able to make a more comprehensive report to the Council"

Committee on Woman's Auxiliary —Dr Fenwick Beekman, chairman, reported there was a meeting held at the Barclay Hotel on September 9 at which Dr Elton Dickson and Dr Beekman met with the They outlined officers of the Woman's Auxiliary and discussed very fully their program for the year It is a good, promising program.

Committee on Workmen's Compensation —Dr J Stanley Kenney, chairman, submitted the follow-

ing report

Reporting of Compensation Cases The issuance of new rules covering the reporting of compensation cases by the Chairman of the Workmen's Compensation Board has created a bit of confusion in various parts of the State in regard to the forms to be used for closing cases On August 28, an inquiry was directed to the Chairman of the Workmen's Compensation Board asking for a clarification of her report dated May 7, 1947 As soon as a reply is received, the membership will be informed

Along these lines an inquiry was received from one of the members of the Workmen's Compensation Committee as to the necessity of filing progress reports in protracted cases where the physician sees the patient at intervals of more than one or two months The present rule requires a report every It was brought to the attention of the three weeks Chairman that under these circumstances it was an unnecessary burden on the physician to report every three weeks where a case is not seen as frequently as

Free Choice of Physician Early this year a complaint was received by the Bronx County Medical Society against a certain self-insured employer who persistently failed to give authorization for certain procedures which under the Workmen's Compensation Law require such authorization This matter was brought to the attention of the Chairman of the Workmen's Compensation Board who was requested to look into the matter since it involved a violation of both the letter and spirit of the Workmen's Compensation Law The matter received the attention of the Chairman of the Workmen's Compensation Board who failed, after the investigation pursued by her, to notify the Medical Society as to the result of the investigation She contended that a report of the investigation "would not be appropriate" She stated, however, that she welcomed the assistance of all responsible parties in advising her when improper procedures come to their attention It is the contention of the Medical Society that it was entitled to know the result of the investigation and whether the practice complained about was abated

Chemung County Seminar Your Director has been asked to act as moderator in a seminar on Workmen's Compensation to be held by the Cheming County Medical Society in Elmira on Wednesday, Septem-

ber 17, 1947

## New Business

Appointments -It was voted that the following appointments be confirmed Committee on Geriatrics (Subcommittee of Public Health

and Education)

Adanon hydrochlaride (6 di methylamino-4 4 diphenyl 3 heptanone hydrochlaride) is a new synthetic com pound with analgesic action comparable to morphine

Indicated principally for the relief of intractable pain of malignancies renal colic fracture and postoperative pain and for supression of cough Not recommended for use in obstetrics or preoperatively Administered orally, intramuscularly and intravenously in doses of from 2.5 to 10 mg

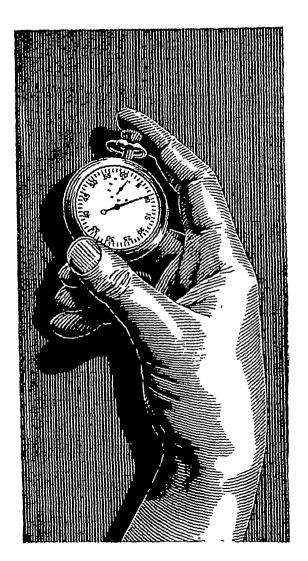

Synthetic Analyzoic and Antitussive

Tablets of 2.3 mg 5 mg 7.5 mg and 10 mg 100's and 500's. Bixtr 15 mg /5 cc.), bottles of 16 ft. ez. and 1 gal. Syrup (10 mg /30 cc.) bottles of 16 ft. ez. and 1 gal. Syrup (10 mg /30 cc.) bottles of 16 ft. ez. and 1 gal. Ampuls of 2 cc. (5 mg /cc.), 10's, 25 s and 100's Viols of 10 cc. (10 mg /cc.)

Warning May be habit forming Harcotic blank required.

CHEMICAL COMPANY, INC.

# Prompt antacid effect

# ... sustained relief

Alminate disintegrates in the stomach in a matter of minutes so that relief is gratifyingly prompt. It is characteristic of Alminate that antacid effect is well sustained so that relief of symptoms is prolonged. A most important advantage is the relative absence of any constipating effect

Alminate Tablets are appreciated by the patient because they are so convenient to carry and so palatable and easy to take One or more tablets are swallowed as required; they need not be chewed.

Alminate Bristol is at your own pharmacist's in bottles of 100 and 500 tablets. Complete literature and a test supply on request.

like nature functioning at her best

Dysmenorrhea due to insufficient corpus luteum hormone not only is alleviated but may be prevented by the judicious use of PRANONE. PRANONE (orally active progestin), simulates nature functioning at her best. Taken for eight to ten days prior to menses, PRANONE furnishes a progestational effect which often results in painless menstruation.

# **PRANONE**

(anhydrohydrox) progesterone)

Unlike most sedatives PRANONE Tablets act physicologically and do not invite habituation even after long, continued use. In many patients, PRANONE helps regulated endocrine dysfunction permanently the menses temaining symptomless after therapy

PRANONE Tablets of 5 or 10 mg. once or, twice daily for 8 to 10 days preceding menter. Ataliable in boxes of 20, 40, 100 and 250 tablets.

## ... SO SOME CHILD PATIENTS ARE BRATS

We can't tell you how to reform them, of course But here's a suggestion that will make things easier for you and the parents in those cases for which the administration of sulfadiazine is indicated Prescribe Sulfadiazine Dulcet Tablets The brats will like them So will cherubs And so, for that matter, will many adults who have difficulty in swallowing tablets and capsules, or who should use sulfadiazine tablets as troches for local effect • Sulfadiazine Dulcet Tablets are candies in appearance, in taste, in odor, and in the way they melt in the mouth Yet they are accurately and scientifically standardized to produce the desired therapeutic result. Sulfa diazine Dulcet Tablets are stocked by prescription pharmacies in two sizes 016 Gm (2½ grs), and 032 Gm (5 grs) They may be chewed, dissolved on the tongue, or taken in a little water Prescribe the same dosages as you would with conventional sulfadiazine tablets Would you like a physician's sample? Just drop a line to Abbott Laboratories, North Chicago, Illinois

SULFADIAZINE DU GETTABLETS

# The importance of flavor in establishing good eating habits

Psychological—Physiological

Pleasurable satisfaction in the taste of food is a definite factor in and an aid to digestion Many bables are particular about the quality and taste of the foods offered them

Flavor cultivates appetite

For the infant's nutritional benefit and eat ing pleasure, Beech Nut offers a group of foods the fine flavor of which is solely de pendent on careful selection and precise packing methods

Standards of care

These include the expert selection of the best in fruits vegetables and meats. Cooking is carefully controlled to retain natural food values as well as flavor in high degree

# Beech-Nut Foods for Babies

A complete line of meat and regetable soups fruits, regetables and desserts.

Beech Nut high standards of baby food production and all Beech Nut baby food advertising have been accepted by the Council on Foods and Nutrition of the American Medical Association

#### "Chronic Cardiac Disease rarely develops in the presence of good body mechanics"\*

Goldthwait, et al,\* found that even when the diseases had developed, the correction of faulty mechanics helped greatly "in reducing the peripheral load, in lessening cardiac strain, and in increasing the patient's usefulness"

We invite the physician's investigation of Spencer Individual Designing as adjunct to corrective treatment of body mechanics A Spencer automatically induces better posture, thereby favorably influencing neuromusculoskeletal performance

Each Spencer is specifically designed, cut, and made for each individual patientbased on a description of the patient's body and posture and detailed measurements That is why Spencer Individual Designing is therapeutically more effective

For information about Spencer Supports, telephone your local "Spencer corsettere" or "Spencer Support Shop," or send coupon below

# **MEAT**

# And Protein Deficiency

While protein deficiencies per se are difficult to recognize in their incipiency, conditions which lead to negative nitrogen balance are well known. The presence of any of the following states which characteristically exert an adverse influence on nitrogen balance, calls for immediate measures to prevent serious protein depletion.

- I Diseases of the digestive organs, which impair proper digestion and absorption
- 2 Wasting diseases, infections and thyrotoxicosis, which increase protein breakdown and need far above normal levels
- 3 Hemorrhage, burns, and chronic exudative processes causing excessive loss of protein

A high protein diet, whenever possible, is considered to be the most effective method of protein administration in the prevention and correction of protein deficiencies

Meat, which readily is eaten two or more times daily, is an excellent component of the high protein diet. Meat is an outstanding source of protein for the following reasons. The protein of meat is biologically complete, capable of satisfying the body's protein needs. The percentage of protein contained in meat makes it one of man's most important protein foods. And, all meat is highly digestible—96 to 98 per cent—an important consideration especially in the presence of disease.

The Seal of Acceptance denotes that the nutritional statements made in this advertisement are acceptable to the Council on Foods and Nutrition of the American Medical Association

### AMERICAN MEAT INSTITUTE

# DEFICIENCY DISEASE— in a Land of Plenty!

Though America is prosperous beyond the dreams of less fortunate countries many recent studies indicate that early and latent forms of scurvy are surprisingly common in many parts of this land of plenty

As you well know Doctor everyone re quires a minimal intake of vitamin C every day but even hearty eaters often fail to get it from their diets. The surest way to see that your patients get their daily requirement is to prescribe SODA SCORBATE the improved vitamin C.

Address

SODASCORBATE provides the only dry form of sodium ascorbate for oral administration SODA SCORBATE is stable, approximately neutral in chemical reaction and free from the irritative and and shift effects frequently experienced with ordinary ascorbic acid.

SODASCORBATE brand of sodium ascorbate may be prescribed wherever vitamin C is indicated Supplied in bottles of 40 100 and 500 tablets Mail the coupon for professional samples and covering literature.

# THANKSII

THE PHYSICIANS' HOME received this letter from an officer of a component medical society.

"I share with a number of my associates a genuine conviction that your modest instrument of service, the Physicians' Home, is doing one of the best possible jobs in human adjustment of which I know

This idea of helping one's own immediate colleagues and their widows in their own home communities gives the kind of direct personal help that tide them over crises and safeguards their future

You have established a broad base to assure this service to the aged, retired members of our profession "

Bondai: Nutritional Prescription Specialties

Better living... better development and wellbeing... require better nutrition. Borden's Prescription Products arm the physician with the solution to practically all infant and many adult feeding problems... effectively and dependably!

#### BIOLAC

A semplete inlantload—when ascerbic acid only is added—for optimum nutrition. Resembles human milk in nutritional values and ease of digestibility

#### MULL-SOY S

A hypeallergenic amulsified liquid sey feed
for patients allergic te
milk, with nutritional
factors approximating
these in cew's milk.
Dilute 1.1 with water.

#### DRYCO

I deal for formula flexibility in infant feeding, with highpretein, low fatand intermediate carbentydrate centent. May be used with or without selded carbentydrater quickly soluble in cold or warm water.

#### BETA-LACTOSE

The natural carbohydrate of
mill - five times more
soluble than alpha lactosu, and much more
palatable! Excellent
ler formula modification for intants, and for
corrective nutritional
therapy in adults

#### GERILAC

Pewdeted medtited milt for special detary uses – for well-reunded nutrition in convolescence and old age. Palatable and readily digestible — only water, needed for dilution

#### KLIM

Spray drind whole milk with soft curd characteristics. Valuable in infant fermulae, peptic ulcer and other special diets, and an ideal replacement for inadequate or unsafe fresh milk.

<sup>\*</sup>Laryngoscope Feb 1935 Vol XLV, No 2 149-154

In patients with congestive heart failure the time to in stitute divires is before the edema becomes obvious. A mercurial diviretic which makes this possible can be used to prevent the damage which mounting fluid burden may do to an already failing heart.

Well tolerated locally as well assystemically Mercuhydrin can be given intramuscularly at frequent intervals and over prolonged periods without undue pain and without tissue injury

Mercuhydrin used in this manner maintains the cardiac sufferer at a constant and adequate water balance. Inter mittent bouts of edema and subsequent need for drastic procedures are avoided. Mercuhydrin in small doses, repeated at short intervals, offers a definite advantage over the larger doses repeated once a week which otherwise may be necessary

Mercuhydrin Sodium is the sodium salt of methoxyoxi mercuripropylsuccinylurea theophylline. It is supplied in both Icc. and 2 cc. ampuls. LAKESIDE LABORATORIES INC. Mulusukee 1 Wisconsin.

# Introducing

## **ARGYPULVIS**

a new adaptation of ARGYROL for Trichomoniasis

The development of ARCYPULVIS extends to an important new field of usofulness—the protozoacidal bacteriosatuc, detergent and denulcent properties of ARCYROL long recognized as an efficient depondable aid in treating infections of the genito-urinary tract.

A new approach to the treatment of Trichomoniasis has been devised and the effectiveness and special advantages of ARCYPLIAIS pointed out, together with a complete absence of observed harmful by-effect.\*

#### Composition

#### Physical Properties Forms

ABGYPULVIS contains powdered ARGYROL (20%) Kaolin (40%) and Beta Lactose (40%) finely milled to provide the

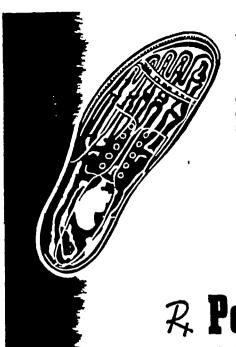

fluffiness which makes for easy insufflation and with an attraction for water which promotes fast action

Whole protein is more efficient metabolically and more practical clinically than any combination of protein fractions designed to be given by mouth. Whole protein is palatable, better tolerated, and acceptable for longer periods of time. 'DELCOS' Granules provide whole proteins of highest biologic value (casein and lactalbumin), protected by carbohydrate, 30%. This unique combination is about 20% more effective biologically than beefsteak. 'DELCOS' Granules are palatable, even in large doses, and easily digested by all but those few patients who exhibit radical enteric dysfunction. When oral protein is indicated, supplement the diet with 'DELCOS' Granules, the protein that patients accept,

dose after dose, day after day.

BCG

In the State of New York, the campaign to oradicate tuberculosus goes forward — The State Department of Health has commenced its production of BCG by the Division of Laboratories, and, as stated in these columns carlier in the year, a well-integrated program has been the subject of much careful planning for the use of BCG for the active immunization of tuberculin negative reactors against tuberculosus in NewYork State

The Council Committee on Public Health and Education of the Society and representatives of the State Department of Health have worked out many essential details of the organization of procedure, a difficult task for a populous state as large as New York.

Interest in BCG will necessarily become more widespread as the public is informed of its use in the campaign against tuberculous. Anticipating for the physicians of the State some inquiry by patients, we present a brief review of the development of this preparation of viable organisms

It may not be recalled that Guérin, collaborator of Dr Calmette, director of the Pasteur Institute in the research and development of BCG, was a veterinarian. BCG

1 New York State J Med. 47: 698 (April 1) 1947

1 "Veterinary Contributions to BCG Vascination" by
Alberto Assoil Vat. Med. 42: 254 (May) 1947

stands, in fact, for Bacillus Calmid Guérin, a strain of Mycobacterium telescope of the bovine type attenuated by the sage through experimental media. Was had begun in 1915 to establish the faction noss to man of the 70th transfer at 150 Belgium, when it was interrupted to German Army which requisitioned was german Army which requisitioned was a superfect to the control of the c

After the war, resuming the mette and Guérin demonstrain strain Nocard (who was anothers as a strain Nocard (who was anothers as a strain notary the strain after passage the ments on bile media and "was no longer the attenuated all refractory to the movirulent tubercle. This was reported in the Annalles de From 1924 to

From 1924 to in the Po v II y, Instituto V which the I eringtians their vaccur be in better control were

afflict
it if he

his life
ecessary

un

ocialized

by an Austrian immunologist that BCG produced characteristic lesions in laboratory animals in Austria. The Veterinary College in Milan, together with the medical schools in Milan and Pavia, collaborated in supervising the experimental work on farm cattle donated by the farmers and kept in isolated stables. It was found that "BCG vaccination protected the calves not only against artificial inoculation with cultures of virulent tuberculosis organisms, but also against natural exposure consisting of constant contact with tuberculous cattle"

At a meeting of experts at the Pasteur Institute in 1929 at the invitation of the League of Nations, the work done in the Povalley in Lombardy was favorably received as was that of Guérin, Dr Watson of Canada, however, receiving them "with reservations" Later, in Oslo, the unfortunate "incident of Lubeck was redeemed by Neufeld" and the "continuation of the use of BCG in human beings" was decided affirmatively

Results of the Italian experimentation on cattle which lasted thirteen years "coincide strikingly" with the results on the American Indians which were presented at the conferences held in September, 1946, at the Tuberculosis Control Division of the US Public Health Service in Washington <sup>3</sup>

In this country, large-scale programs for the use of BCG are being developed in the war against human tuberculosis, not only in New York State, but elsewhere The State of Illinois has authorized construction of a \$361,000 institution for tuberculosis prevention on the Chicago campus of the University, which contemplates the large-scale production of BCG

The European veterinary contributions to the development of this vaccine have been In this country, the tuberculosis eradication program which has been operating for twenty-five years has gone very far in climinating the disease in cattle Tuberculm testing as practiced here has not revealed in any state "as many as one-half of one per cent positive reactors to the tuberculin test on the last complete survey " The quotation is from a letter from Dr William A Hagan, Dean, New York State Veterinary College, Cornell University, Ithaca, Dr Hagan says further New York feel, however, that we will have to continue the program that has been so successfully operated, and which has made of this disease a very minor problem in the country"

From this it will be seen that no vaccination program for cattle in this country has been necessary, and that it would only complicate the tuberculin test which has served so well to reduce the disease here to "a very minor problem" in cattle

Carefully controlled use of BCG for the reduction of tuberculosis in human beings may well serve to reduce still further the incidence of the disease in cattle since, as Dr Hagan reports "In at least two instances that I know of in New York (State), it was shown fairly conclusively that the owner was harboring bovine bacilli in open pulmonary lesions and it was from the owner that the cattle became infected"

#### The Hysteric in General Practice

We have just read and reread an article under the above title appearing in a British medical journal <sup>1</sup>

The British character has qualities that we conspicuously lack. It is not excitable. It is not talkative. It thinks. It is rather self-deprecatory than otherwise, but when it troubles to unburden itself it often comes up with something very well worth listening to

Dr Lester's article is based on the study of a single case. She is a married woman crowding fifty, the mother of a single daughter. He has studied her from the Freudian, Adlerian, and Jungian points of view. He has gone with equal care and detail into the personal histories of her husband and her daughter. He gleaned invaluable facts of her childhood from an aunt who lived nearby, and, we gather, never could abide the child

<sup>\*</sup>Tuberculosis Control Issue No 4 Public Health Reports 61 23 (1946)

<sup>4</sup> Herald Tribune (July 20) 1947

<sup>1</sup> Lester Wilfred The Practitioner 158 425 (May) 1947

She is an outwardly well-nourished, cheerful, placed woman who, to the casual observer, would seem to be bearing up extraordinarily well under the mexplicable multiplicity of ills to which for years she has been a prey She never knows when her heart, her back, or her internal organs are going to give way under her But they are always doing so, oddly enough on occasions when she is not the center of the picture peoples' weddings, other peoples' birthday parties, her husband's lodge nights, her daughter's rare evenings out with her young man, frequently seem to precipitate an attack which requires that everyone's un divided attention be centered on Mother

To be sure, she always recovers, but it is always a jolly near thing. And the oddest part of it is, my dear, that those doctors can never find anything the matter with her. In fact, doctor after doctor has told her, in no uncertain terms, that she was nothing but a hypochondriac. She didn't know what that meant, but she made very certain that users of the term never again crossed her threshold. In fact, her battles with the stupid, incompetent, unsympathetic members of the medical profession are the staple of her conversation.

Dr Lester has written such a masterpiece that in attempting to condense it we feel like someone, not Walter Pater, trying to describe the Mona Lisa At that, "our eyelids are a little weary"—already—as are those of everyone who has come in contact with this fearful woman

She was the seventh and unwanted child of an irritable, worn out mother and a kindly, reckless, drunken father She nursed at the breast for two years and then became an un breakable thumb sucker A man exposed himself before her at the age of six. On the death of her father, when she was four, her mother had to go out to work and she had to go to school There she did fairly well, except when she suffered inexplicable attacks of vomiting which prevented her from ever taking examinations. She got along well with other children except that—this detail was supplied by the acid aunt—they must

always be younger than she. She was ardently woodd by a very masculine sailor, but rejected him because of his very ardor After four years' courtship she married a sorter of mail in the post office whose avocation was the raising of rabbits in the backyard had been previously an officer in the Boys' Brigade He took great pleasure in his uni After two years of tentative, shy, form fumbling, mutually unsatisfactory attempts at consummation of matrimony, she presented her husband with a daughter, but the experience was so unbearably horrible that their matrimonial relations dwindled to what might be called token performances, occur ring perhaps twice a year, on birthdays

Dr Lester, after years of patient effort, finally succeeded in so enlightening the various members of the family that their attention to "the attacks' lessened Her husband and her daughter were still kind and solicitous and affectionate, but the husband managed, in spite of them, to get to his lodge meetings and the daughter to go out with her young man And under such a policy of judicious neglect the mother herself eventually improved How the doctor managed to bring this about without getting himself fired from the case is a riddle to which only Dr Lester holds the key But the reporting of one such case as this is worth pages upon pages of statistics.

We think the article of great importance for two reasons. First, because there is no doctor—and we use the term advisedly—whether the doctor be general practitioner or specialist who will not immediately recognise many of the characteristics of Dr Lester's Mona Lisa in his own practice.

Second, because it shows what a mere doctor without special psychiatric training can do by sympathy and understanding to been one of the greatest heartaches that afflict people in general. He could not dor' if he were a full time professor, even if be had the vague wish to try to do so, becare his life would not have furnished hum the recessif

If he were practicing und Society

#### Current Editorial Comment

Charity—It Needs a Follow-up System Thirty years ago a surgeon who removed a patient's appendix and was so fortunate as to have the patient leave the hospital under his own steam, so to speak, was adjudged to have done a good job, and the hospital proudly wrote down that patient on its record as "cured" There were optimists in those days Nowadays patients are fol-Relentless social workers camp upon their trails They point out that even minus an appendix a patient, unhappy at home, will go on to develop gastric or duodenal ulcers, mucous colitis—gracious Heavens, won't they get? Is there, nowadays, a surgeon who is fatuous enough to think that the unassisted knife can cure anything? Not if he's heard of psychosomatic medicine Follow-ups may be discouraging, but we believe in them in principle So we print the gist of a letter, received from a correspondent the other day

I live on what I am sure you would call a civilized block in New York City. It is in a neighborhood which has become fashionable in the last twenty years. Certain properties on my block have remained unchanged. One of them is a brownstone house of conventional design, whose stoop sticks out like an unblown nose in the middle of a row of stoopless, remodeled, repainted houses. The done-over houses are inhabited by sculptors, playwrights, authors, doctors, and business men, people of fairly moderate means, but, perhaps, above-the-average in intelligence.

The brownstone front has a blue enameled sign in front of it which says Hospital Street Quiet Please Otherwise there is no designation on it to mark it as a hospital For years I passed it numbers of times every day, without a thought except as to its outward ugliness. Then I found out what it was A home for unmarried mothers. I have never seen the blinds up on the front of the house. Neighbors who live at its sides and in its rear assure me that the blinds are never up there, either. In its sepulchral interior its unfortunate inmates sing hymns.

The chatelaine of this establishment is a woman of doubtful age who, among others, has a hatred for dogs. Most of the dog owners on the block keep their dogs on the leash and in the middle of the street. She insults the feminine dog walkers, intimating that instead of having dogs they should have babies. She throws lysol upon her next door neighbors, innocently sitting of an evening in their own back yard. She spies upon a

lady connected with the theatrical business who had the temerity to bring home some men to her apartment after an evening rehearsal to discuss changes in the play, shouting insults at her from her window

When complaints were made, the "charitable organization" that is so tenderly solicitous for the welfare of unmarried mothers, replied apologetically that it knew she was not the ideal woman for her position, "but that there was Something in the Terms of the Will that made the Trustees responsible for her upkeep until she died" By lumping her with the unmarried mothers they were Saving Money for the Benefit of Posterity

Charles Dickens died in 1870 If he had written this chapter of New York life before he died we would have had difficulty in believing it But it's true

We believe our correspondent, because we have investigated the circumstances ourselves. It supports our argument that charities, as well as surgical services, are in need of Follow-Up Services.

The Doctor-Descending Scale Some weeks ago we encountered an old friend at a funeral He said he must be getting old That is a conclusion frequently reached by attendants at classmates' funerals, but, curious, we asked him why He said because the whirling particles on the kaleidoscope of his mind were beginning to settle down and take shape Indeed, some of them formed definitely remembered pictures

"Such as what?" we asked

"I'll lot some down for you," he said Some days later he sent the following

When I was in college a classmate asked me to dinner at his home in Boston In flattered timidity I accepted His father, then, was to surgery in Boston what Osler was to medicine in Baltimore

We went into the library It was a typical Beacon Street rear room library If you want to know what it looked like I refer you to The Late George Apley It was the library of a man in very comfortable circumstances A pleasant open fire warmed it Before the fire, upon an old-fashioned reclining chair with an adjustable back, reposed a man A big man, not fat, but solid He had plentiful white hair and a sweeping snow-white cavalry moustache His cheeks and his big nose were red, but of an outdoor redness, not the dull

purple of small ruptured veins His right foot was well elevated on a stool and at his right hand, on a small table, stood a half empty bottle of Burgundy and a glass As his son introduced us he waved a genial hand, indicating his foot

"Gout, you know Can't get up Eight operations today Tired." He pointed to the bottle "Shouldn't drink it, but, after all, muzzle not the ox that treadeth out the corn A man

must have some joy in life."

He was one of the most respected citizens of Boston. To have him take our your appendix was the equivalent of knighthood. As I recall, he had a very pleasant life, died no sconer than he should have, in spite of his well known fondness for his bottle, and was mourned by grateful friends and patients from every walk of life. I never heard of anyone envying him his carriage his horses, or his house on Beacon Street. On the contrary Boston was proud that it had been able to support such a man in the comfort the community felt he merited.

Fifteen years or so later, I found myself again in Boston I was at a medical dinner and the subject of full-time professors was under discussion. Someone remarked that fifteen thousand dollars a year was ample for their maximum salary.

"Not in New York City," I observed

The comment was received with lifted eyebrows all around the table I was annoyed

"A professor has a certain state to keep up" I said "He is supposed to entertain vixining firemen His household and his table should seem worthy of a professor He is supposed to give his children the same educational advantages he himself enjoyed He and his wife are supposed to dress according to a certain standard, so that they may reflect credit on their University They are supposed to go abroad, so that the professor may join International Societies and so that his name may be known far and wide upon the face of the carth Try and do that in New York on fifteen thousand a year'

A professor of the type mentioned addressed me in a tone of strained tolerance tinged with contempt for my avarice

"Ah, but Doctor," he said, send your children to the public schools."

"Did you?"

He turned quite red "No," he answered

"Why not?

"My wife wouldn t let me." His wife, I discovered later, was a very charming fastidious and wealthy lady No doubt he had forgotten that My last experience with a Full Time Man was under the roof of one of our best known Medical Schools. He was evidently proud to be in charge of a hospital service of two thousand mice. One thousand were of a strain predisposed to cancer The other thousand were not. The doctor supereted that cancer might be induced by feeding the noncancerous mice on the milk produced by the cancerous strain. In order to do this he had to learn to milk a mouse He had done so, I saw him do it

We are grateful to our friend for these three vignettes To some they may seem totally unrelated scraps of reminiscence. They don't seem so to us They illustrate very well the disturbing chronicle of what is happening to the doctor during the span of less than one man's lifetime.

The first picture is that of the doctor as one of the most respected men in his community. The better living he made the prouder his neighbors were of him because he made them proud that they were able, properly, to support a man to whom the entire community, neh and poor, were grateful

In the second the doctor depends on someone else for his livelihood. There is nothing For centuries mens unusual about that love has been tempered by considerations of money But, then, he, from the stronghold of his uxorious independence, presumes to impose upon others less fortunately circumstanced his ideas about what he thinks a full-time professor should earn Those who accept his terms are submitting to the judgment of others the amount of the reward they think is fitting the world should grant A most important and significant step downward from the path of rugged individualism A doctor expects a layman when he is sick, to do what the doctor orders Why, then, when the layman is well, should the doctor submit to the dictation of men who in their time of trouble turn to him as a man of superior wisdom? It is entirely a matter of money The power of the purse We admonish the members of our profession to be careful and realous of the independence they relinquish for the new hospital building or for the glitter of the title of professor As for picture number three. Conceded

that from the labors of such men there may eventually come a cure for cancer We applaud them for unselfish zeal But why waste four years of the coveted privilege of medical education on the type of man who wants to—or has to—spend his life riding herd on muce? Int't that using buckshot to

shoot snipe? We can't help thinking of the monks who packed the monasteries of the Middle Ages, and for three meals a day would do anything from cleaning the cowstables to illuminating manuscripts for the Greater Glory of God Only today we call it for the greater glory of Research

Nurse Shortage Continues To those who had hoped for alleviation of the wartime shortage of nurses by now we can bring only bad news Says the New York Times 1

Although there are more professional nurses in the United States today than ever before, the wartime shortage of nurses still exists, and is in many ways even more acute than at the The number of registered height of hostilities nurses in the United States has increased from 295,000 in 1931 to 317,800 in 1946, but the number of patients entering hospitals increased during that same time from 7,058,000 to 15,159,-000-a 13 per cent increase in the number of nurses, but more than a 100 per cent increase in the patient load Last spring the American Hospital Association reported that 16 per cent of the hospitals in the United States had a total of over 33,000 beds closed because of lack of nursing personnel

Nor does the situation appear to be easing, for only 30,899 student nurses were admitted to training in 1946 compared with 56,567 in 1945. Failure to attract suitable candidates to the field of nursing in sufficient numbers has been attributed to a number of factors—competition of other occupations, no more wartime patriotic appeals, and the end of funds provided by the Bolton Act, supplying individual subsidy for cadet nurses

Reduction of working hours from 48 to 40 in New York City hospitals, in effect now for a year, together with minimum salaries increased by \$600, seems to have failed to attract more nurses. In city hospitals of New York, according to the Commissioner

of Hospitals, about 2,400 positions remain unfilled

What is the solution? The Times suggests that

The ultimate solution of this problem can only be met by a long-range educational program that will provide more students of nursing However, it is felt by many leaders in both the nursing and medical professions that nursing education must be reorganized so as to provide nurses in three categories highly trained teacher, research worker, and top administrator in all fields of nursing, (2). the trained graduate nurse, who would operate primarily in a supervisory capacity and in the highly technical field of nursing requiring special professional judgment and skill, and (3) the practical nurse, who could be trained in a much shorter period of time and who would perform the average duties of bedside nursing under adequate supervision

This is a long-range program However, the present emergency can only be met by some immediate action

We submit that, granting the validity of the program suggested by the *Times*, it would be well also to inquire into the reasons why young women no longer, apparently, are minded to enter nursing as a profession. Have we opened so many more attractive careers to women that the older standbys of teaching and nursing have lost their allure?

Surely the teachers as a profession have taken a beating by reason of public indifference to their appeals for a decent wage. No one will deny that student nurses and others in the past have been exploited by the institutions for which they worked and by unreasonable demands on the part of individual patients. Are we now reaping the rewards of such past folly in the indifference of young people toward nursing as a career?

#### THE EFFECT OF ANESTHESIA AND SURGERY UPON PATIENTS WITH PULMONARY TUBERCULOSIS

WILLIAM M PARKE JR MD EDWARD R LOFTUS MD \* and HAROLD F BISHOP MD,
Valhalla, New York

(From the Grasslands Hospital Valhalla New York)

THIS is a preliminary report of the extra thoracic procedures. A similar review of effects following major chest surgery is to be reported at a later date.

The patient with pulmonary tuberculosis who requires surgory has always presented a problem to the anesthetist. Frequent publications in the past have discussed the problem of the choice of anesthesia with a view to minimising the extension of the pulmonary discase. 12 The alterations in physiologic response to various anesthetic agents and technics were discussed and certain concepts formulated. 2-7

In this paper, a series of anesthetic administrations on patients with pulmonary tuber culosis is reviewed with regard to the spread of disease in the postoperntive period, and the results are presented. All types of anesthetic technics and agents, except local infiltration and topical application, have been utilized. The series includes emergency and elective ther apeutic and diagnostic surgical procedures. The analysis of the course of the disease in the postoperntive period is presented in relation to (a) status of the pulmonary disease at the time of operation and (b) technic and agents employed for anesthesia.

The analysis of the status of the pulmonary tuberculosis at the time of operation will be presented first. The cases are divided into two major groups those with active pulmonary tuberculosis and those with arrested disease. For purposes of evaluation of the individual case we have classified each by its clinical and roentgenologic appearance at the time of operation. Minimal disease includes slight leasuns without demonstrable excavation confined to a small part of one or both lungs but the total extent of lessons regardless of distribution does not exceed the equivalent volume of lung tissue which lies above the second chondrosternal

junction Moderately advanced disease in cludes slight, disseminated lesions which may extend through not more than the volume of one lung or its equivalent in both lung fields, or dense and confluent lesions extending through not more than the equivalent of one-third the volume of one lung. Cavitation, when present, does not exceed 4 cm in diameter. Far advanced lesions include any excess of these conditions.

Clinical evaluation of arrested disease is that in which constitutional symptoms are absent. Sputum must be negative on concentration for tubercle bacilli. Lesions must be stationary without evidence of cavitation by x ray conditions must have existed for a period of six months the last two of which the patient has been taking one hour of walking exercise twice Quiescent disease is that in which there are no constitutional symptoms Sputum may contain tubercle bacilli Lesions are stationary by x ray and a cavity may be present. These conditions must have existed for at least two months during which time the patient has been ambulant. Active disease is that in which x ray discloses incompletely healed lesions, positive sputum, and symptoms present in various degrees

These requirements are essentially those of the National Tuberculosis Association and, except those cases classified as 'quiescent' are included by us as 'active'.

Of the 282 anesthetic administrations, 208 were to patients in various stages of active pul monary tuberculosis, and 74 were to those with arrested disease. It has been observed in this entire sense that the incidence of extension of the disease as determined by radiographic means was 10 9 per cent in the one-month period fol loving surgery. No patient with arrested disease showed evidence of spread

The distribution of patients in accordance to the stage of pulmonary tuberculosis at the time of operation reveals that the largest number

Presented at the 141st Annual Meeting of the Medical Roclety of the State of N w York Buffalo M y 7 1917 Section on Artsthesiology 6 Dr Lottum and Dr Parke poke by invitation.

were far advanced and, following in order, moderately advanced, minimal, and primary Eight cases are grouped separately, as the exact stage of pulmonary tuberculosis was not determined (Table 1)

TABLE 1 —DISTRIBUTION OF CASES BY STAGE OF PULMON-ARY TUBERCULOSIS

	Far- Ad- vanced	Mod- erately Ad- vanced			Not Deter- mined	Total
Cases with ac tive pul- monary tu berculosis Cases with ar- rested pul-	141	50	12	2	3	208
monary tu berculosis	24	17	24	4	5	74
Total cases	165	67	36	6	8	282

The incidence of spread in this distribution shows that the highest percentage (132) per cent occurs in those groups classified as minimal, (138 per cent), and far advanced, (133 per cent)

In the latter, this figure (133 per cent) is based on 22 extensions (18 patients) in 165 procedures. However, in the former group of 36 procedures, the 5 which showed extension of the pulmonary tuberculosis occurred in 2 patients, giving an incidence of 138 per cent

The group classified as moderately advanced consisted of 68 procedures and had 4 spreads on 4 individual patients, representing 5 9 per cent

TABLE 2—Incidence of Postoperative Extension of Pulmonary Tuberculosis by Stage of Disease

	Perce Far Ad- vanced	ntage Mod- erately Ad- vanced	Mini- mal Per cent- age	Prim-	Not Deter- mined
Incidence of spreads in ac tive cases Incidence of	15 6	8	41 6	0	0
spreads in ar- rested cases Incidence of	0	0	0	0	0
spreads in en tire series	13 3	5 9	13 8	0	0

The presence or absence of tubercle bacilli in the sputum was thought to be a possible factor inciting extension of the pulmonary disease. The arrested cases, by definition, have negative sputum. Therefore, we shall examine only the active cases in considering this factor. It was found that 108 patients had positive sputum at time of operation and of this group 22, or 204 per cent, showed spread in the immediate post-operative period. Of the 100 cases with negative sputum, 9, or 9 per cent, showed evidence of extension in the same period.

TABLE 3 -BACTERIOLOGIC FINDINGS

	Total Cases	No Spread	Spread	Percent- age of Spread
Incidence of positive sputum in active cases	108	86	22	20 4
Incidence of negative sputum in active cases	100	91	9	9

Thirty patients in the entire series manifested laryngeal tuberculosis and in 10 of these the pulmonary lesions spread. Every one of the 10 had positive sputum on concentrate at the time of operation

TABLE 4 —Incidence of Extension in Relation to Collapse Therapy

With collapse therapy Without collapse therapy	Total Casea 81 125	No Spread 72 105	Spread 9 22	Percent age of Spread 11 2 17 6

Collapse therapy of various forms which included pneumothorax, both intra- and extrapleural, thoracoplasty, and phrenic crush totaled 81 cases in the active group. Of these, 112 per cent, or 9 cases, evidenced extension of the pulmonary disease. Eight of these 9 cases also had positive sputum. The remaining cases in the active group without collapse therapy number 125. Twenty-two, or 176 per cent, of this number spread.

The most common type of pathologic lesion seen in this series of cases with active pulmonary tuberculosis is the combined evidative-productive type. There are 154 cases in this category, of which 19, or 123 per cent, showed evidence of extension following the surgical procedure. Patients with an exudative type alone numbered 29, 6, or 207 per cent of these spread. The productive type disease was found in 20 cases, and of these 6, or 30 per cent, had extension. These observations, except for the incidence found in cases with the productive type of disease, would appear to be as expected.

This series of cases is about equally distributed between men and women, not only in the total but when divided into groups of arrested or active pulmonary tuberculosis. Also, the incidence of spread is as evenly divided between the seves

When the racial distribution is reviewed, it is found that most of the patients are white, with an incidence of 97 per cent spread. The negro patients made up 18 per cent of the total number and had a higher incidence of spread, 16 6 per cent, than the white group. Only 5 Chinese patients were operated on in this series. One of these spread in the postoperative period.

#### Types of Anesthesia

Spinal Anesthesia -One hundred and six

spinals were given, and of these 12, or 11 3 per cent, showed spread. It had been necessary to supplement the spinal in 6 instances, 4 with cyclopropane and 2 with sodium-pentothal. One

of the later group spread

Reynord Block Anesthesia.—Sacrocaudal, bra
chial, abdominal, intercestal, and field blocks
are included in this group of 52 cases. Three,
or 57 per cent, exhibited spread in the postoperative period Each of these spreads followed
a surgical procedure for which a transsacral cau
dal block had been given. Eight of the regional blocks were supplemented with general an
esthesia, 5 with cyclopropane and 3 with pentothal-sodium. None of this group showed
spread of the pulmonary tuberculesis in the
postoperative period

Intravenous Anesthesia.—Intravenous anesthesia using pentothal-sodium in a 25 per cent solution was employed 51 times as the primary anesthetic for short operative procedures. In instances, or 9.8 per cent, there was spread of the pulmonary subgreates within one month

Inhalation Anesthena - Inhalation anesthesia was used as the primary technic 73 times with 11, or 15 per cent, spreads. Cyclopropaue was the agent administered in 59 of these cases. 9 or 152 per cent, of these spread Ether was used only 8 times and showed an incidence of 2 extensions, or 25 per cent, of the pulmonary di sease. In one of these cases, ether was used fol lowing a cyclopropane induction and in the other it was used with avertin. Both procedures were bronchoscopic examinations and both were performed on the same patient within a month and a half The other agents used were Vincthere which was employed in only 4 instances and nitrous oxide in 2 There were no spreads with agents

In the series of 232 extrathoracic procedures, endotracheal tubes were used on 24 occasions Following 4 of these procedures, an incidence of 16 6 per cent, there was extension of the pulmonary disease. Laryngotracheal at the time of operation in 30 cases Endotracheal intubation was performed on 4 of these cases, only 1 of which spread post-operatively

Surgical procedures on the upper abdomen on patients with pulmonary tuberculosis have generally been considered to increase the possibility of spread of the pulmonary disease. In this series, 60 major operations were performed upon the abdomen using various anesthetic agents and technics. Forty-eight were upon the lower abdomen or kidney, 13 upon the upper abdomen. There was a total of 7 spreads, 6 following the procedures on the lower abdomen and 1 following a jejunostomy

For distribution according to surgical procedure for all cases, see table 8

When the individual patients who showed extension of the tuberculous pulmonary lesions in the postoperative period are reviewed individually, it may be seen that certain of these patients show very definite time relationship between the surgical procedure and the chest In other cases, however, the replate findings lationship is questionable—In these latter, certain ones were already following a progressively downhill course when surgery and anesthesia were in-In others, it may be seen that several anesthetic administrations were given to a single patient within a short period of time and it is impossible to determine which procedure, if any, might have been the cause of the spread patients had, in addition to their pulmonary tuberculosis, other serious pathologic conditions which caused the demise of the patient before definite evidence of a questionable spread could All patients who showed exbe established tension of their pulmonary lesions in the postoperative period, whether the spread was definitely related to the operative procedure or suspected of being so, have been included

Following is a brief resume of the clinical status of each patient that spread, including (a) status at the time of operation, (b) operative procedure, (c) anesthetic agent and technic, (d) duration of anesthesia, and (e) postoperative course

#### Far Advanced Pulmonary Tuberculosis

Case 1—M A, a white woman, aged 45, with exudative-productive cavitary disease, highly positive sputum, complicated by laryngeal broncheal tuberculosis, showed progressive extension for at least six months following a second-stage thyroidectomy Cyclopropane inhalation anesthesia through an endotracheal tube was administered for one hour, using to-and-fro carbon dioxide absorption technic

Case 2—E B, a negro man, aged 30, with severe symptoms, positive sputum, exudative-productive disease, and laryngeal complications, showed progressive spread and died (of a hematogenous dissemination) three and one-half months following incision and drainage of the right elbow. Cyclopropane inhalation anesthesia was administered for forty minutes.

Case 8—C E, a negro man, aged 26, with positive sputum and evudative-productive disease, showed spread to the opposite lung within one month post-operatively and then no further change for at least six months. The operative procedure was incision and drainage of a perirectal abscess under 2½ per cent pentothal-sodium (400 mg) and took fifteen minutes.

Case 4—J F, a negro man, aged 35, with severe symptoms, positive sputum, evidative-pneumonic type disease, with effective pneumothorax, spread progressively and died four months later following an incision and drainage of a perirectal abscess. This

procedure was performed under a transacral caudal block and took thirty minutes

Case 5—H G, a negro woman, aged 35, with positive sputum, evudative-productive disease, who had a thoracoplasty done six years previously, died twenty-one days after a hysterotomy and sterilization. The postmortem findings showed a recent bronchogenic spread. Spinal anesthesia was given for the procedure using pontocume-procaine mixture and the level was established at T-7. The procedure lasted one hour, with hypotension being the only complicating factor.

Case 6 —F G, a white man, aged 41, with positive sputum, pneumonic exudative-productive disease, complicated by carcinoma of the pancreas, was following a progressively downhill course at time of operation. He died of carcinomatosis and peritonitis six days postoperatively. A jejunostomy was performed under cyclopropane inhalation anesthesia using an endotracheal tube and to-and-fro carbon dioxide absorption technic. Duration was one and one-quarter hours. There were no complications during the administration.

Case 7—R H, a white woman, aged 26, with moderately severe symptoms, positive sputum, condative-productive disease, complicated by bronchial involvement, showed evidence of spread in the first month postoperatively and no further change for at least six months thereafter. The operation consisted of a fistulectomy performed under precaine spinal anesthesia (level T-6) in a fifty-minute period.

Case 8—B L, a white woman, aged 19, with negative sputum and pneumothorax, manifesting evidative-productive disease, showed a questionable extension of the pulmonary lesions in the first month postoperatively which became definite at three months. The procedure was a retrograde pyelogram done under pontocaine-procaine spinal anesthesia. The level of anesthesia established was T-4 Duration of the procedure not recorded.

Case 9—A J, a negro man, aged 28, with far advanced tuberculosis and large right upper lobe cavitation, had had a first-stage thoracoplasty two months prior to this procedure. His disease was apparently not stable. He had shown evidence of prior bronchiogenic disseminations which again appeared at the time of this procedure, which was an incision and drainage of a chest wall abscess under intravenous pentothal-sodium, 450 mg of a 2½ per cent solution. The duration was fifteen minutes and there were no complicating factors.

Case 10—M M, a 39-year-old white woman, had four procedures in one month's time. She had positive sputum, exudative-productive disease, bronchial tuberculosis, and had had an extrapleural pneumothorax one week before this group of procedures. She showed evidence of extension of her pulmonary disease two weeks after the final procedure, followed a progressively downhill course, and died within a month after that. Each procedure consisted of changing chest wall packs and in each case the anesthetic was cyclopropane inhalation with to-and-fro carbon dioxide absorption technic. The duration

was between thirty and forty five minutes each time.

There were no complications involved in any of the four administrations.

Case 11—W M, a white man aged 40 with hematogenous dissemination, positive sputum availative disease and laryngeal involvement, showed progressive extension of the pulmonary tuberculous postoperatively and died three months later A second-stage Mikulics operation was performed under pontocaine-dextrose spinal anesthesis in one hour and fifteen munutes. Seventy five milligrams of pentothal-sodium in a 21/rper cent solution was administered to relieve restlessness 4

Case 12.—A. M., a white man, aged 32 had a hemorrhondectomy under sacrocaudal anesthesia using 50 ec. of 1 per cent novocaine with 1 40 000 cobefrin. The procedure lasted one hour The pulmonary disease was far advanced at the time of operation and within a wook he developed a bronchoploural fistula, resulting in a mixed pyogenic and tuberculous empyema and death within two wooks following surgery

Case 15—J O a negro man aged 50 with severe symptoms positive sputum exudative pneumonic disease compileated by generalized hematogeneus tuberculosis had an opididymectomy under pontocalne-procedine spinal anesthesia. The procedure took one hour The patient showed x-ray evidence of massive bilateral pneumonic type of tuberculous involvement of all lobes within twelve days following the operation. His course, thereafter was progressively but slowly downhill and he died five months later

Case 14.—D R., a white voman aged 27, with positive sputum exudative-productive disease, and pneumothorax had an excision of a rectal fistula under sacrocaudal anesthesia. The procedure required one hour Within a month there was x-ray ovidence of extension of the pulmonary disease. This was evidently transient in nature for within three months x rays showed some clearing of the lesions

Case 16—C 8 a white man, agod 58 with severo symptoms positive sputum exudative-productive duscase complicated by bronchopleural fistula and empyema, had an incision and drainage of a cold abscess of the chest wall under intravenous pentothal-sodium 2½ per cent The procedure lasted ten minutes and 625 mg of the drug were used X ray showed increase in the pulmonary lesions at one and one-half months postoperatively but there was no further spread in the six month period following thereaster

Case 16 —A. T a white man agod 35 with negative sputum exudative type pulmonary disease complicated by bronchopleuro-cutaneous fistula and Potts disease of the fourth fifth and sixth dorsal vertebrne had two operations for incison and drain age of the Potts abscess within a one-month period. On both occasions, cyclopropane anesthesia was aministered, the second time through an endotraches tube. A large amount of purulent material was apsirated from the trachea during induction and maintenance during each administration. The first anesthesia lasted thirty minutes and the second fifty minutes. Within two weeks of the

procedure there developed x ray evidence of pneumonic extension. There was further spread following the second procedure. The patient expired within three months of the second procedure having followed a progressively downhill course.

Case 17—L. U. a white woman aged 20, with moderate symptoms positive sputum exudative pnoumonic disease, complicated by tuberculou enteritis, had an exploratory laparotomy under pontocaine-procaine spinal anesthesia. The procedure lasted one hour Postoperatively repeat x rays showed continued increase in a diffuse tuberculous infiltration throughout both lungs and the patient expired within two and one-half months.

Case 18—M. W, a negro woman aged 51 with sovere symptoms, positive sputum, productive-type pulmonary disease complicated by carcinoma of the bladder and pyelonophritis had a cystoscopic examination under procaine spinal anosthesia. The level was established at T 10 Duration of the procedure was not noted. The patient had a rapid downhill course and died on the eighteenth postop-

#### Moderately Advanced Pulmonary Tubercu losis

orative dav

Case 19—T C a white man aged 36 with positive sputum, moderate symptoms exudative-productive disease noted as unstable at time of operation complicated by laryngeal and scrotal tuber culcers, had an amputation under procaine spinal aneathesia of the right scrotum and contents. The level was established at T 10 and the procedure lasted one hour and twenty moutes. The first postoperative x-ray taken one month later showed a questionable extension of the pulmonary keions, which was proved by later x-rays to be definite.

Case 20 —P H a white woman aged 25 with moderately severe symptoms, positive sputum, crudative-productive disease, had an appendentomy under procalue spinal anesthesia. The level was not noted. The procedure took one hour Thore was increase in sputum postoperatively and by x ray in the third postoperative week, there was evidence of extension of the pulmonary lesions. This cleared somewhat within another month.

Case \$1 — B. L. a Chinese man, aged 63, with negative sputum, few symptoms, exudative-productive disease complicated by hyportension and squamous cell carelnoma of the tongue had a hemi glossectomy under nitrous oxide and intravonous pentothal-sodium anesthesis. An endotracheal tube was utilized The procedure lasted one and one-half hours and 500 mg of 2½ per cent pentothal used There was some extension of the pulmonary lesions by x ray one month after the operation with months this extension had retrogressed and the cavity collapsed. No further extension was noted in the next three years.

Case 28 — R. P a white man, aged 20 with positive sputum exudative-productive disease, compile cated by hematogonous dissemination had an opididymeetomy under pontocaine-dextrose-ophedrine spinal aperthesis. The level was established at T

12 and the procedure took one and one-half hours An x-ray revealed a spread of the pulmonary lesions within the first month postoperatively but a checkup at three months showed no further change

#### Minimal Pulmonary Tuberculosis

Case 28—M B, a white man, aged 60, with negative sputum, productive type disease, had two stages of a suprapuble prostatectomy done within ten days. Both stages were done under spinal anesthesia, the first with pontocaine-procaine with the level at T-7, the second with metycaine and the level reached T-10. The first procedure took one and one-half hours and the second one hour. The postoperative course was uneventful until one month after operation when the patient developed a fulminating tuberculous pneumonia and expired within two weeks.

Case 24 -E C, a white woman, aged 37. with negative sputum, productive type disease, complicated by marked emphysema and severe asthma, was bronchoscoped twice within six weeks bronchoscopy was performed under ether and avertin and took thirty minutes The second, five weeks later, was done under ether after a cyclopropane induction and lasted one hour An x-ray taken one week after the second procedure showed slight increase in the pulmonary lesions Six weeks after the second bronchoscopy, a third was planned under pentothal-sodium anesthesia However, it was abandoned when the patient coughed severely on induction and developed laryngospasm Three hundred mg of 21/2 per cent pentothal-sodium was used in a five-minute period. Twelve days later an x-ray showed more extension of the previously noted spread Within a month, retrogression of the pulmonary lesions was revealed by x-ray

#### Summary

The preoperative status and the postoperative course of 282 cases with pulmonary tuberculous have been reviewed. No major chest surgery is included in this series.

A brief outline of the classification of pulmonary tuberculosis is included to clarify the terms used. The cases of this series are grouped according to this classification by the findings present at the time of operation. Other factors, namely the presence or absence of positive sputum, the presence or absence of collapse therapy, the pathologic type of disease, the race, and the sex of the patient, also are investigated. The incidence of spread of the pulmonary disease in the immediate postoperative period in relation to these factors is reported.

The cases were grouped according to the type of anesthesia used, and the incidence of spread for each type is noted. Under inhalation anesthesia the type of agent as well as the use of endotracheal intubation are considered. Other factors examined are the duration of anesthesia and the anatomic region of operative site.

Brief summaries of the 24 patients who showed spread of the pulmonary tuberculosis in the immediate postoperative period are included

- 1 In the entire series of 282 cases, there were 31 that showed extension of the pulmonary tuberculosis in the postoperative period as determined by radiographic means. This is an incidence of 10 9 per cent spread.
- 2 No spread occurred in any of the 74 cases with arrested or apparently arrested pulmonary tuberculosis
- 3 The 31 cases that showed extension of pulmonary tuberculosis were found to have received various forms of anesthesia, including spinal, regional, inhalation, and intravenous. No particular technic or agent was apparently predominant in the production of dissemination of the disease
- 4 It would appear that patients who come to operation with positive sputum, regardless of form of anesthesia administered, are more hable to have a postoperative extension than those who come with a negative sputum
- 5 In the group of patients studied, the presence of any form of collapse therapy in existence at the time of operation seemed to afford a certain amount of protection against post-operative spread
- 6 The incidence of spread in negro patients is almost twice that found in the white patients of this series. Also, it has been observed that the spreads found in the negro group were more extensive and of a more malignant character.
- 7 Distribution of cases and the incidence of spread are equally divided between the sexes
- 8 Site and duration of operation in this series apparently bears little relationship to the incidence of extension of the pulmonary disease postoperatively

We feel that, although this series of cases is too small to draw accurate conclusions, it will serve to aid the anesthetist to evaluate better the operative risk of the patient

#### Discussion

Dr Edward R Loftus.—It has been demonstrated repeatedly that the patient with firmly healed pulmonary lesions is a no poorer operative risk, from the standpoint of reactivation of his tuberculosis, than the individual with evidence of pulmonary scars, who never had manifest signs of the disease

This fact, which is overlooked so often, is again shown in this study in which no case of arrested disease showed evidence of extension. The group which did show extension is so small that accurate conclusions cannot be drawn. More important, perhaps, is the relatively larger number of patients in all stages of active disease who did not spread after all types of anesthesia and surgery.

To analyze the 31 instances in which extension occurred and the cause for their desemination is difficult. The difficulty lies in the inability to divorce the effects, if any, of the anesthesia from those

of the surgery In a general sense, the analysis of the cause of tuberculous extension is dependent upon many closely albed and intermingled factors. In this series each case was classified on the basis of clinical evaluation at the time of surgery as well as by the pathologic type of disease present. This latter method is of the utmost value for the prognosis is in a large part dependent upon the extent and type of disease present. Exudative disease is the soft pneumonic type of lesion. It is the acute or recent infiltration against which natural resistance has not or cannot react by the formation of fibrosis. The progression of exudative disease is of more serious import than in other types. I do not infer that these soft lesions invariably progress to a confluent overwhelming pneumonia, for the natural reastance at any time may reach the point where the process is reversed and the lesion absorbed or the process of healing by fibrosis occurs.

However massive exudative disseminations are most typical of the disease as seen in negroes and the prognosis in these instances, in general, is poor

A combined type of lesion, constituting over 50 per cent, was the most common one found in this series. Exudative-productive disease in which soft areas of disease with coexisting tendency to healing constitutes the large proportion of all cases of pulmonary tuberculosis. Although it was found that 12.3 per cent of these cases showed extension, it is safe to say that in most instances this process was reversible in contrast to the 20 7 per cent of cases of exudative disease from which most cases expired. Chronic productive disease is characterized primarily by extensive fibrosis and in these instances, though extension occurred, the ultimate prognous as to life was good.

Extension was seen to have occurred with all types of anosthetic agents and was not proportionately predominant in any one type. Ether anesthesias were followed by 25 per cent extension, but to attempt to draw conclusions on 8 cases is impossible. It does appear, however that the mechanism of spread is dependent upon other factors to which the anesthetic administration contributes only second arily Far advanced and moderately advanced discase constituted over 80 per cent of the entire series. In these instances additional pathologic processes may be acting. Cavitary disease is one of the most important of these.

Large numbers of organisms present in these excavations serve to seed remaining lung tissue when optimum conditions exist. In the absence of adequate preoperative drainage, such seeding is a constant threat.

The presence of collapse therapy seems to afford some slight but significant protection to the patient. The value of collapse would appear to be in the closure of cavitation with decrease in quantity of sputum and the number of organisms, thus avoiding the pooling of this infected sputum in undeseased portions of the lung.

Extension is, in part, dependent upon these factors presented. Alterations in physiology induced by anesthesis allow their action not by direct action. but rather by proventing the usual elimination of infected material.

Avoidance of the general conditions mentioned should aid in preventing postoperative dissemination of pulmonary disease. It seems logical that ad herence to the following points would prove useful

- Preoperative postural drainage by the patient or bronchoscopic aspiration particularly in the presence of cavitary disease
- 2. Placing the patient in a position which will prevent gravitational drainage to the less diseased lung during surgery
- 3 Frequent aspiration of traches to remove this material
- Smooth induction and rapid recovery of cough reflex, with postoperative bronchoscopy if necessary to remove tenacious secretions
- The avoidance of 'overnse of analysis postoperatively that decrease the cough reflex or raise the threshold of the reflex

#### LACK OF VITAMIN A FOUND RELATED TO TUBERCULOSIS

A relation between lack of vitamin A and susceptibility to tuberculous, at least in rate and mice has been discovered by Drs. A. B McCoord, C. P katsampes, E. Day and S W Clausen of the University of Rochester School of Medicine.

The stores of this vitamin in the tissues of mice are lowered by inhalation tuberculosis, the doctors reported at the meeting in Atlantic City of the Amer ican Academy of Tuberculosis Physicians.

Rats that do not get enough vitamin A, they also found are more susceptible to disease than rats with high stores of the vitamin.

Animals lacking vitamin A have brouch that are

broader and more irregular in outline than those of animals not lacking the vitamin and evidences of pneumonia and bronchitis with inflammation are more evident.

-Science News Letter, June 21 1947

## DIFFICULTIES IN THE DIAGNOSIS AND TREATMENT OF LESIONS OF THE PYLORIC ANTRUM\*

HARRY L SEGAL, M.D., JAMES S. WATSON, JR., M.D., and Theodore B. Steinhausen, M.D., Rochester, New York

(From the Departments of Medicine and Roentgenology, the University of Rochester, School of Medicine and Dentistry)

THE importance of early diagnosis of carcinoma of the stomach makes necessary the careful evaluation of any changes occurring in The cause of these varithe pyloric antrum ations may be difficult to determine by x-ray, gastroscopic, laboratory, and clinical study, and its incorrect interpretation can lead to errors in the application of correct therapy This paper, using illustrative cases, outlines the difficulties of diagnosis, re-emphasizes the importance of careful evaluation of the results of the above diagnostic procedures, and stresses especially the thorough follow-up of suspicious cases If these methods fail to rule out the possibility of malignancy, then surgery is indicated even as a further diagnostic procedure

The pyloric antrum is considered as that part of the stomach extending from the angulus through the pylorus. Conditions in this region which may produce subjective symptoms, or objective signs, or both, may be due to one or more of the following variations. (1) normal change in size of the rugae, (2) pylorospasm, (3) gastritis, (4) benign pyloric hypertrophy, (5) gastric ulcer, (6) carcinoma, (7) benign tumors, (8) lymphosarcoma, (9) syphilis, and (10) tuberculosis.

For practical purposes the differential diagnosis usually lies between carcinoma, benign ulcer, and such benign lesions as antral gastritis and pylorospasin. That difficulties have been encountered by others is attested by the many papers that have been written on this subject 1-3

Prior to the use of the gastroscope, Camp¹ and Kirklin⁵ were among the first to emphasize the importance of careful \ray examination, especially compression technic to outline the antral mucosa. Somewhat later Golden⁵ stressed the importance of normal progression of peristaltic waves through the antrum (antral systole). With the advent of the use of the flexible gastroscope in 1932 Schindler, Moersch, and others definitely showed that the direct visualization of the gastric mucosa adds to the ability to make better differential diagnoses of these gastric lesions.

Bockus, Pollard and Cooper, 10 and Vaughn 11

Presented at the 141st Annual Meeting of the Medical Society of the State of New York, Buffalo, Section on Gastroenterology and Proctology, Wednesday, May 7, 1947 \* Supported by a Special Gastrontestinal Research Fund stomach may have similar symptoms and physical signs. This throws the burden of differential diagnosis on the laboratory, x-ray, and gastroscopy, each of which may give inconclusive findings on any single examination. Thus repeat studies are essential in arriving at a correct diagnosis.

Vaughn<sup>11</sup> and Schindler<sup>7</sup> also stress the pertinent fact contrary to the opinion of many

portant point that different diseases of the

They each emphasized the im-

Vaughn<sup>11</sup> and Schindler<sup>7</sup> also stress the pertinent fact contrary to the opinion of many that in well-trained hands a gastroscopic examination is not so formidable as commonly thought

#### Case Reports

this subject

The 9 cases reported are divided under 3 headings

1 Changes Due to Carcinona of the Pyloric Antrum

Case 1—A married man, aged 56, entered Strong Memorial Hospital on February 9, 1943. He presented symptoms of crampy pains in the right upper quadrant which had begun six months ago. Temporary relief had been attained on a medical regimen. Appetite was now poor and the patient had lost 10 pounds.

The laboratory findings of blood, Wassermann, urine, and stools were all negative Gastric analysis showed no free hydrochloric acid after histamine X-ray findings on July 21, 1942, showed clongation of the pylorus This was not observed fluoroscopically (Fig. 1) It was regarded as suspicious and a recheck was suggested

On August 17, 1942, similar findings were present and interpreted as possibly due to adhesions since a cholecystectomy had been done, but recheck was suggested again. On February 11, 1943, the deformity noted in the pyloric antrum had increased in size and a definite diagnosis of carcinoma of pyloric antrum was made (Fig. 2)

In the gastroscopic findings on February 5, 1943, the antrum appeared narrow and its mucosa was thickened, coarse, and granular. The angulus was rigid. The gastroscopic impression was gastritis although a carcinoma could not be ruled out.

Operative finding of the patient operated upon on February 16, 1943, revealed constricting carcinoms of the pylonic antrum. Metastases were present in the omentum and in the jejunal mesentery. A subtotal gastrectomy was performed by Dr. W. J. Merle Scott.

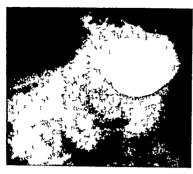

Fig 1 July 21 1942. Elongation of the pylorus not observed fluoroscopically

The microscopic findings revealed wildly growing groups of epithelial cells with irregular alveolar arrangements infiltrated deeply into the muscularis mucosa.

Comment —This case shows the importance of repeated x my examination and the necessity of operating on a lesion of the pyloric antrum which demonstrates progressive changes. It emphasizes that a normal blood count without knowledge of the blood volume may be misleading, and that the absence of occult blood in the stool does not rule out malignancy. The absence of free hydrochloric acid helps to verify a malignant lesion.

Case 2—A married man, aged 62 entered the Strong Memorial Hospital on August 27 1946

Fig 2. February 11 1943. Deformity in pyloric antrum now diagnosed as carcinoma of pyloric antrum.

Fullness and pressure in the opigastrium immediately after meals with flatulence were first noted two years before A gastrointestinal series at that time showed a suspicious area in the pyloric antrum which disappeared on a medical rogumen. His symptoms perasted. A loss of 14 pounds occurred and his appoints became poor Patient sought further medical optinon about a month before admission because his pain had become continuous.

The laboratory findings of the blood showed a mild, secondary anemia. Wassermann urine and stools were negative. Gastrie analysis revealed no free hydrochloric acid after histamine and alcohol A gastrointestinal sories done on August 30–1946 showed an ulcer of the pylorus with irregular appear ance of propyloric mucesa. Recheck was recommended because of the location of the ulcer. On September 10–1946 a repeat gastrointestinal series demonstrated narrowing and irregularity of prepyloric region which persisted after sodium amytal. The x ray diagnosis was carcinoma of pyloric antrum.

An operation done on September 29 1946 revealed a mass the size of an orange in the stomach. This had extended so that it involved the transverse colon A subtotal gastrectomy with posterior jojun ostomy was porformed by Dr. Herman Pearse

The microscopic slides showed carcinoms of the stomach with metastases to regional lymph nodes.

Follow-up — The patient developed a postopera tive pneumonia and died October 11 1946. Per mission for autopsy was refused.

Comment—Two years before the present hospital admission this patient was considered not to have a carcinoma morely because the second gastroin testinal series did not confirm the first x ray im pression of carcinoma. This points out that amy single gastrointestinal series does not alliminate the possibility of carcinoma and that x ray examinations should be repeated in all patients with persistent symptoms in spite of any single negative gastrointestinal series. This case again demonstrates that the absence of occult blood does not rule out carcinoma of the stomach and the absence of free hydrochloric acid after histamine should make one suspicious of carcinoma.

II Changes Due to Antral Gastrilis or Abnormal Rugae

Case 5—A man widower aged 61 was first seen in a private office on March 1041 Symptoms consisted of gnawing pam in the upper abdomen occurring two hours after meals and awakening patient at night Patient's symptoms recurred in April, 1046 at which time relief was gained by food and soda

Laboratory findings of the blood Wassermann, urine and stools were all negative Gastric analysis revealed free hydrochloric acid.

A gustrointestinal series was done on April 2, 1941 and demonstrated a narrowed pyloric antrum with large buarre rugal folds (Fig 3). Peristalsis appeared normal. The oral cholecystogram failed to show the gallbladder. On September 21 1046 a gattrointestinal series showed the same mucesal

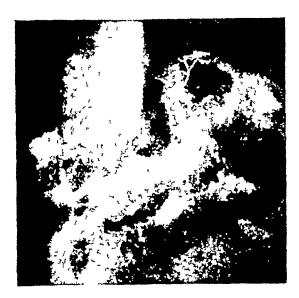

Fig 3 April 3, 1941 Pyloric antrum narrow, large bizarre rugal folds

pattern which persisted after the use of 0.4 Gm sodium amytal by mouth (Fig. 4)

Follow-up — The patient was last seen on March 25, 1947, at which time he was symptom free on a medical regimen

Comment.—This patient demonstrates giant rugae and antral narrowing which has remained constant for six years. The ulcer-like symptoms probably have resulted from the occurrence of superficial erosions. The persistence of x-ray change after sodium amytal suggests an hypertrophic or infiltrative lesion rather than spasm.

Gastroscopy was refused The presence of free hydrochloric acid, x-ray changes which did not progress during a period of six years, and disappearance of symptoms on medical regimens allow the continuation of further medical care This patient should be followed at regular intervals

Case 4 —A single man, veteran, aged 29, was first seen in a private office in August, 1946. For one year he had noted a lump-like feeling in his epigastrium five to ten minutes after meals which also awakened him at night. This symptom was relieved by milk or vomiting. His appetite was poor and he had lost 16 pounds.

The laboratory findings of the blood, Wassermann, urine, and stools were all negative Gastric analysis showed free hydrochloric acid after alcohol. An oral cholecystogram was negative. On August 31, 1946, a gastrointestinal series showed a narrow pyloric antrum with an irregular greater curvature probably due to abnormal rugal pattern. On September 10, 1946, a repeat gastrointestinal series after 0.4 Gm. sodium amytal by mouth demonstrated no change. On January 10, 1947, a gastrointestinal series, done at the Genesee Hospital, revealed the same findings

Gastroscopic findings consisted of large, edematous granular folds Impression was hypertrophic gastritis

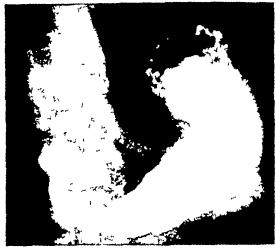

Fig 4 September 21, 1946 Coarse mucosa pattern which persisted after 0.4 Gm sodium amytal by mouth.

Follow-up—On March 4, 1947, there was definite improvement in symptoms on a medical regimen

Comment.—This case represents a patient with symptoms simulating peptic ulcer whose gastro-intestinal series showed bizzare giant rugal pattern. No change in the pattern occurred after sodium amytal. This points to a hypertrophic gastritis, or an infiltrative lesion, rather than spasm. The failure of progression, the presence of free hydrochloric acid, and the disappearance of symptoms all favor a diagnosis of a benign lesion. Follow-up, however, must be continued.

Case 5—A married man, aged 54, entered Strong Memorial Hospital July 8, 1945 Episodes of gnawing pains in the epigastrium relieved by food and powders had been present over a period of six years. The laboratory findings of blood, Wassermann, urine, and stool were all negative. Gastric analysis showed free hydrochloric acid after alcohol.

On July 10, 1945, an oral cholecystogram revealed normal concentration of the dye On July 11, 1945, a gastrointestinal series showed slight narrowing and irregularity of the pyloric antrum. The duodenum was negative. On November 23, 1945, coarse rugae were demonstrated again in the distal antrum. On February 16, 1946, the gastrointestinal series was repeated and showed the same pattern.

Gastroscopic findings of the pylorus were negative Antral waves were present. The antral mucosa was reddish brown and showed increased high lights. Impression was mild antral gastritis.

Follow-up—The patient's symptoms disappeared on usual medical regimen. On March, 1947, he was still symptom free

Comment —A long history, presence of free hydrochloric acid, gastroscopic findings, and lack of progressive changes in the repeated gastrointestinal series point to an absence of a malignant process. The follow-up in this case is adequate and should be continued.

Case 6—A man widower aged 63 was admitted to Rochester Municipal Hospital May 2 1044 He gave a ten year history of episodes of epigastric pain two hours after meals, relieved by food Two at tacks of massive gastrointestinal hemorrhage had occurred. Exploration for the above symptoms in 1030 at another hospital revealed no lesion in stomach or duodenum

The laboratory findings of the blood showed a mild, secondary anemia. The Wassermann and urine were negative Stools were four plus guaiar, and a gastric analysis revealed free hydrochloric acid.

N-ray findings on May 22 1944 showed suspicious narrowing and Irregularity of the pyloric antrum (Fig. 5) On June 8 1944 the pyloric antrum was still narrow and Irregular On January 9 1945 the pyloric antrum was floxible and it was interpreted as benign. On September 10 1946 a narrowed pyloricantrum, which relaxed slightly after sodium amytal was demonstrated (Fig. 6)

Fig. 5 May 22 1944 Suspicious narrowing and irregularity of pyloric antrum

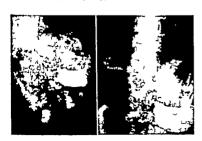

Fig 6 September 16, 1946 Narrowed pyloric antrum relaxed slightly after sodium amytal.

The gastroscopic findings on June 23 1944 demonstrated normal penstalsis in the antrum The pylorus was visualized and normal. A small ulcer with a white base was present in the lesser curva ture region of the antrum. On February 9 1945 the gastroscopic examination was repeated and the nucera was dull rod in color. No ulcer was seen The impression was chronic gastritis. The follow up on March 21 1947 revealed no symptoms to be present.

\*Comment —It is hazardous to pursue a medical regimen in this type of case The justification for continuous medical regimen was the evaluation of the previous negative exploration, the negative gastroscopic examinations, and the relaxation of the antrum after oral sodium amytal Close observation must be continued and, if ulcer symptoms recur this patient should have a subtotal gastrostomy

III Miscellaneous Lesions of Pyloric Antrum
(a) Pylorospasm

Case 7—A man, aged 52 entered the Rochester Municipal Hospital on August 12 1946 complaining of intermittent nausea, womting, and a burning prigastric pain which began after separation from his wife nine years ago. The pain and vomiting had increased during the six months prior to admission. Repeated gastrointestinal series had been done because of a sundicious leagon in the pylorus.

The laboratory findings of the blood, Wassermann and urine were negative Stools were one plus guaiac. Gastric analysis showed free hydrochloric acid. The x ray findings on June 25 1946 showed a persistent prepyloric narrowing, considered probably malignant although one film was apparently nor mal. (Figs 7 and 8) On December 17 1946 a gastrointestinal series still rovenled the prepyloric narrowing After administration of 0.4 Gm sodium amytal by mouth the stomach appeared normal

The gastroscopic finding on June 28 1946 visual-

F10 7 June 25, 1946. Persistent prepyloric nar rowing considered as probably malignant.

Fig 8 June 25, 1946 Apparently normal propyloric region

ized an atrophic gastritis with erosions. The operative finding on August 16, 1946, of the patient, who was explored by Dr Richard Woodruff, was an edematous gastritis. A congenital band appeared to extend from the cecal region to the duodenum A questionable old scar of a healed ulcer in the pyloric region was present. The congenital band was freed.

Follow-up —On April 1, 1947, the patient's domestic situation had improved, and he had practically no gastrointestinal symptoms

Comment—This case represents a pylorospasm on a psychogenic basis. An operation had been performed because of a persistent defect in many of the gastrointestinal series. The proper evaluation of the gastroscopic findings and the disappearance of spasm after sodium amytal might have avoided surgery. The cessation of spasm after sodium amytal points to its cause on a psychogenic basis.

Case 8 —A married man, aged 50, entered Strong Memorial Hospital on June 26, 1935, for symptoms simulating peptic ulcer with obstruction He was admitted again on August 29, 1938 An operation The last admission was revealed no pathology on December 28, 1945 Symptoms of peptic ulcer with obstruction had increased (1,000 ml of stomach contents were aspirated) The laboratory findings of the blood, Wassermann, urine, and stool were negative Gastric analysis showed free hydrochloric acid X-ray findings on June 28, 1935, showed prepyloric and duodenal ulcers associated with gastric retention On December 11, 1945, a gastrointestinal series revealed a gastric ulcer on the lesser curvature of the cardiac portion An ulcer in the region of the pylorus with obstruction also was thought to be present (Fig 9)

A benign ulcer crater in the lesser curvature of stomach penetrating into liver was found only after opening the stomach. The pylorus and duodenum were negative. A subtotal gastrectomy was performed. The follow-up on January 10, 1947, revealed that no symptoms were present.

Comment—This patient during his last hospital admission was clinically diagnosed as a benign gastric ulcer with obstruction secondary to a lesion in

Fig. 9 December 11, 1945 Gastrointestinal series interpreted as gastric ulcer on lesser curvature and ulcer in region of pylorus with obstruction

Fig 10 November 5, 1945 Defect in lower antrum suggesting external pressure or polyp

the region of the pylorus This had escaped notice previously even during exploration. It is an example of pylorospasm secondary to a benign intrinsic lesion of the stomach

Case 9 Part I—A single man, aged 64, was seen in private office on October 11, 1945, for recurrent attacks of diarrhea The laboratory findings of the blood, Wassermann, and urine were negative Stool was positive for occult blood and gastric analysis showed free hydrochloric acid

X-ray findings on November 5, 1945, revealed a defect in the lower antrum suggesting external pressure or polyp (Fig 10) From operative findings, on

February 14 1040 the abnormality seen was thought to be either a benign or a very early mallignant lexion. A Bilroth I operation (resection of the an trum, and end to-end anastomosis of stomach to duodenum) was performed. Microscopic examination revealed a submucous nedule of the pyloric portion of the stomach containing ectopic duodenal mucosa and mancreatic tissue.

Part II —Following operation the patient had 3 cpisodes of tarry stools. The diagnosis was mar ginal ulcer Thio x-ray findings of a gastrointestinal series on June 21 1916 showed porsist in narrowing in region of gastroiduodonal anastomosis which might have been infurpreted as narrowing in mid antral region. The laboratory findings of the blood revealed a mild secondary anemia. The Wasser mann and urine were negative. The stool was positive for blood and a gastric analysis showed free hydrochloric acid.

On February 6 1947 adhesions were found about the provious operative site. The adhesions were freed and a vagotomy was performed.

Follow-up —On April 5 1947 uneventful postoperative convaluecence had occurred —Stools were negative for blood and a mild diarrhea was still present

Comment — Surgery was performed upon this patient because a routine gnatrointestinal serior revealed a persistent lesion in pyloric antrum. The diagnosis of pancreatic rest was made only after microscopic section. Following the Bilroth I operation in this nonpeptic ulcer patient a bleeding, mar gunal ulcer developed. Vagotomy to date has prevented a recurrence of the nelena.

#### Discussion

The foregoing cases demonstrate the problems that were encountered in patients with lesions of the pylonic antrum

The first case illustrates an antral lesson demon strated by x-ray, that was followed too long The care of the patient was influenced by clinical improvement and stools were negative for blood This patient, because of the nature of the x ray findings should have had his eastere analysis and gastroscopic examinations sooner Regardless of these procedures this is the type of lesion which may require early surgery even as a diag nostic measure. It is important again to em phasize that a suspicious gastrointestinal series is very significant and should not be disregarded merely because a succeeding gastrointestinal series is reported as negative. The antral region is one of the easiest portions of the stomach to visualize by x-ray, but the most difficult to analyze from the differential diagnostic view point

The findings in the second patient also stress the fact that caremoma of the stomach can grow slowly Kantor<sup>12</sup> and others<sup>13</sup> <sup>14</sup> have reported similar lesions. In both of these patients mere reliance on stools would have been misleading The 4 cases reported here, in which the final diagnosis was antral gastrius or large rugae, required close observation and complete study including gastrontestinal series, gastroscopy (except in the patient who refused), gastro analysis etc., to allow continued medical observation. The viray findings in 2 of these cases simulate abnormal rugae recently reported by Ricketts et al. 13. These patients must be observed carefully to evaluate the proper therapy

Pylorospasm is divided usually into 3 types psychogenic, intrinsic, and reflex. The cases reported here represent the first 2 types, respectively. The psychogenic pylorospasm occurred following emotional stress and persisted in most of the gastrointestinal series taken during the period of symptoms. In our experience such spasm will disappear under the hypnotic action of sodium amytal. This patient could have escaped operation if these points had been considered more carefully.

The intrinsic pylorospasm persisted until the intrinsic lesion was removed. This type of pylorospasm in our experience does not disappear with the usual hypnotic does of sodium amytal but is relieved by deep anesthesia. Unless the surgeon is aware of this possibility and its complications he may not explore the stomach sufficiently to discover the organic lesion.

The change in the x-ray appearance of the py lone antrum due to a pancreatic rest required surgery and microscopic examination to establish the correct diagnosis. It is best to operate on any lesson of the pyloric antrum when there is doubt of its benign nature

#### Summary

Nine cases with gastrointestinal symptoms are reported all of whom had changes of the pylone antrum by x ray. These findings necessitated repeated observations in most cases before a diagnosis was reached. Gastroscopic examination was very useful in differentiating most of these leanons where the area could be visualized adequately. The laboratory findings alone were misleading in some cases and must be evaluated in the light of all other observations. Sodium amytal has been used in several cases in an attempt to differentiate organic from inorganic leaions and seemed to have been of value in separating psychogenic from intrinsic pylorospasm.

Careful analyses and correlation of the clinical, laboratory '-ray and gastroscopic findings, as well as repeated examinations and close follow-up, are necessary to attain a high percentage of correct diagnoses in the type of patients presented in this paper.

#### Discussion

Dr Walter Scott Walls, Buffalo -In the introduction to his paper. Dr Segal said that "the importance of early diagnosis of carcinoma of the stomach makes it necessary to scrutinize carefully every lesion that may deviate from the normal " This, of course, is a statement of prime importance when we consider that even with the very best diagnostic aids. including gastroscopy and x-ray, there is a sizable error in diagnosis in the best of hands Dr Howard Grav. of the Mayo Clinic, reports a 6 per cent error in diagnosis of gastric lesions preoperatively, and further states that at operation the surgeon and pathologist cannot be sure always of the diagnosis of a resected specimen without microscopic sec-We, too, have seen cases where the ultimate diagnosis has been in doubt for several days while the pathologist made almost serial sections of a suspicious ulcer

The burden of preoperative diagnosis falls, of course, on the internist, and unless he feels that his accumulated evidence makes surgery advisable at once, he must be willing to see not only that a lesion heals under his treatment but that it stays healed This will necessitate refor at least two years peated x-ray examinations and also gastroscopic follow-ups, too, if available Failure of a lesion to heal under vigorous medical treatment which should include rest in bed, or a recurrence of an apparently healed lesion, or last, inability to institute a proper regimen of treatment and follow-up, should be regarded as indications for surgical treatment five-year survival rates of postoperative gastric malignancy are so universally poor, that early operation is imperative if we expect to remove the lesion in a state of limited extension. It is well known that

malignant gastric lesions improve paradoxically under a good medical regimen, only to blossom forth anew as the patient and doctor are lulled to a false sense of security This is amply demonstrated by Dr. Segal in his first 2 case reports where the patients had been x-rayed and treated six months and two years, respectively, previous to surgery

Dr Segal discussed pylorospasm due to psychogenic factors and also that due to an intrinsic He mentioned pylorospasm due to reflex causes and in this connection it probably should be mentioned that cholecystic disease, certainly, and appendiceal disease, possibly, are frequent

causes of pylorospasm

There are few lesions in medicine where the diagnostician can less afford to be wrong than in the diagnosis of lesions of the stomach Segal's admonitions of careful and repeated complete studies are timely and well emphasized.

#### PROGRESS IS NOTED IN MEDICAL STUDIES

Grants totaling \$532,000, chiefly for research in medical colleges, universities, and hospitals in the United States and Canada, were made during 1946 by the John and Mary R Markle Foundation, it was announced recently by John M Russell, executive director

The largest grant, \$60,000, went to the Committee for Research in Endocrinology of the National Research Council, the work of which for the last ten years has been supported by the foundation institutions receiving grants and some of the research

projects they will carry included

Columbia University, College of Physicians and Surgeons, \$29,000 for studies in the treatment and prevention of filariasis and of the vitamin E content of human and animal tissues, Cornell University Medical College, \$32,000 for studies of the influenza virus, hypertension and myasthenia gravis, Johns Hopkins University School of Medicine, \$24,000 for research on cholesterol and ocular tuberculosis, Harvard Medical School, \$22,000 for studies of hypertension, hypersensitivity, and altitude sickness, McGill University, \$11,000 for studies of red blood cells during storage and after transfusion, University of Minnesota, \$9,000 for studies of the brain, University of California, \$13,000 for research in tussue metabolism and studies of blood.

Mr Russell pointed out that the attitude of the public toward "slow, deliberate, basic studies in the sciences," is responsible for increased funds for re-

search

"Recognition by the citizen of the importance of basic science has made it possible to support research from funds coming directly or indirectly out of his pocket," he said "Agencies which collect funds from the public to combat a single disease and which once thought they could take only palliative measures now are spending a great deal of money to strike at the very root of the problem Public funds in unprecedented amounts are being allocated to institutions for medical research, both public and private"

#### ANAL INCONTINENCE

STUART T Ross M D Hempstead, New York

A LTHOUGH actual cases of rectal incontinuous nence are few, the profound nature of the social consequences to the patient warrants the careful consideration of the profession toward this condition. Rare indeed is a nonfatal, non crippling disease which can ruin a life as effectively as a true incontinence of feees.

#### Etiology

Broadly speaking, causes of meontinence may be divided into (1) trauma to the local musculature meduding surgical trauma, (2) disturbances of in nervation, and (3) congenital malformations

Clinically, however the eurology of the great majority of cases of incontinence falls into one or the other of the following specific categories

- 1 Incontinence following operation for fistula (Case 1)
- 2 Incontinence following a third degree tear during partirition (Case 2)
  - 3 Tabes dorsalis
  - 4 Injuries to the spinal cord

A smaller number of cases are found following

- 1 Overstretching of the sphincter at operation (Case 3)
  - 2 Sodomy
- 3 Direct trauma, i.e. impalement or war wounds

#### Prophylaxis

As as well known, continence of feces depends upon the integrity and adequate functioning of the external sphincter of the anus plus the puborectalls portion of the levator ani The internal sphincter is merely a terminal thickening of the inner circular smooth muscle coat of the rectum and is of little importance in the maintenance of control. Prophylaxis of incontinence consists in efforts to preserve the physical integrity of the external sphincter and a functioning nerve supply To the obstetrician this means an avoid ance of third degree tears and their prompt repair when these occur To the anorectal surgeon it means abandoning the practice of forcible divul sion of the sphincters—a brutal, dangerous and unnecessary maneuver Furthermore during fistula surgery, the following rules for sphineterotomy should be observed

1 The sphincter should be cut in one place only The dangers of multiple incisions at one sitting should be obvious.

2 Sphincterotomy should be performed in the midline posteriorly if possible. This is for several reasons.

CHAIL LOSTSOTTS

(a) The greatest thickness of muscle is here(b) The superficial portion of the external

sphincter will be separated and not cut by such an incision

3 The subcutaneous external sphineter alone may be severed with impunity

4 If necessary, the greater part of the external spluneter may be severed, provided that enough muscle is left to act as a splint for the remainder

5 Muscle ends should not be packed apart. The natural tendency will be to heal with a short block of scar tissue between sphineter ends, but if these ends are held apart for a number of days by packing the resultant large creatrix will prevent their near apposition, and incontinence of some decree may result.

If it is found necessary to divide the entire anorectal ring, it may be done with a two-stage seton technic. The sphincter is divided from the inside part way toward the anal verge, and the remaining muscle, composed of the subcutaneous and part of the superficial muscles is surrounded by a loose heature of heavy black silk called a seton. When the operative wound has healed down to the seton, it may be removed by incising the remaining sphincter thus completing the sphineterotomy This technic utilizes the superficial parts of the sphincter as a splint for the severed deep parts when the latter are healed, they in turn serve as splints for the severed superficial parts

Case 1—R. G., a white man of 42 was admitted to the hospital with a diagnosis of abscess above the levator ani on the left (left pelvirectal abscess). He was treated conservatively for two days, becoming more and more toxic, and on the third day incision and drainage were done. Culture of the pus revealed Bacillus coli.

Seven months later this patient was operated a tract was found extending from the posterior anal commissure around the left side of the anus, crossing the midline anteriorly and into the right ischioanal space. The tracts were incised down to the internal opening, which necessitated severing the external sphincter. The wound was packed with

Presented at the 141st Annual Meeting of the Medical Society of the State of New York, Buffalo Section on Gastroenterology and Proctology Thursday May 5, 1947

iodoform gauze packing" The wound remained packed open for nine days, being repacked 5 times in that period

Five weeks later the patient was readmitted with a complaint of partial incontinence ever since the operation for fistula. Gas and a small amount of stool frequently escaped without the patient's volution A fistulous tract was still present Some weeks later a Devine type colostomy was done, and two months after this a perineal dissection was undertaken, during which scar tissue was excised and "dead space resulting from excision of scar tissue obliterated by interrupted silk sutures except for a pocket in the posterior midline which was packed" Two days postoperatively the packing was removed and the pocket repacked This procedure was repeated daily for two weeks

Of the many aspects of this case, two deserve particular mention First, the two-day delay in the hospital before the initial incision and dramage of the abscess undoubtedly permitted the abscess cavity and the subsequent fistula to increase in size Second, the assiduous packing and repacking of the fistulous wound was inadvisable

#### Diagnosis and Examination

The diagnosis of incontinence per se could hardly be mistaken However, the determination of the etiology and of the immediate status of the sphincteric mechanism is important to the planning of a corrective procedure

With incontinence following fistulectomy, the resulting scar will point infallibly to the general location of the muscular defect Careful palpation with one finger in the anus and the thumb at the verge will usually then disclose the location of the intact portion of the muscle

In complete obstetric tears of the anterior quadrant, the ends of the retracted muscle may be indicated by slight skin dimples—the so-called "sphincter pits" Palpation as described above will locate the intact portion of the muscle

In incontinence resulting from forcible divulsion, the sphincter will be intact and palpable throughout, but its contractile excursion will be insufficient to close the aperture effectively. This is illustrated in Case 3

In incontinence resulting from tabes or other neurologic conditions such as cord tumor or traumatic transection of the cord, the anus will gape when lateral traction is applied to the edges

#### Treatment and Case Reports

The treatment of anal incontinence is opera-Several satisfactory technics—some new, some old-are available for use in the various conditions as found clinically

The oldest procedure and the simplest in concept consists merely in dissecting out and removing the scar tissue from between the several sphincter ends and suturing these ends together

While from a theoretical standpoint this may be sound, there are technical difficulties inherent in any attempt to do accurate dissection in cicatricial tissue Moreover, the sphincter ends when freed invariably will be found to be difficult to pull together and will not hold well when sutured under tension Nevertheless, the procedure is useful in a few cases, provided scar tissue is not removed from the torn ends. More mention will be made of this point later Case 1 represents an example of this type of operation

Cases of incontinence due to obstetric trauma and accompanied by laceration of the rectovaginal septum are probably best treated by turning down a vaginal flap and suturing the spluncter ends anterior to it, a procedure modified from Farrar's technic 1 This may be illustrated by the following case

Case 2—S W, a white woman of 29, was first seen in April, 1942 Ten days previously the patient had been delivered of her first baby following an extremely difficult seventy-two hour labor with a right mediolateral episiotomy and forceps. The episiotomy extended through to the rectum mediate repair was done using chromic catgut and closure was apparently firm up to the seventh postpartum day, when an oil enema was given followed by a low soapsuds encina That night fices were passed through the vagina

Examination revealed the episiotomy to be completely broken down except for a one-quarter inch bridge of skin at the fourchette. The external sphincter was completely severed just to the right of the anterior midline. The walls of the wound were soiled with stool and lined with granulation tissue A delay of several weeks was recommended to permit the patient to recover from her strenuous delivery During this time, measures were taken to decrease the infection and, are weeks later, the folfowing note was made on the office chart

"Examination reveals the present status to be as With a finger inserted in the anus, no constriction whatever is felt when the patient is asked to contract the sphincter The external sphincter muscle is palpable throughout the entire extent of the anus except for one-half inch, anter-At this point, rectal mucous membrane ends in scar tissue which is joined directly to the vaginal mucous membrane A bridge of tissue, oncquarter inch thick, remains, marking the original position of the fourthette Between this and the anterior aspect of the rectum as it joins the vagina is a circular defect 1 cm in diameter"

At operation, the bridge of tissue was severed The posterior end of each labium minus was sutured to the medial surface of the corresponding thigh, thus furnishing automatic traction. An incision was made on either side from the lateral edge of the rectovaginal septum upward for one inch, and the upper ends of the 2 incisions were joined across the posterior wall of the vagina The flap of vaginal mucosa thus outlined was dissected free and turned

down Each lateral incision was extended posteriorly and the scar tiesue over the sphineter ends freed for one-half inch and sutured togother anterior to the reflected vaginal flap with number 0 chromic catgut. The puborectales were approximated across the midline. Wounds were loosely closed and small rubbor tiesue drains left at the apex of the vaginal wound

The right wound healed by first intention but the left wound opened somewhat and healed by granulation Following this procedure, the patient lost a small amount of gas occasionally but otherwise control was good.

For patients whose splineters have been over stretched and for those whose incontinence is the result of a small amount of sear tissue between muscle ends, a plication or recting operation is most satisfactory. This is most conveniently done in the anterior quadrant.

Case S—D L. a white man of 74 a clergyman twenty five years previously had been subjected to hemorrhoidectomy Since this operation he had been afflicted with incontinence for liquid stools and gas but could retain solid stools faurly well. Five years following the hemorrhoidectomy the patient noticed a gradual onset of diarrhea and from that time on had an average of 4 stools daily all of them liquid except for an initial plug of solid stool in the morning. There had been no change of this lower habit for two years. There were no further symptoms, but the more or less constant dribbling of liquid stool played profound havec with the patient shife.

At examination, there was noted considerable laxity of the external sphineter the anorectal line being easily brought into view by lateral traction on the buttocks. Palpation revealed a hypotonic sphineter with no apparent loss of continuity Upon request the patient could contract the sphine ter but the contractile excursion was insufficient to close completely the anal aperture. Liquid stool lined the walls of the rectum.

Hydrochloric acid by mouth cleared up the diarrhea, and after a suitable workup considering his age the patient was operated upon. A semi-circular incision was made encirciling the anterior half of the anus one linch from the anal verge. The skin flap thus outlined was dissected up and drawn back over the anus, exposing the anterior portion of the aphanoter With the assistant's hitle finger in the anal canal 3 interrupted number one chromic catgut sutures were placed transversely uniting the right and left portions of the muscle so that the finger fitted snugly but not tightly into the canal. The akin flap was sutured back in place with interrupted silk. The results of this simple procedure were excellent, including good control of gas.

In addition to the above methods we are in debted to Blaudell's for the following procedure useful for cases presenting large defects of the sphincter with the remaining muscle markedly

contracted The location and extent of the remaining sphineter is ascertained by palpation by finding the dimples marking the aphineter ends and by observing the contour and wrinkling of the aperture A semicircular incision is made about the site of each muscle end and deepened From the convexity of each incision a one to two em longitudinal incision then is made parallel to the and verge and deepened to the same depth No attempt is made to dissect out the muscle Each block of tissue containing a muscle end is then sutured to the further end of the longitudinal incision thus advancing it for a distance equal to the length of the incision Deep sutures are inserted to avert wound tension. This constitutes the first stage of the operation and serves to elongate the contracted muscle and to bring its ends nearer together. At the second stage, after firm healing, a circumfer ential curved incision is made from one of the previously formed scars to the other-that is. from one muscle end to the other The 2 ends of the incision are then approximated, thus bringing the muscle ends again into near approximation, and at the same time forcing a fold of tissue toward the anal aperture itself thus filling some of the gap Although this procedure leaves a scarred and nuckered anus its functional results should be good and it has the further ad vantage of comparative simplicity

vantage of comparative simplicity
Numcrous other operative procedures have
been advised for the relief of incontanence. Most
of these attempt to construct a substitute splineter from strips of fascia lata or nearby muscles.
The usefulness of such operations is limited
sharply by the fact that they necessitate retraining the patient to contract relundarily his
glutei adductor magnus, or whatever muscle
has been utilized. In other words, continence
following these operations will be to some extent
under the control of the will but will definitely
not be foolproof and will require alertness.

In hopeless cases of complete absence of sphincter or transections of the spinal cord, the patient should be treated as though an abdominal colostomy were present—i e. with a constipating diet and daily enemas or prigations

Several principles of operation will bear empliasis.

- It is well to make no attempt to dissect sear tissue caps completely away from torn
   muscle ends. These caps are firmly attached to the muscle and serve to hold sutures with out strangulating.
  - 2 When the sphineter muscle is contracted and thickened it should be united in stages thus permitting it to lengthen between stages without the disastrous results of suturing under excessive tension

- 3 Steel alloy suture material has several advantages, among which are its failure to irritate tissues and its holding qualities in a contaminated wound. I am convinced that the recovery of Case No. 2 would have been facilitated by the employment of steel instead of catgut.
- 4 It is not always necessary to remove a short block of scar tissue—narrowing the muscular ring is simpler and will often serve as well

# Summary

- 1 Common causes of anal incontinence are enumerated
- 2 Principles for avoiding incontinence in fistula surgery are discussed
- 3 Methods of operative therapy are described
  - 4 Illustrative cases are presented

### Discussion

R. V Gorsch, M D, New Yorl —Dr Ross has presented the subject of anal incontinence primarily from the proctologic standpoint, emphasizing the prophylactic measures in fistula surgery and the more recent methods of sphincter repair

Fistulectomy, incisional drainage of anorectal abscess, and hemorrhoid operations are accountable for roughly 60 per cent of the cases of anorectal incontinence. The vast majority of these cases are avoidable and the following remarks are directed primarily to this phase of the subject.

Repeated fistulectomies or fistulotomies result in anorectal incontinence because division of the sphincter musculature is commonly done without sufficient regard to the anatomic divisions of the muscle and its functional capacity in its various quadrants, particularly the anterior in the female Furthermore, division of the sphinoter muscles is commonly made on an incomplete conception of the fistula pathology-namely, missing the original pathologic internal opening This is perhaps the commonest cause for recurrence The proctologist and the general surgeon are repeatedly confronted with the problem of demonstrating the internal opening of fistula, and in a considerable number of cases repeated attempts, despite the methods used, injection, probing, x-ray, etc, fail to reveal any connection with the bowel The anticipated disclosure of the internal opening during operation frequently enough is disappointing, and the common practice of puncturing the bowel wall and dividing the intervening musculature at the probable site of the internal opening is an uncertain procedure We strongly question the advisability of incising the sphincters at any level or making drainage incisions with the idea of shortening fistulous tracts. or with the hope that "nature" will take care of the internal opening The increasing difficulties confronting subsequent operators, both in the ultimate cure of fistulas and the successful repair of incontinent sphincters following successive recurrences scarcely need be mentioned

Successful surgery of anorectal fistulas depends essentially on the accurate determination and actual demonstration of the entire fistulous tract and its internal opening in relation to the anorectal muscle ring. When these criteria are fulfilled the surgery is usually successful.

In the tuberculous fistulas and those secondary to the chrome collides and regional ileitis, these considerations are of greater significance. In this regard perirectal sinuses following suppurative processes which are entirely unrelated to the bowel should, if possible, be carefully differentiated and not treated as anorectal fistulas. Misdirected treatment in these cases usually results in repeated recurrences, chromic invalidism, and incontinence

Drainage of anorectal abscesses has a definite bearing on incontinence. The pathogenesis of anorectal suppuration and fistula formation is still somewhat controversial, but that adequate drainage has not always been done on a basis of accurate localization seems to be substantiated by the recent work of Dr Courtney Incisions of the sphincter musculature in draining anorectal abscesses should therefore be cautiously advised and carned out In selected cases and in expert hands it may perhaps be permissible to include the intramuscular portion of the abscessed tract in the drainage incision, with the expectation of avoiding a subsequent fistula. Injudicious probing may complicate materially the future fistula pathology, and it may be noted in this regard that all anorectal abscesses are not necessarily of cryptic or intramuscular gland origin

Under etiology, the incontinence commonly resulting from procidentia of the rectum should be mentioned. A certain degree of improvement may follow correction of the procidentia but the attenuated anal musculature usually requires operative repair. Multiple plication of the sphincters and levator an muscle with perincorrhaphy in the female would appear to be the method of choice.

Also under etiology, the varying degrees of incontinence following preservation of the sphincters in the abdominoperineal excision of the rectum or sigmoid may be mentioned

In the surgical treatment the author stresses the inherent difficulties of accurate dissection of the anal musculature in scarred tissue, and he presents the technic of the various surgical procedures in detail I desire to stress some of the physiologic factors

Successful repair of the anorectal musculature requires a careful evaluation of several factors. The more important of these include the tone, contractility, and extent of musculature still intact, including the levator ani and their innervation. Most important is the extent of actual or residual infection which is directly related to the capacity of the tissues for successful healing. The approximation of scarred sphincter ends or scar tissue in general produces a closed wound which presents immediate problems of adequate wound nutrition,

tissue mechanics, and "physiologic antisepsis

(Flaming)

Favorable conditions for these assentials of primary wound healing do not exist in the anorestal tissues, particularly in recurrent cases, and tissue disruption with bridging and sinus formation usually follows. These factors account for the poor results in the so-called classic operation of approximating the cut ends of the sphincters. They likewise indicate a definite preference for operative technics which plicate or shorten intact and undamaged portions of the musculature as originally advocated by Dr Blaisdell and described in detail by Dr Ross. In minor degrees of incon tinence, simple excision of scar tissue but without suture, as advocated by Bule, may sometimes be useful and successful. Incontinence with more or less complete destruction of the sphincters requires a special type of operation, usually with fascial transplants of the Wreden-Stone type based on the particular merits of the case.

In selected cases plication and reefing of the levator plate posteriorly and careful approximation of the pubecocoveral legs in the female may be supplementary useful procedures.

Anal incontinence arising on a medical basis is usually not amenable to surgical interference and is therefore only of diagnostic interest to the proctologist.

#### TEACHING DAY TO BE HELD IN MONROE COUNTY

A Teaching Day for the Monroe County Medical Society will be held Thursday, November 13 at the Rochester Academy of Medicine. The morning assign, beginning at 11 00 A.M., will feature lectures by Dr Paul Remikoff professor of clinical medicine at Cornell University Medical College on 'The Diagnosis and Treatment of Anemia,' and by Dr Clarence E. de la Chapelle professor of clinical medicine and associate dean of New York University College of Medicine on 'Management of Acute Cardiovascular Emergenciea.'

The afternoon session, which starts at 2 00 P.M. will have as its speakers Dr George E. Anderson clinical professor of medicine at Long Island College of Medicine, Brooklyn, who will lecture on the sub-ject of 'Diabetes Mellitus, Its Modern Interpreta-tion and Treatment, Dr. Edward J Stieglitz, chief of staff of Suburban Hospital, Bethesda, Maryland, on the subject of 'Health in an Aging Population', and Dr H. McLood Rigguns, associate in medicine at Ballevus Hospital, College of Physicians and Sur geons, Columbia University and medical durector of the Tuberculosis Service at Triboro Hospital, Quoens, who will speak on "Asymptomatic Thoracia Diseases.

This postgraduate instruction is presented as a cooperative endeavor between the New York State Department of Health and the Medical Society of the State of New York.

Health is a state of complete physical, mental, and social well-being, and not merely the absence of disease or infirmity -The Mississippi Doctor June 1947

#### NEW BARBITHRATE REGULATIONS

Effective November 1 1947, the prescribing and dispensing of barbiturates in the City of New York will be governed by the following requirements of the Sanitary Code

Barbiturates may not be dispensed except on

written prescription.

2. A prescription for barbiturates may not be refilled unless there is specified on the prescription the number of times it may be refilled and the mini mum interval that may elapse between refillings.

3 Under no circumstances may a prescription

for barbiturates be refilled later than three months

after the date of usuance.

4. Barbiturates may not be dispensed on a telephone order

5 A copy of a barbiturate prescription cannot be filled only an original is acceptable.

6. Barbiturates, including manufacturers samples dispensed directly to a patient by a physician, must be given in a container on which the follow ing information appears

- (a) Doctor's name and address
- (b) Patient s name and address (c) Directions for use
- (d) Date of dispensing
- Prescriptions written for compounds containing barbiturates are exempt from the provisions of the new law if the compound contains in addition to a barbiturate such a quantity of another drug or drugs as to make the action of the compound not primarily hypnotic or somnifacient and provided no such compound contains more than 1/4 grain of a barbiturate in each dose. In addition prepara-tions used as sprays, gargles or for external applica-tion are also exempt if they contain, in addition to the barbiturate, other ingredients which make the preparation unfit for internal use.

The Department of Health is making every ef fort to acquaint practitioners pharmacists, manu facturers, wholesalers and the general public with the provisions of the Sanitary Code regulating the sale and distribution of barbiturates. If the program is to be successful, the cooperation of every physician practicing in this city is essential.

> ISRAEL WEINSTEIN Соттимопет

should be administered Doubtless it is well to recall the fatal outcome of abdominal surgical procedures during the epidemic mentioned

I can recall one case which illustrates the effect of amebae on an anorectal inflammatory process. A large ischiorectal abscess had developed which was incised and was followed by an extensive fistula in ano. Satisfactory fistulectomy was accomplished but there was no evidence of healing until antiamebic therapy was instituted and continued until the stools were free from the organisms. When this had been accomplished healing proceeded normally and without more deformity than would have occurred had there been no amebic infection at any time.

### Tuberculosis

Tuberculous ulceration or colitis will rarely cause perforation and, in the hyperplastic type, stricture may be produced In the case of a young woman, a stricture developed which caused sufficient obstruction to make colostomy im-The young woman suffered from extensive pulmonary tuberculosis and hence a presumptive diagnosis of tuberculous stricture or stricture of unknown origin was made lesion could not be distinguished grossly from one caused by venereal lymphogranuloma, but postmortem examination proved the diagnosis of tuberculous stricture to be correct Most fistulas in ano will be infected with the tubercle bacillus if there is any tubercular colitis

# Venereal Lymphogranuloma

Venereal lymphogranuloma will often produce persistent proctitis and also stricture. While this is not typically an ulcerative disease of the colon, it seems to belong in this group for study. As the name implies, the disease is infectious and is distributed by venereal contact.

The changes caused by this disease and observed in the rectum, anus, perianal region,

perineum, and labia result from the involvement of the lymphatics. The resulting lymphangitis is accompanied by the formation of excessive fibrous tissue which forms the stricture, accounts for the edema, the perianal tags, and the peculiar sinuses, as well as the elephantiasis of the vulva of some women who have this disease. The stricture observed in the rectum may be ringlike or tubular. It may develop promptly and extend rapidly or it may proceed slowly. The lesions observed may be true fistulas or only sinuses extending into the perianal tissue.

### Factitial Proctitis

Factitial proctitis which results from the application of radium to the cervix may be only superficial telangiectasia or a true ulcer. In the latter case contraction of the lumen of the rectum may occur or in some instances perforation through the base of the ulcer will cause a rectovaginal fistula. The ulcer is chronic and may persist for years

### Comment

In discussing the complications peculiar to ulcerative diseases of the colon I have tried to minimize the discussion of percentages and other details which might prove of interest only to a specialist in this field. These can be obtained from studies such as those compiled by Bargen <sup>4</sup> I have tried to present a subject worthy of consideration by all physicians and surgeons and to discuss it in a manner to insure that the patient may be protected, that the proper diagnosis may be made, and that the too-common pitfalls may be avoided

### THE DEAR PUBLIC

Information clerks sometimes feel a little less sweet than their manner indicates. For example, the clerk at the information desk at Missouri Baptist Hospital, St. Louis, continued to wear her cordial smile after these two encounters.

MRS CALLER How is Mrs James Roberts

today?

CLERK Mrs Roberts' condition this morning is reported good, she had a comfortable night and is getting along very well MRS CALLER Is she wearing her pink night-gown or her blue one?

That was an unusual occurrence The following is a more routine reaction

MRS GUEST I'd like to see Miss Julia K Jones CLERK Miss Jones was discharged as a hospital patient and went home yesterday afternoon

MRS GUEST Oh, ISn't that a shame! Here I've made a long trip out here for nothing!—The Modern Hospital. June. 1947

#### CLINICOPATHOLOGIC CONFERENCES

FOURTH MEDICAL DIVISION OF BELLEVUE HOSPITAL, New York City

Date. December 2, 1946

Conducted by Max Truber, M D

# Chronic Bronchitis with Resulting Pulmonary Fibrosis and Emphysema

Dr. William A. Leff W P, a 50-year-old white man, was admitted to Bellevue Hospital on August 12, 1946 with the chief complaints of generalized weakness and pain in the left chest aggravated by respiration He had been transferred to Bellevue from another hospital where he had been attending its medical clime for the past three years At this clinic it was thought that he had pulmonary fibrosis and emphysema, and that he had had repeated pulmonary in farctions. A hypertension was noted also was under frequent observation at the clinic and was getting along well until a few days prior to this hospital admission when he began to complain of pain in the left chest and abdomen. This caused him to visit the clinic, where he appeared 'strikingly worse" to those having seen him previously Examination at this time revealed a blood pressure of 155/110 and a ventricular rate of 120 with normal sinus rhythm. The chest revealed numerous wheeres but no rales. and his abdomen was slightly but diffusely tender He was referred to Bellevue Hospital with the diagnosis of a possible myocardial infarction.

The past history revealed that the patient had pneumonia following measles at the age of 13 Since that time he had a persistent cough productive of approximately 250 cc. of yellow mu coid sputum daily, which became aggravated during the winter months. At 22 he had an episode of left-sided pleuring and at 23, a partial gastrio resection for a gastric ulces

Four years previous to the present admission he was hospitalized for a second episode of pneumonia. At this time it was thought he had tuberculosis, but sputum concentrates and gastric washings were all negative for acid-fast bacilli. The x ray was interpreted as extreme apical fibrous infiltrations bilaterally "His blood pressure at this time was 135/85 From the time he left the hospital until the present, he suffered frequent coughing spells anterior chest pain and wheezing, progressive dyspnea, intermittent 2-pillow orthopnea, and ankle edema. Anorexia, weakness, and frequent episodes of diarrhea also occurred There was one episode of hema turia two years ago

Physical Examination —On admission the temperature was found to be 100 F pulse,

130, and blood pressure, 160/150 The patient was cachectic and appeared both acutely and chronically ill He was moderately dyspaeic and orthopness. The eyegrounds revealed some blurring of the temporal margins of the disks with slight venous congestion. A one-plus sclerosis and tortuosity of the rotinal vessels was noted The chest expanded equally bilaterally, breath sounds were distant, and numerous wheeses were heard throughout both lung fields There were some medium most rales at the left base. The heart sounds were poor, the rhythm regular, and there was no pulse deficit. The second pul monic sound was accentuated and there were no murmura. The liver was palpable three-finger breadths below the costal margin and there was slight costovertebral angle tenderness bilaterally There were irregular ecchymotic areas over the dorsum of both hands. There was no eyanosis clubbing or peripheral edema

Fluoroscopic examination revealed a mottled infiltration throughout both lung fields with linear streaking toward both apices

Laboratory studies indicated a white cell count of 10 500 with the following differential seg mented forms, 67 per cent stab forms, 11 per cent, eosinophils 1 per cent lymphocytes, 19 per cent, and monocytes, 2 per cent The hemoglobin was 125 Gm, and the platelets, 350 000 Urmalysis showed specific gravity, 1012, albumin, four plus sediment had occa sional red and white blood cells Blood chem istry was nonprotein nitrogen, 33 mg per 100 cc., total protein 50 Gm per cent, albumin 31 globulin, 19 Gm. per cent. Gm per cent Sedimentation rate was 18 mm per hour blood Wassermann reaction was negative. Prothrombin time was normal Electrocardiogram showed sinus tachycardia of 110, left axis deviation, low voltage, occasional premature con tractions, and T waves inverted in leads II and Roentgenogram of the chest revealed ex tensive interstitial changes and fibrous at the roots. Chronic fibrotic infiltrations extending throughout both lungs, especially marked in the lower halves were noted, also a small effusion with thickened pleura at the bases.

Course —A thorncentesis was performed both for diagnostic and therapeutic purposes. Twelve

hundred cc of fluid was obtained from the left It was straw-colored and jelled pleural cavity Smears of the fluid failed to reveal any quickly organisms A culture was reported as Staphylococcus aureus but it was thought to be a con-It was noticed that the fluid reaccumulated rather quickly Two days later a thoracentesis of the right pleural cavity was performed and 300 cc of fluid obtained which showed no organisms on smear He was placed on diuretic therapy with moderate response His general condition, however, failed to improve, and his course continued downhill

Many urnalyses revealed specific gravities ranging from 1 012 to 1 022. Albumin ranged from a trace to four-plus, and there were occasional red and white blood cells and hyaline and white blood cell casts noted at one time or another. Blood counts showed a white cell count ranging from 12,000 to 13,000 with a differential varying little from normal. The hemoglobin level persisted at 11 to 12 Gm. Numerous sputa were all negative for acid-fast organisms. The alkaline phosphatase level was 4.5 Bodansky units, the phosphorus, 4.1 mg. per 100 cc. and 3.01 mg. per 100 cc. on 2 determinations.

Several observers suggested that the clinical symptomatology might be that of a generalized arterial disease and, hence, a muscle biopsy was done. It was reported as "atrophy of striated muscle." Fluid was reaccumulating rapidly and a third thoracentesis was done with results similar to the first two. The patient developed difficulty in voiding and was seen by the urological service. Two strictures of the anterior urethra were noted and a filiform catheter was passed after which profuse bleeding occurred

A repeat electrocardiogram on the tenth day revealed "showers of premature contractions interrupting normal rhythm"

On the twentieth day he had a sudden attack of dyspnea and sharp substernal pain made more severe by coughing. There was no hemoptysis Examination of the chest revealed dullness at both bases with diminished breath sounds and diminished vocal fremitus, wheezing, and prolongation of the expiratory phase Oxygen, aminophylline, and mercupurin provided some degree of relief. On the following day he appeared much improved and an excellent diuresis was obtained. It was thought that the episode had been one of left ventricular failure.

Fluid continued to reaccumulate on the left side and the purpuric-like lesions on the dorsum of the hands became more pronounced. The vitamin C excretion in the urine was 305 mg in twenty-four hours, the normal being at least 50 mg for the same period of time. There

was some calf tenderness but no evidence of thrombophlebitis. He was placed on a high vitamin intake. The purpuric lesions on the hands improved but the patient continued to lose much weight and to have anorexia. Several thoracenteses were done thereafter, and all smears and cultures of the fluid were negative

On the fortieth day he became very dyspneic and orthopneic, developed a more productive cough and was very restless His lungs revealed numerous moist rales, and a pleural friction rub was heard anteriorly to the right of the sternum at the 6 and 7 interspaces In the following two days his cardiac failure became more severe, he had developed auricular fibrillation and there was a friction rub at the left base Fluid again was removed from the left chest, its specific gravity was 1 008 Following thoracenteses, x-rays were described as showing "encysted areas of pneumothorax in the regions of the previous effusion" and "disseminated and confluent nodular productive infiltrations involving the major portion of both lungs " A Congo Red Test showed the four-minute sample to be 100 per cent, the one-hour sample, 90 to 95 per cent, there was no dve in the urine On the fortysixth day the patient expired

### Discussion

DR MAX TRUBEK There was a history of prolonged cough and purulent expectoration since the age of thirteen following bronchopneumonia after measles. We can surmise a widespread bronchiectasis. At no time were tubercle bacilli found in the sputum. The x-ray evidence of old apical fibrosis may represent obsolete disease which did not play any part in his subsequent course.

During this final phase the illness was characterized by progressive emaciation, periodic reappearances of pulmonary infiltrations involving the lower portions of both lung fields, and the reaccumulation of large amounts of pleural fluid which was clear and sterile. There was considerable chest pain at times, pleural in nature and intensified by respiration. Some of the chest pains were angulal in nature and distribution.

A low-grade febrile course with a mild leukocytosis persisted. There was never evidence of severe renal damage. The abnormal sediment may have been due in part to the presence of an old urethral stricture. A muscle biopsy did not confirm an impression of disseminated vascular disease. Electrocardiographic alteration, low voltage in all leads, with inversion of the T wave in leads II and III, lent support to the impression that some of his pain was on the basis of coronary arteriosclerosis and that there

might have been an old myocardial infarction One could not consider many of his chest find ings as due to congestive failure but on the basis of a progressive parenchymal infection of a nontuberulous nature.

Dr. EMANUEL APPELBAUM This case is rather difficult to interpret. There appear to be 2 important factors, namely, cardiac and pul monary The patient obviously had arteriosclerotic heart disease, with or without a provious closure of a coronary artery Whether or not be had in addition a cor pulmonale is difficult to decide on the basis of the information avail able. Unfortunately, venous pressure studies were not made The electrocardiographic find ings however, are consistent with changes occasionally encountered in chronic cor pul monale. With regard to the lungs there is no doubt that the patient had a chronic bronchitis The recurrence of pulmonary episodes with the development of fluid suggests a chronic in flammatory process, possibly of a tuberculous nature The picture is consistent with a diag nosis of chronic miliary tuberculosis of the protracted hematogenous dissemination type.

### Pathology

Dr. Henry Spitz The anatomic diagnoses were acute and chronic bronchitis, fibrosis and emphysema of lungs, bronchiectasis, infected lobular pneumonia, all lobes, organizing pneumonia right middle and lower lobes, chronic adhesive pleuritis with effusion, blateral, chronic adhesive pericarditis with calcification, hypertrophy and dilatation of heart, mainly right ventricle (Cor pulmonale), and sclerosis of coronary arteries.

Autopsy showed a cachectic, middle-aged white man. There was no peripheral edema. An old, healed laparotomy scar was present in the epigastrium and a healing incision was noted over the right calf. There was no free fluid in the abdominal cavity. The provimal loop of the jouinum communicated with a gastric stump by a competent old anastomosis and fibrous ad heatons attached the duodenum to the liver and gallbladder.

Both pleural cavities were for the most part obliterated by dense fibrous adhesions. In the pockets between these adhesions there were 500 ec of clear yellow fluxd on the right and 200 cc. of similar fluid on the left.

The percardial sac was likewise obliterated by fibrous adhesions that contained several large calcified plaques, one of which lay along the left lateral border of the heart.

The heart weighed 360 Gm. which was considered to indicate hypertrophy since all the other viscers were small and atrophic, the liver

e.g., weighed only 890 Gm and the spleen, 40 Gm All chambers of the heart were dilated. The hypertrophy was most marked in the right ventricle that measured 7 mm in thickness as compared with 13 mm for the left ventricle. The valves, save for mild diffuse fibrous, showed no important changes. The coronary arternes were considerably narrowed in many areas by atherosclerotic and calcified plaques, but were not completely occluded. The myocardium was traversed by minute gray streaks of fibrosis, but no gross infarcts were present. In the left auricular appendage a small mural thrombus was found

The intimal surface of the norta was puckered by many atherosclerotic plaques The kidnoys, which were small, weighed together 210 Gm and showed a finely granular surface.

The lungs weighed 650 Gm. each pleural surfaces were covered with torn fibrous adhesions The parenchyma was crepitant in The greater portion of the lungs was few areas subcrepitant or rubbery and on section a grayishred cut surface was revealed, extensively mottled with black All lobes were involved and in areas the cut surface was gray and glassy Foamy fluid exuded on slight pressure Plugs of puru lent exudate projected from the transsected small bronchi and bronchioles The larger bronchi and the trachea contained abundant mucopurulent exudate. The pulmonary arteries showed many small lipoid deposits The tracheobronchial lymph nodes were enlarged soft, and diffusely anthracotic.

The liver was small and markedly congested The gallbladder contained many tetrahedral calculi with rounded edges. Its wall was thickened The bile ducts were grossly unaltered The spleen was small, fibrotic, and congested The adrenals showed considerable cortical hyperplasia The other organs showed no important gross abnormalities The diaphragm, pectoral psoas, and anterior abdominal muscles appeared normal

Microscopic examination showed severe acute and chronic inflammatory reaction in the bronchi and bronchioles The lumins were filled with polymorphonuclear cells and the walls infiltrated with polymorphonuclear cells, lymphocytes and plasma cells. The elastic and muscular elements of the bronchi were disrupted. Adjacent interalveolar septa were thickened by granulation tissue. Many alveoli were distended and con tained varying numbers of red blood cells polyps, and macrophages. In some areas there were numerous heart failure cells." Sections taken from the right middle and lower lobes showed, in addition, extensive replacement of the exudate by granulation tissue filling many alveoli. The bronchioles and unobstructed alveoli were widely

dilated and occasional interalveolar septa were ruptured Many small pulmonary arteries showed intimal thickening Liver and spleen showed marked chronic passive congestion There was mild generalized arteriosclerosis. No other important changes were noted

### Conclusions

This patient apparently suffered from chronic bronchitis of longstanding, with resulting pulmonary fibrosis and emphysema. The sclerosis of the finer pulmonary arteries and the extensive pleural adhesions further added to the strain of the right ventricle, as evidenced by the hypertrophy and dilatation of this heart chamber. The blood supply to the myocardium was certainly limited by the marked sclerosis of the coronary arteries and the patient was probably on the verge of decompensation for quite some

Further decrease of oxygenation by a rather extensive organizing pneumonia and lobular pneumonia in all lobes was probably responsible for the fatal outcome The pericarditis probably did not materially embarrass the heart Concretio cordis produces peripheral and, especially, hepatic congestion only when there is abundant thick dense scar tissue constricting the orifices of the venae cavae and holding the heart in a viselike constriction, thereby impeding the diastolic dilatation of the chambers 1 This was not present in the case under discussion The calcified plaques were so located in the loose fibrous adhesions as not to compress the veins emptying into the auricles

# SCIENTIFIC EXHIBITS 1948 ANNUAL MEETING

Applications for space for the scientific exhibits should be made directly to Chairman of Subcommittee on Scientific Exhibits of the Convention Committee

Dr J G Fred Hiss 505 State Tower Building Syracuse 2, New York

The Annual Meeting will be held May 17 to 21, 1948, at the Hotel Pennsylvania in New York City

No Applications can be considered after January 15, 1948

There will be two groups of awards

Awards in Group I are made for exhibits of individual investigation, which are judged on the basis of originality and excellence of presentation

Awards in Group II are made for exhibits which do not exemplify purely experimental studies and which are judged on the basis of excellence of presentation and correlation of facts

W P ANDERTON, M D, Secretary

#### CARBON TETRACHLORIDE POISONING

Report of Seven Cases with Two Deaths
IRVING GRAY, MD, FACP Brooklyn, New York

ARBON tetrachloride is one of the most widely used organic solvents by reason of its action as a solvent which is noninflammable It is frequently used as a dry cleaning fluid because it is noncombustible. In industry it is used as a decreaser of metals, as a solvent for rubber, and as a fire extinguishing agent reactions may result from a short exposure to a high concentration of the vapor from prolonged or frequently repeated exposures to moderately high concentrations, or from regular, daily ex posure to low concentrations in excess of known or accepted safe limits 1. The highest concentration of carbon tetrachloride permissible in workrooms is usually given as from 50 to 100 parts per million \*

Toxic effects are produced either by the in halation of the vapor, through skin absorption, or through ingestion. Acute poisoning is usually due to breathing in an atmosphere containing high concentrations of carbon tetrachloride. The results of inhalation experiments on humans were reported by Lehman and Flury 1 In some instances habituation or an increase in tolerance to the effect of carbon tetrachloride has been reported 4 Carbon tetrachloride is a metabolic poison as indicated by numerous experiments on animals and findings in humans.\* The United States Department of Labors in 1941 listed 48 occupations in which there is exposure to the absorption of carbon tetrachloride. Occasionally a delayed fatal type of poisoning, with death occurring one to two weeks after exposure to a single inhalation of high concentration of carbon tetrachloride, may occur Dillingberg and Thompson reported the occurrence of 20 cases of poisoning following the use of the solvent for cleaning the deck and bulkheads without adequate ventilation in a confined compartment of a submarine. Only two men had worked with the solvent and the rest inhaled the fumes over a period of two days because of their proximity to the workers. Death occurred in only one in stance when the patient, apparently on the road to recovery, developed acute pulmonary edema and died Although renal damage was present in eleven patients, there were no evidences of gross liver damage.

The report of these cases of carbon tetra chloride poisoning serves to remind the medical profession of the dangers inherent in chemicals which are widely and at times carelessly used both in industry and among the general population.

#### Nonfatal Cases

Case 1 -F A., a negro man, 41 years of age, worked for a period of eleven years mixing all sorts of chemicals, especially carbon tetrachloride in the manufacture of polishes. In July 1941, he began to complain of blurring of vision Two months later faundice set in associated with nauses, vom iting weakness, and weight loss. Examination approximately two months after the onset of the illness revealed a slight enlargement of the liver with diminution in vision affecting both eyes. The icterus index was increased and the van den Bergh was a delayed positive. There was a slight hypochromic anemia Various liver function tests were within the range of normal. The patient improved following his removal from work. The liver became normal in size, the interus index returned to normal, and the anemia improved following therapy The blood test and spinal Wassermann test were reported as positive Colleidal gold study of the spinal fluid showed a paretic type of curve (555-321-000). Four months prior to the onset of the patient's Illness, examination of the eyes revealed normal findings. During the height of the patient s acute illness there were no abnormalities on examination of the urine and renal function studies were normal

Symptoms referable to the central nervous system are known to have occurred and have been described. Although changes in the optic nerve can occur in individuals with luce of the central nervous system, the onset of sudden manifestations refer able to vision in this individual who developed clinical and laboratory ovidences of acute carbon tetrachloride poisoning was attributed to the in halation of carbon tetrachlorides.

Case 2 -J R. a white man, 44 years of age, was employed as an electrician on ships. He was engaged in cleaning out armatures in the engine room. working with pails of carbon tetrachloride pouring the stuff over the armature. On the second day, the patient complained of names vomiting, diar rhea, weakness, dissinces, and blurring of vision. He was removed from his environment and treated at home and subsequently at the hospital in accordance with the recommendations of Davis and Haneline and Allison. Within several days after exposure, there was a progressive diminution in secretion of urine The patient voided approximately 500 cc. on the fourth day of his illness. Examination of the urine at this time showed a four plus albumin, and on microscopic study there were 10 to 15 white blood cells and an occasional

Presented at the 141st Annual Meeting of the Medical Boriety of the State of New York, Buffalo, Section on Industrial Medicine, May 7 1947

red blood cell per microscopic field. There was a progressive increase in both the systolic and diastolic blood pressure At the end of two weeks the blood urea was 150 mg per cent, the blood creatinine was 7 5 mg per cent and the nonprotein nitrogen, 180 mg per cent On the twelfth day the blood pressure was 190/110 The liver was slightly enlarged but there was no laundice and no increase in the icterus index Convulsive seizures were associated with the laboratory findings as reported above The patient responded to intravenous hypertonic glucose in Hartman's solution to combat acidosis In addition, he received insulin in small doses, two to three units of U-20, four times daily to facilitate metabolism of carbohydrates, proteins, and fats He also received calcium glu-conate intramuscularly The patient was on a high carbohydrate, moderately high protein, and At the end of the second week a few low fat diet granular casts and 2 to 8 red blood cells were noted in each microscopic field on examination of the urine

Approximately seventeen days after exposure. clinical improvement became manifest by decrease in the severity and frequency of the convulsive seizures associated with a gradual drop in the blood urea, nitrogen, and blood creatinine. At the end of the third week, the systolic pressure ranged between 150 and 160, and the diastolic between 90 and 100 At the end of the fourth week, the systolic blood pressure was 130 and the diastolic, 80 The blood creatinine and urea reached normal levels at the fifth week. The icterus index was at no time elevated Approximately seven weeks after the acute onset of symptoms the unne showed normal findings The blood chemistry was normal and the systolic blood pressure ranged between 120 and 130 The diastolic pressure ranged between 78 and 84 The heart size, as determined by teleroentgenographic study, was normal. The electrocardiogram, sedimentation rate, blood count, and all other studies revealed normal findings two months after the onset of the acute poisoning The patient was last examined four months after the renal complications of acute carbon tetrachloride poisoning and, on physical examination and after complete laboratory studies, evidenced no abnormalities It is evident from this case report that the patient had an acute toxic nephrosis due to carbon tetrachloride, in which there was an uncomplicated recovery The clinical and laboratory studies in acute toxic nephrosis due to carbon tetrachloride poisoning were thoroughly described by Corcoran and his co-workers 10

Case 3—J W, a white man, 32 years of age, was employed for several years as a marine electrician In June, 1946, he was cleaning electrical equipment on a tug-boat, using carbon tetrachloride and kerosene, spraying under pressure. Four days after this exposure he began to complain of headache, nausea, dizziness, "felt flushed and tired and became yellow." The patient was removed to a hospital and treated there for a hepato-renal syndrome. The jaundice gradually receded and evidence of touc nephrosis lessened. When the patient was first seen two months after this episode.

he still complained of headaches, dizziness, and weakness He had lost twenty pounds in this period of time He still had a slight anemia (Hemoglobin was 75 per cent or 129 Gm. The red blood count was 3.950,000) The differential blood study was normal except for the presence of 7 eosinophils There was a gradual return of the blood urea, blood creatinine, and the icterus index to normal liver, which was enlarged and felt three finger breadths below the costal arch when the patient was first seen, did not return to normal size for about four months, although liver-function studies were normal two months after the onset of the acute The patient responded to intravenous illness glucose and calcium therapy, and a diet high in carbohydrates and proteins but free from all fats The patient was last seen six months after the acute exposure and all findings on physical examination and laboratory investigation were normal except for a slight secondary anemia. In this instance there were clinical and laboratory evidences of the hepato-renal syndrome due to carbon tetrachloride absorption The patient made an uneventful re-

Case 4 -S L, a white man, 21 years of age, worked for approximately two months using carbon tetrachloride while cleaning machinery. The carbon tetrachloride passes through a rubber hose and "is worked by a pump cleaning the machinery, but quite a bit gets in the air" The machines were cleaned about 4 to 5 times a day, twenty minutes at a time Two months after this type of work, the patient began to complain of nauser, vomiting, "cramps and pain in the stomach," and headaches The essential finding on examination was the slight enlargement of the liver with an icteric tinge of the conjunctiva The icterus index was 14 There were no abnormal findings on examination of the Blood chemistry studies were normal The patient had a slight anemia He was removed from his occupational activity and gradually improved following the use of an adequate diet and intramuscular injections of calcium gluconate, liver extract, and vitamin B Liver function studies and the icterus index were normal within two months after removal from contact with carbon tetrachloride

Case 5 -M L, a white man, 40 years of age, worked for approximately twelve months in a laboratory using carbon tetrachloride to clean metal The patient was accustomed to taking six to eight glasses of beer daily About one year after he began working, "had trouble with my stomach-nausen, vomiting and became joundiced" The patient was hospitalized for a period of two months He was treated for a hepatitis due to carbon tetrachloride poisoning The liver was enlarged about two finger breadths below the costal arch Laboratory investigation revealed evidence of injury to the liver parenchyma. The icterus index gradually dropped from 24 to 10 at the end of two months when the patient was discharged from the hospital There were no renal complications When he was last examined three months after the onset of his illness the edge of the liver was felt on deep inspiration, but all studies including various laboratory procedures for liver function revealed normal findings. (Bromsulfalcin test—less than 10 per cent of the dye recovered in half an hour. Icterus index was 8 the hemoglobin was 88 per cent or 14 96 Gm. The red blood count was 4 500 000, white blood count and differential study were normal Urea, nitrogen, and creatinine revealed normal findings.)

#### Fatal Cases

Case 1 -C M, a white man, 88 years of age, had worked for a period of six years as a "refrigeration mechanic using carbon tetrachloride to degrease various metals.' In the latter part of 1938 the patient developed jaundice and was found to have an enlarged liver and an enlarged spicen Labora tory investigations revealed essentially normal findings except for an increase in the leterus index (16) and a secondary anomia with associated macrocytosis. The patient responded to treatment and within six months after the onset of the hepatitus ascribed to the absorption of carbon tetrachloride there was a normal blood count and the icterus index was normal. The patient continued in his consumption of beer and whiskey and the size of the hver did not recede When examined nine months after the onset of his acute illness, the liver was still felt two finger breadths below the costal arch. The spleen was not felt. The patient stated that I worked for six years with carbon tetra chloride which was kept in open pans and used for degreasing metals. The patient returned to work approximately six months after the onset of his acute illness and was not exposed again to the absorption of carbon tetrachloride. The use of this substance had been discontinued. However it was evident that there were progressive liver changes and the patient developed the clinical syndrome of cirrhesis of the liver There was progressive jaun dies associated with the clinical picture of an atrophic cirrhosis of the liver The patient died about three years after the onset of his first symptoms of hepatic disease After autopsy the follow ing findings were described on examination of the liver

Autopsy Findings —Liver was pale grayish yellow color markedly firm, moderately diminished in size with presence of finely granular surface Beneath the capsule of the anterior surface right lobe were numerous pur point dark blue and recognitive areas. The cut surfaces were translucent and grayish yellow with widely scattered minute, opaque yellow zones. Microscopic.—Dogeneration of the liver cells shown with mild stass (organ not grossly deformed but finely granular) Changes in the liver were those of an old cirrhosis with varicustic of gastric and esophageal volus hyper plastic spleen There was evidence of recent, severe, acute liver damage superimposed upon old pathologic process and subacute yellow strophy

In this instance we are dealing with a known alcoholic addict who was exposed to the absorption of carbon tetrachloride over a period of any years. From a description of his work, the patient had had

repeated contact of the skin with the hourd and absorbed the carbon tetrachloride probably directly through the skin It is stated that alcoholic addicts, obese persons, undernourished individuals, and those ill with diabetes liver or renal disease are likely to be especially susceptible to the effects of absorption of carbon tetrachloride.1 In this case the patient was a known alcoholic addict for many years and when first seen was joundiced and had an enlarged liver The size of the liver did not return to normal. and there is reason to believe that the continuous intake of alcohol over a period of many months and years following the symptoms of carbon tetra chloride intoxication, was probably the cause of the progressive changes in the liver long after all the acute manifestations of carbon tetrachloride poisoning had subsided On the basis of the pathologic report, there were findings in the liver of an old pathologic process with evidence of recent, severe acute liver damage. Although there were clinical findings to indicate that the patient had recovered from his carbon tetrachloride poisoning within several months after he first took ill the question is speculative as to whether or not there were progressive changes in the liver due to carbon tet rachloride following a superimposed effect produced by the daily intake of alcohol for about three years, up to the time of death.

Case 2 - J H. a white man, 33 years of age, was employed as an electrician for a period of about two years. He worked for eight hours 'with a gallon or more of carbon tetrachloride to dry the main propulsion motor which had been submerged The carbon tetrachloride was shot into the motor by means of a fire extinguisher. The work was done in the main engine room below deck. After several hours of exposure to the inhalation of carbon tetra chloride, the patient felt 'woozy began to have nausea vomited, and had pains in the stomach Within forty-eight hours the patient had evidence of both renal and liver damage There were progressive clinical and laboratory findings of hepatic and ronal insufficiency with death occurring ten days after exposure to the inhalation of carbon tetra chloride The essential findings at postmortem examination were as follows There was congestion of the viscers with the liver nutmeg, congestion of the spleen, stomach small intestine and edema of the kidneys.

Microscopic Examination of the Kidneys In general the glomeruli were normal. The glomerul capillaries in most instances were dilated. The afferent arteriols as it entered the glomaruli was extremely dilated. Here and there the cells lining Bowman's capsule were swellen. The tubules for the most part were dilated. At the surface, many tubules were degenerated some completely others partially. Here complete degeneration was observed. The area was occupied by loose connective tissue infilitrated with a very occasional lymphocyte. In the medulla Honk's loops and a few of the ascending and descending tubules were plugged with a coarse cosinophilig granular material resembling a hemoglobin cast. In an occasional tubule also were found free epithelial cells. In still until the coarse of the coarse of the coarse of the coarse of the coarse occasions.

other tubules there was an occasional red cell Scattered here and there were remnants of tubules partially replaced by small basophilic bodies resembling small collections of calcium. In the medulla there was an intense engorgement of capillaries with red cells Arterioles showed no essential Toxic nephrosis intrinsic change  $D_{lagnosis}$ 

Microscopic Examination of the Liver sential pathology was observed in the inner one third of the liver lobules Here the central veins were dilated and engorged with blood cells about the central vein were for the most part completely disintegrated Here and there in these areas there was round cell infiltration sinuses were distended with blood. In an occasional bile capillary a so-called bile thrombus was found Scattered cells contained large clear vacuoles Diagnasis Acute necrosis of the liver

This patient was a known alcoholic addict He had inhaled carbon tetrachloride for a period of eight hours. There was no response to therapy and clinically the patient had evidence of a hepatorenal syndrome due to acute carbon tetrachloride poison-Microscopic examination of the liver showed an acute necrosis and examination of the kidneys revealed evidence of a toxic nephrosis

Exposure to the absorption of carbon tetrachloride and the onset of hepatic disease as manifest by jaundice does not necessarily indicate that the liver disease is due to the absorption of this organic solvent Two years ago, a man, aged 58, who had been working for a period of three years in a cleaning and dyeing establishment, developed naundice and enlargement of the liver In his work, he was exposed to the absorption of various solvents including carbon tetrachloride Upon removal from his work and adequate therapy, there was a period of temporary improvement which led to the assumption that the patient's jaundice was due to a hepatitis of occupational origin After this temporary period of improvement, the patient went progressively downhill The liver became irregularly enlarged and there was marked weight A diagnosis of carcinoma with biliary tract obstruction and metastasis to the liver was made The patient died about eight months after the onset of his first symptoms At postmortem, a carcinoma of the head of the pancreas was found 11 The early and clinical impression when this patient was first seen, that he had a hepatitis due to carbon tetrachloride absorption, was not borne out by subsequent events

In individuals of middle age, the onset of jaundice and hepatic disease may be due to any one of several factors such as carcinoma, silent stone in the common duct, hepatitis of infectious origin, and other causes These conditions should be considered in the differential diagnosis even though the individual is exposed to the absorption of carbon tetrachloride

### Discussion

Dr Marvin L Amdur. Buffalo -The majority of the cases which Dr Gray has presented have occurred as the result of exposure to carbon tetrachloride (CCL) vapor during the course of degreas-Other than its other iming electrical equipment portant application in home or industrial dry cleaning, no other single application is as productive of as much personal exposure It is perhaps fortunate that the usual degreasing operations employ trior perchlorethylene in standard degreasing equip-Were carbon tetrachloride as commonly used, its greater toxicity would make for considerably more trouble Particularly is this so if. as so frequently happens, safety supervision is poor, or the personal operational procedures are bad with resulting too rapid operation, excessive agitation of the solvent, or excessive dragout One would. too. have to contend with mechanical breakdown and improper installation. It is unfortunate that carbon tetrachloride finds its most popular application where supervision in its use is minimal and, apparently, respect for its toxicity is least

Dr Gray has pointed out the incompatibility of alcohol and CCl, and how, in the presence of the former, the toxicity of the latter is enhanced This should emphasize to those of us doing industrial preplacement examinations the necessity of excluding from degreasing operations all alcoholic addicts as well as persons with diabetes and any who present recordable defects of their hepatic or renal systems or in whom a previous history of disease af-

fecting these systems can be obtained

I should like to say a word with respect to the periodic examination of those already employed in degressing operations It is very difficult to antici-The usual laboratory procedures pate trouble are of greater value in confirming an obvious exposure than in aiding in the anticipation of an impending disability I would suggest a good functional inquiry, particularly with respect to weakness, anorexia, and disturbances of sleep and vision, supplemented with a careful examination Dr Gray has illustrated how general medical diseases may mimic, masquerade as or coexist with occupational The differential as always must be whether or not an adequate exposure has occurred we are apt to be confused by the great variability in accepted safe working levels for atmospheric contamination The New York State Department of Industrial Hygiene considers 75 parts per million as a safe working level for an eight-hour day However, we are all aware of how serious illness and even fatalities may follow what quantitatively seems to be a trivial exposure Perhaps there should be some downward revision of permissible concentration to 50 parts per million or even to 30 parts per million

One last point with regard to the treatment of individuals overcome with solvent vapor toxicity of the aliphatic hydrocarbons is greatly increased upon the substitution of the third halogen atom in their structure. Some of this toxicity is directed toward a markedly increased irritability of the heart, particularly in its sensitivity to the

effect of adrenalin. Thus adrenalin given as a stimulant may induce a fatal ventricular fibrilla tion By the same token what I have said about carbon tetrachloride would apply to chloroform (CHCl.) or tribromethanol.

#### MEETING OF ACADEMY OF DERMATOLOGY AND SYPHILOLOGY

The sixth annual meeting of the American Acad emy of Dermatology and Syphilology will be held in Chicago from Saturday, December 6 through Thursday, December 11 it has been announced by Dr Earl D Osborne secretary-treasurer of the Acad-emy, 471 Delaware Avenue, Buffalo New York The principal sessions will be held at the Palmer

House, with special courses in histopathology and mycology scheduled for Saturday and Sunday, December 6 and 7, at the medical schools of the University of Illinois and Northwestern University Oniversity of minos and vortainesser ourversity of Historic College of Medicine, in Chicago on the after nooms of December 8 0, and 10

Special courses in historathology mycology, x
ray and radium therapy bacteriology of the skin, mucous membrane lesions industrial dermatoses,

specific granulomata and dermatoscleroses will be given by leaders in these various fields.

Subjects to be discussed in symposia will include physiology and chemistry of the skin physical and pharmacoutical therapy cutaneous allergy syphilis pharmacoutical therapeutics, and diagnostic methods in dermatology Other features will be a round table discussion on dermatopathology and a panel

on management of skin diseases. Special lectures will be given on "Afferent and Efferent Nerve Impulses of the Skin by G H Bishop Ph.D. professor of neurophysiology, Washington University, St. Louis, Missouri "Virus Discases of the Skin, by Dr Harvey Blank, University of Ponnsylvania, and 'A Study of the Mechanism of the Urticarial Reaction" by Dr A.C Ivy vice-presi-

dent University of Illinois.

### ANNOUNCEMENT OF VAN METER PRIZE AWARD

The American Association for the Study of Goiter again offers the Van Meter Prize Award of \$300 and two honorable mentions for the best essays submitted concerning original work on problems related to the thyroid gland. The Award will be made at the annual meeting of the Association which will be held in Toronto, Canada, May 6 7, and 8 1948 provid ing essays of sufficient merit are presented

The competing essays may cover either clinical or research investigations should not exceed 3,000 words in length, must be presented in English and a typewritten, double-spaced copy sent to the cor

responding secretary, Dr T C Davison 207 Doctors Building, Atlanta 3 Georgia, not later than February I 1948. The committee who will review the manuscripts is composed of men well qualified to judge the merits of the competing essays.

A place will be reserved on the program of the annual meeting for presentation of the Prize Award Essay by the author if it is possible for him to attend. The essay will be published in the annual Proceed ings of the Association. This will not prevent its further publication however in any journal selected by the author

#### INSTRUCTION FOR GENEVA ACADEMY OF MEDICINE

"Modern Methods in the Prevention and Treat ment of Infectious Diseases" is the subject of the postgraduate locture which will be presented to the Geneva Academy of Medicine by Dr William J Orr on December 18. Dr Orr is professor of pediatrics at the University of Buffalo, School of Medi-cine. The lecture, given by the Medical Society of the State of New York with the cooperation of the New York State Department of Health will take place at 8 30 p.m. at the Seneca Hotel in Geneva-

# **EVALUATION OF PENICILLIN IN TOPICAL THERAPY\***

J Lowry Miller, M D , New York City, Juan J Rodriquez, M D , San Salvador, and Anthony N Domonkos, M D , New York City

(From the Department of Dermatology of the Vanderbilt Clinic and Columbia University, College of Physicians and Surgeons)

IN RECENT years a number of new effective agents against pyogenic infections of the skin have been introduced. Evaluation of the indications and limitations of each substance depends on the carefully controlled work of many investigators.

We have treated 250 patients locally, with ointments containing penicillin, penicillin and sulfadiazine or sulfathiazole, Furacin, sulfur in suspension and, recently, bacitracin. Of this number 173 patients have been sufficiently studied to furnish the basis of this report

Early in our experience we came to the conclusion that application of penicillin on the skin can best be accomplished when it is incorporated in an ointment base The ease of application, the relative stability, the effectiveness, and the certainty of strength of penicillin in ointment bases made the preparation of fresh solutions of penicillin unnecessarv Florey and Jennings found the calcium salt to be nonhygroscopic in contrast to the very hygroscopic sodium salt 1 For this reason outments prepared with the calcium salt This agrees with the conremain more stable clusion of Hallett, Osborne, and Jordan after testing and trial of a number of ointments 2 We used an ointment containing amorphous calcium penicilin in anhydrous petrolatum

### Penicillin Ointments

In order to determine if any significant difference in effectiveness could be demonstrated we used ointments containing 500, 1,000, and 2,000 units of penicillin per gram. A series of cases was also tried on a combination of 1,000 units of penicillin and 10 per cent sulfadiazine or sulfathiazole

Cultures were taken on all cases to isolate the responsible organism and to test its sensitivity to penicillin. The cultures were made in casein digest broth containing rabbits' blood. The sensitivity of the organism to penicillin was determined by the dilution method. Organisms whose growth was inhibited by 0.1 unit of penicillin per cc. or less were classified as sensitive. In

our series all organisms were either sensitive to 0 1 unit per cc or else were resistant to 10 units per cc No attempt was made to test with higher concentrations of penicillin

Patients were instructed to use hot compresses of boric acid for ten minutes or longer, three times a day. Saline compresses were later substituted for the boric acid to avoid possible ill effects from using boric acid, as reported by Watson. The necessity for the removal of crusts in superficial pyodermas is obvious. In our series most of our failures and those requiring long periods to clear could be traced to not removing crusts. Hot compresses remove crusts painlessly and, in children, this usually means the difference between removal of crusts and half-hearted attempts with failure. We have seen numerous examples of irritation produced by soap and water.

Heavy metals, acting as catalytic agents, speed up the oxidation and, thus, the destruction of penicillin Hydrogen peroxide and potassium permanganate also hasten the cadation of penicillin and should not be used as wet compresses before applying penicillin ointment

### Results of Penicillin Ointment

Table 1 shows that of 175 cases of impetigo treated with different strengths of penicillin and with penicillin combined with sulfadiazine or sulfathiazole, 91 were followed adequately was obtained in all but 2 patients, both of whom became sensitized to penicillin The median time of cure was six days for the 500 and 1,000 units of penicillin per gram and five days for the 2,000 units, and the 1,000 units of penicillin plus 10 per cent sulfadiazine or sulfathiazole ence to Table 4 shows that in the cases of impetigo staphylococci were found in pure culture in 74 per cent, streptococci in 105 per cent, and mixed infections in the remainder Seventy-five per cent of the cases with staphylococci in pure culture and all but two of those with streptococci were sensitive to penicillin The sensitivity of the mixed infections was much lower Staphylococcus aureus hemolyticus was the responsible organism in 71 per cent of the cases Staphylococci were tested for pathogenicity with mannitol or coagulase

In ecthyma, of the 14 cases followed, the median time of cure, namely six days, and the percentage of staphylococci in pure culture were the same as

Presented at the 141st Annual Meeting of the Medical Society of the State of New York Buffalo, Section on Dermatology and Syphilology May 8 1947

<sup>\*</sup>The penicilin ointment was supplied by Abbott Laboratories North Chicago, Illinois Furacan by Eaton Laboratories Inc. Norwich New York and the bacitracin ointment by Ben Venue Laboratories, Bedford Ohio

<sup>\*</sup> These figures are the percentages of the total group of paltents studied

for impetigo Mixed cultures were less frequent but, when present, were resistant to penicillin in 100 per cent of the cases

Chineal and bacteriologic differentiation between simple folliculities of the beard and the very resistant cases of sycosis vulgaris is almost impossible. For that reason we have classified all as folliculities. However if the differential diagnosis is made on duration of infection alone 5 of the cases were of more than eight months' duration and 4 of the treatment failures occurred in this group. The fifth treatment failure resulted from sensitiation of the patient to penicillin. As before, the Staph, aureus hemolyticus predominated in both the cases of short and long duration.

In the group of various dermatoses with second ary infection listed in Table 2 pencillin ointment proved of outstanding value in clearing the second ary infection but of no value against the primary dermatosis However sensitization to penicillin was noted in 10 per cent of the patients in this group

The report of Rammelkamp and Keefer sug gesting that experimental studies showed a synergustic action between penicillin and the sulfon amides caused us to try a series on a combination of 1 000 units of penicillin and 10 per cent sulfa diagne or sulfathiaxole <sup>4</sup> The results in 17 cases of impetigo showed a median time of cure of five days in 0 cases of eethyma, a median time of cure of six days. No evidence of sensitization of the patients was noted.

The objection is often raised to the use of the sulfonamides and penucillin locally because of the inherent danger of sensitization of the patient, thus preventing their use parenterally in a serious illness. To offset this objection we were prompted to use Furacin (5-nitro, 2-furaldehyde semicarbazone) which is not intended for systemic use. Dodd and Stillman demonstrated Furacin to be

both bacteriostatic and bacteriocidal for a number of gram-positive and gram-negative pathogenic bacteria. Dodd, Hartman, and Ward found the material nonirritating upon local application and no evidence of toxicity after prolonged application. Downing, Hanson, and Lamb, Snyder, Kiehn, and Christopherson; Shipley and Dodd, and others have reported on its local use in humans

Exactly the same procedure as in the penicillin series was carried out. Bacteria sensitive to dilutions of Furacin of 1 to 10,000 or higher were classified as sensitive.

### Results of Furacin

In Table 3 the results of using Furacin in 46 patients are recorded. Two patients, or 5 per cent, developed sensitization evidenced by a vesicular dermatitis adjacent to the areas under treatment. Of the 18 cases of impetigo treated, 16 were followed adequately with a median time of cure of eight days. The decided increase in mixed cultures probably should be discounted due to a change of technical assistants. The results in clearing the secondary infections in hypostatic ulders (Ulcus cruris) of the lower extremities in a median time of seven days were encouraging

A small series of cases has been tried on sulfur in suspension. Weld and Gunther have reported a method of preparation of sulfur in Carbowax and given results showing inhibition of growth of many gram-positive cocci when using dilutions as high as 1 to 500 to 1 to 2,000. The preparation seems to be of particular value in treating seborrheic dermatitis.

A similar small series has been tried on bacitracin Bacitracin is a new antibiotic, the discovery of which was reported by Johnson, Anker, and Meleney <sup>11</sup> In a subsequent report Meleney and Johnson<sup>12</sup> found that of 100 patients with a variety of surgical infections as boils, abscesses, infected cysts, and the like, 31 per cent showed excellent results when bacitracin was used either locally or injected into the lesion Fifty-seven per cent showed good results We have treated only a few cases with bactracin with adequate follow-up. We have used 500 units of bacitracin per gram in a base of Carbowax and propylene glycol. Obviously, no conclusions are justified but our impression is that it is effective in treatment of superficial pyogenic infections.

### Comment

Most observers are agreed that penicillin ointment is a very effective agent in the treatment of superficial pyogenic infections. In three days Wright and Gross cured 21 of 25 patients with impetigo, when using 1,000 units of penicillin per gram 12 Cohen and Pfaff reported very satisfactory results in the treatment of impetigo 14 Our results with 91 cases of impetigo cured in a median time of six days confirm this opinion. One of us (J L M) found that sulfathiazole or sulfadiazine cured 45 patients with impetigo in a median time of six days 14 From these findings we conclude that penicillin or the sulfonamides are 'equally good and to date unsurpassed from the standpoint of rapidity of cure in superficial pyogenic infections

Ecthyma yields in a manner similar to that in impetigo, usually a little slower, although in this series the results were as quick

In folliculitis the results are very variable Cooke reported clearing 14 cases of uncomplicated sycosis vulgaris with a spray of penicillin filtrate <sup>16</sup> In our cases simple folliculitis yielded rather quickly but true sycosis vulgaris was usually resistant, 4 out of 5 cases being failures

The addition of the sulfonamides to the pencillin ointment produced no dramatic change in the rapidity of clearing of the lesions. Most dermatologists do not approve of the use of sulfonamide ointments locally because of the known danger of serious reactions from sensitization. This danger of sensitization to the sulfonamides, particularly in the absence of dramatic response in the rapidity of cure, rules out the combined use

In the matter of concentration of penicillin we

<sup>\*</sup> Percentage of staphylococci and streptococci in total number of cases.

found little difference in results whether we used 500, 1 000 or 2 000 units per gram of ointment

Cormia and Alsever reported achieving satisfactory results when dealing with resistant (above 0 units of penicillin per cc.) staphylococci by in creasing the strength of the ountment to 5,000 to 100,000 units per gram. In Hopkins and Lawrence found this true in similar cases but state that sensitization of the patient to penicillin occurred more frequently. Because of this danger of sensitization by larger doses and because of the satisfactory results obtained with 500 units of penicillin per gram we feel this to be the ideal strength.

Since penicillin ointment has proved a very effective agent in the treatment of superficial pyogenic infections in the experience of many workers, the only objection to its use is the factor of sensitization of the patient. This factor of sensitization from local therapy is of importance from two standpoints first the percentage and the degree of the resulting contact dermatitis and, second the probability of occurrence of this reaction from internal administration preventing the use of penicillin in a senious illness. Penicillin

was early shown to be capable of causing contact dermatitis in persons handling the drug. Fried laender, Watrous and Feinberg report 5 cases of this type and review earlier reports by several observers. This is borne out by Gottschalk and Welss who found that of 7 patients who had prolonged contact with ponicillin 7 reacted to a patch test of penicillin outment. In our series the percentage of sensitiation was low 2 per cent in impetigo. This agrees with other observers who were dealing with patients who had come in contact with penicillin little if at all, and in whom the period of use was relatively short.

In folliculitis our percentage of sensitization increased probably because two patients had used penicilin previously. On the other hand evidence is accumulating that, with the use of penicillin in many forms as lozenges, nose sprnys, and even patch tests alone, the percentage of patients developing sensitization is rising. Pillsbury, 12 quoting Hopkins and Lawrence, and Wrong suggests 10 to 11 per cent to be more nearly the correct figure and that penicillin in-oil given intra muscularly be substituted as less likely, to cause epidermal sensitization.

Several observers have reported instances in which intramuscular use of penicillin has apparently sensitized the patients causing a contact dermatitis reaction. The evidence is meager for the reverse. Most observers are agreed that to date the reactions have been unusually mild, frequently transient, and seldom interfering with treatment. Mahoney has not been forced to treatment with penicillin in a single case in over 5,000 patients because of reactions <sup>22</sup> Cannon reports the same in 1,000 cases <sup>23</sup>

Many dermatologists feel that penicillin like the sulfonamides should not be used locally. We feel that, considering all the evidence to date, this view is too extreme and that its use locally is justified in a strength of 500 units per gram for a short period. The use in previously eczematized areas is open to question and for long periods it is to be condemned.

Furacin offers an agent in which parenteral use need not be considered. Sensitization is a factor here, also resulting in contact dermatitis. We found a 5 per cent incidence in our series. Downing, Hanson, and Lamb found less than 1 per cent in one series of 147 cases and over 10 per cent in another series of 63 patients with a different lot of Furacin. Here again the eczematized patient is the one more likely to react. In our series the number of cases of impetigo is too small for accurate comparison and it is only our impression that the median time of cure of impetigo of eight days as compared with six days with penicillin may be of significance.

Our experience with sulfur in suspension and bacitracin is, as yet, too limited to be of value But the results so far point to a value for sulfur in suspension particularly in seborrheic dermatitis Bacitracin has given some excellent results in the same type of case which yields to penicillin, and has resulted in failure in the type in which penicillin fails

## Conclusions

- 1 Penicillin ointment is very effective in the treatment of impetigo and ecthyma
- 2 Penicillin ointment is of value in simple folliculitis, of little value in true sycosis vulgaris
  - 3 Five hundred units of penicillin per gram

is adequate concentration and is not as liable to cause sensitization as higher concentrations

- 4 Combinations of penicillin and the sulfonamides in ointments should not be employed
- 5 Sensitization of the patient resulting in a contact dermatitis occurs in 2 to 13 per cent of cases, increasing on prolonged contact, repeated exposure, and previous eczematization of the skin
- 6 Epithelial sensitization from local application of penicillin precluding the use of penicillin for serious illness is rare
- 7 Furacin is effective in the same diseases as penicillin ointment. It, too, produces sensitization resulting in contact dermatitis, 5 per cent in this series. Furacin has an advantage in that internal use is not intended.

371 PARK AVENUE

### Discussion

Dr Joseph J Hallett, Rochester, New York —I am in full accord with the conclusions of Dr Miller's paper

Pencillin ointment is most efficient in the treatment of pyodermas such as impetigo, ecthyma, and superficial folliculitis The results of pencillin ountment in sycosis vulgaris have been very disappointing in my experience, even when the strength of the ountment is increased to 100,000 units per gram of ointment Penicillin ointment is of value in treating infectious eczematoid dermatitis, especially those of the external ear following a chronic discharging ear It also has proved of value in treating some cases of chronic postauricular dermatitis of longstanding, especially when there is marked fissuring behind the ear These probably are due to seborrhea, with a superimposed staphylococcus

I do not believe penicillin and the sulfonamides should be incorporated in an ointment for topical use. There is no clinical evidence that the suggested synergistic effect is sufficient to warrant their combination.

The increased probability of cutaneous sensitization to sulfonamides far outweighs their clinical advantage, if any While penicillin does cause some cutaneous sensitization, it is about 7 per cent, the sensitization to sulfonamides is twice this. The usual cutaneous reaction to penicillin is a dermatitis venenata. This may occur as early as the

fifth or sixth day of treatment. It is difficult to ex plain this early consitization. The only suggestion I have to offer is that penicullin, when used topically is always applied on an inflamed or eroded skin, and under such circumstances the epidermal cells may more rapidly become sensitized. I have seen one localized urticarial reaction to the local use of penicillin, and here again it was applied to an ulcer I have never observed, as yet, any vesicular reaction of the toes, fingers or groin following the use of penicillin locally on some other area of the body I have seen this type of reaction following only intramuscular administration of penicillin.

It is my usual procedure in using penicillin oint ment to have the patient return in five or six days, at which time, if there is not marked improvement. I discontinue penicillin ointment and prescribe Furacin or some other cintment. By this means, I believe I have been able to reduce the number of reactions to penicillin ointment.

Furacin is rapidly gaining in popularity as an ef fective treatment in superficial pyogenic infection Here again one must always remember that consiti zation does occur but it is my impression that the percentage of sensitization is low

I have had no experience with the sulfur suspen sion or bacitracia.

#### A.M.A. HEAD URGES CAMPAIGN AGAINST VASCULAR DEGENERATION

In a paper delivered before the annual meeting of the Kentucky State Medical Association in Louisville, Kentucky, September 30 Edward L Borts
M.D of Philadelphia, president of the American
Medical Association, called degeneration of the blood vessels 'the number one challenge facing the medical

profession today'
'Organized drives in support of cancer research,
the control of pollomyelitis rheumatic fever tuberculosis, and more recently diabetes, have been gen-be given to the challenge represented by the larger numbers of preventable fatalities, the result of a breakdown somewhere in the vascular system.

In my opinion the problem of vascular degener ation is the number one challenge facing the medical profession today Is there a common denominator underlying all of these conditions or does each one arise from causes peculiar to special situations? What variation is there in the pathology in the tissue preduposition, in the quality of the blood of individuals showing these conditions? Does heredity play a part? What influences do the stresses and strains

of modern existence play?

He added The time is at hand when the profession should do something about coronary disease before the final dramatic episode takes place. The

presence of advanced sclerosis might have been identified during careful physical examination with routine electrocardiographic studies. Individuals with hypertension and those addicted to overindulgonce may be classified as candidates for coronary accidents.

In preventing the deterioration of the blood vessels which brings about such accidents, Dr Bortz sug gested that proper diet may be a major factor said that the rodine compounds may be helpful, too

It has been suggested that the very low incidence of atherosclarosis in the population of Icoland is likely due to the common occurrence of iodine in the soil and food he stated On the other hand he observed, an overabundance of cholesterol in the dlet or even the moderate use of tobacco or alcohol may have bad effects on susceptible persons.

Probably the most important protective policy in maintaining an adequate vascular function is therapeutic rest. Dr Borts went on. Especially is this important in individuals suffering from hyper tension. The practice of a mid-day rest period one and one-half to two hours, with the person reclining and removed from bells and other annoyances of all kinds breaks the sustained drive of the daily routine More and more business concerns are making it possible for executives to divide the work day into two portions.

# RAGWEED DERMATITIS (ORAL DESENSITIZATION)

Benjamin J Slater, M.D., John L. Norris, M.D., and Nathan Francis, M.D., Rochester (From the Medical Department of Easiman Kodal Company, Kodak Park)

LTHOUGH ragweed is the most common A cause of hay fever in the United States, it rarely causes dermatitis like that seen after exposure to poison ivy, oak, or sumac The eruption is usually distributed on the exposed surfaces of the body, such as the face, neck, forearms, hands, legs, and feet, and may become general-The condition is not hereditary rule, those who get dermatitis from ragweed do not get hav fever or asthma

The first case reported appeared in 1918, and ten years later it was established that the ether extract fraction from the leaves and the pollen was responsible for the dermatitis, and that the patch test was the only way by which the diagnosis could be confirmed \*

The important factor in the diagnosis is its seasonal incidence and recurrence Symptoms usually appear in August and end with the frost. corresponding with the period of pollination of ragweed However, symptoms may appear as early as May, when the ragweed plant begins to grow, and may continue well up to November, as the ragweed plant maintains its vitality up to that Contact with the withering weed is possible until it is rotted by the snow Ragweed seed in the ground, if handled, may cause symptoms all winter

Symptoms may be present at other times, such as while hunting, weeding, gardening, or while handling hay or grain The symptoms may also be continued by pyrethrum, turpentine, vegetable oils, and industrial sensitizers

# Case Reports

Case 1 —L W, age 40, began to have dermatitis in August, 1940, when he was working as a gardener Eruption was generalized as far as he can remember and lasted all year He has had similar episodes each year since, which come about the same time of the year, starting in May and lasting until after the first of the year He is usually free from symptoms from January to May of each year

His family as well as personal history is negative for allergy Ragweed does not cause hay fever or

asthma in this patient

Turpentine fumes make it worse, as well as rainy weather A patch test with ragweed oil was mark-

Presented at the 141st Annual Meeting of the Medical Society of the State of New York Buffalo, Section on Indus trial Medicine May 8 1947

\*Slater B J Norms J L and Francis, Nathan Occup
Med Vol 2 No 4 (Oct.) 1946

edly positive. It was removed two hours after application because of intense itching

This patient took ragweed elegresin orally in 1946 His skin was normal that year

Case 2 -L B. age 53, was well until late summer of 1938 when he developed eczema of hands, scrotum, legs, and face He was seen by a dormatologist who found him very sensitive to ragweed, goldenrod, and metallic silver The condition cleared in the early winter, but recurred in October, 1939, clearing considerably in mid-November, but not to a degree permitting normal living It became much worse in October of 1940, and at this time, because of its persistence throughout the preceding year, it was thought that he might be sensitive to some of the chemicals with which he was working There was a positive patch test to one of these On November 1. 1943, there was a very severe flare-up of dermatitis following a hunting trip and a garden clean-up, where he had handled tomato vines In January, 1944, he reported that merely to be in the workroom caused his face, neck, and arms to burn, smart, and itch

He had been taking oral ragweed antigen for some months, but he didn't want to continue this as he would frequently get an acute flare-up of trouble if the dosage was not exactly right. His work was shifted to another area where the material used involved only dry gelatine, but even here the eruption persisted He was shifted again to a water purity control job where the only possible exposure was to small quantities of chlorine, but on September 13, 1945, there was the most acute exacerbation ever He was urged to go to the mountains where he improved very promptly and was nearly well when he returned home a month later The condition flared up promptly again so that hospitalization was neces-He returned to work December 10, 1945, still with considerable chronic eczema

### Discussion

These cases are of interest because they show the importance of recognizing ragweed dermatitis when it occurs in industry, as this type of dermatitis is not usually compensible In the first case (L W) the seasonal incidence and recurrence of the dermatitis corresponds with growth and pollination of ragweed, and the diagnosis is substantiated by a positive patch test to the eleoresin of In the second case (L B) it appears that ragweed is the primary cause of the dermatitis, with continuation of symptoms best explained by other factors, some of which may be connected with exposure to industrial sensitizers

#### Treatment

At present, the best advice to give a patient who is afflicted with ragweed dermatitis is to recommend that he go to a place where ragwood does not grow If this is not possible, because of low finances or other considerations, the treatment of choice is by oral description, using the ragweed oleoresin in corn oil. According to

Rudolf Baer, an assistant editor of the Year Book of Dermatology and Syphilology, this may be a safe and effective method of desensitization for rag weed, as well as it has been shown to be an ef fective method in some cases of poison ivy dermatitis. However, one must always be on the alert for flare-ups due to intolerance of the ragweed eleoresin, which may produce an acute execorbation of all the symptoms

#### THE AMERICAN SOCIETY OF ANESTHESIOLOGISTS INC

The following resolution was adopted by the board of directors of the American Society of An esthesiologists Inc., on June 11 1947 in Atlantic

City, N J
Whereas, the development and furtherance of

WHEREAS anesthesiology is a component part of the practice of medicine

Now therefore be it resolved

That the American Society of Anesthesiologists

Inc. recommends strongly

The establishment of departments of anes theslology in all medical schools and hospitals under the direction of a doctor of medicine ac-

tively engaged in the practice of anesthesiology B That the department of anesthesiology shall bear the same relationship to the medical

school and/or hospital as is borne by other medical departments of the institution.

And it be further resolved That the American Society of Anesthesiologists

Inc., disapproves

A. Of the training of persons other than doctors of medicino in the science and art of an esthesia for the assumption of responsibility in the care of patients where it may be necessary to exercise medical judgment, and particularly does it disapprove of the issuance of cortificates for

such training by its members.

B The existence of departments of anesthesial ogy in hospitals and/or medical schools under the direction of persons other than doctors of medi cine or under the nominal direction of doctors of medicine not actively engaged in the practice of anesthesiology

#### ADDED INFECTIONS IN BURNS

Dr L. Colebrook and his associates, writing in the March 15 1947 Lancet London, say that during a twelve months' period involving more than 1 400 dressings, cross infection by hemolytic streptococci Pseudomonas aeruginosa and Proteus vulgaris introduced while dressing burns has been almost entirely eliminated by doing the dressings in a dustfree atmosphere using a strict aseptic technic and using a penicillin-sulfathiasole cream as a routine application

During the same period a few added infections by these three organisms have occurred (33 in all), but most of these added infections oc-curred in patients whose burns had been imperfectly covered before they were redressed. The incidence of added infection in burns which were found to be imperfectly covered when they arrived for redressing was ten times as high (8.6 per cent) as that of the burns which had porfect cover throughout the poriod between dressings (0.8 per cent.) Among the 224 patients admitted without streptococcie infection, only 12 acquired this infection during their stay in the hospital and the clinical effect of these few added infections was practically nil. The problem of controlling added infections of burns with Staphylococcus aureus remains untouched. These infections which are numerous, may well play a prominent part in the slow healing of burns during the later stages of recovery —J A M A July 5 1947

#### COURSES OFFERED TO GENERAL PRACTITIONERS

Columbia University, College of Physicians and Surgeons, New York City, announces the following courses for general practitioners November 3 to 8, at the Roosevelt Hospital "Recent Advances in Allergy", December 15 to 20, at Mount Sinai Hospital, "Recent Advances in Gynecology", December 8 to 12, at Mount Sinai

Hospital 'Recent Advances in Neurology and

Paychintry

November 10 to 20 at Mount Sinai Hospital, Endocrinological Diseases December 1 to 6 at Mount Sinal "Venoreal and Skin Diseases, and December 1 to 23, at Mount Smai, Physi-ology of the Digestive Tract

# House of Delegates

# Minutes of the Annual Meeting

May 5 to 7, 1947

[Continued from page 2216, October 15 issue]

Sections 106-147 (Conclusion) appear in this issue For Subject Index, see August 15 issue, page 1799]

Afternoon Session Tuesday, May 6, 1947

Section 106 (See 55)

Report of Reference Committee on Report of Council—Part VII Medical Indemnity Plan (Genesee Valley Medical Care, Inc )

Dr. Denver M Vickers, Washington There are two resolutions that have been referred to your Reference Committee on which I should like to re-

Dr Leo F Simpson, of Monroe, introduced a resolution requesting the House of Delegates to endorse the Genesee Valley Medical Care, Inc., of Rochester, New York Your Reference Committee approves of this resolution and moves its adoption

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carned

Section 107 (See 56)

Report of Reference Committee on Report of Council—Part VII Medical Indemnity Plan (Central New York Medical Plan, Inc.)

DR DENVER M VICKERS, Washington Dr Leo E Gibson, of Onondaga, introduced a resolution requesting the House of Delegates to endorse the Central New York Medical Plan, Inc., of Syracuse, New York Your Reference Committee approves of this resolution, and moves its adoption

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

Section 108 (See 12)

Report of Reference Committee on Report of Council-Part VI Public Relations and Economics, Public Medical Care, Women Medical Students and Interns, Medical Service and Public Relations

DR EDWARD P FLOOD, Bronz Your committee has carefully studied the Report of the Council Committee on Public Relations and Economics and of its Subcommittee on Public Medical Care It commends the Subcommittee upon having secured a revision of the schedule of reimbursable charges of the State Department of Public Welfare, and it approves the two stipulations of the Council in granting its approval to these changes. First, that the schedule does not represent the full value of the medical services given, and second, that the difference between this schedule and the full value represents each physician's contribution to the needy persons

It is with regret, however, that the need for a charitable contribution by the physicians is still deemed necessary in these days of unprecedented prosperity When the TERRA was set up fifteen years ago, it was in a time of severe economic depression, and the medical needs of the large army of indigents could only be met by a sacrifice, on the part

of the medical profession, of its financial interest We hope that, when the present schedule is revised at the end of the year, consideration will be given to the fact that the physician should receive fees which are standard for similar services to the nonindigent The Reference Committee hopes that the preparation and publication of the new Manual of Medical Care will soon be completed

Your Committee has read the report of the Council Committee on Medical Service and Public Relations and noted that representatives of the Committee attend the meetings that deal with the topics of medical expense, indemnity insurance and medical care plans, the Murray-Wagner-Dingell Bill and the Hill-Burton Law, "home town" medical service for veterans, and proposed medical service for bituminous coal miners

The Reference Committee has studied the Report of the Joint Committee of the New York Hospital Association and the Medical Society of the State of New York, and hopes that this Committee will continue its activities in formulating mutually acceptable legislation

It is noted in studying the Report of the Council, Part VI, that no report was made by the Committee on Women Medical Students and Interns, but we note that the Planning Committee for Medical Policies has recommended that this Committee, which was set up at the time of the war emergency, be discontinued, and its functions transferred to the Committee on Public Health and Education

I move the adoption of this report

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

Section 109 (See 36)

Report of Reference Committee on Report of Council-Part VI Furnishing of Medical Service with Hospitalization Insurance

DR EDWARD P FLOOD, Bronx Your Committee has carefully considered the following resolution submitted to it as a Reference Committee and submitted by Dr Sol Axelrad, of Queens

"Whereas, the services of the pathologist, roentgenologist, anesthesiologist, and physical therapist are medical services, and

"Whereas, Blue Cross plans wrongfully offer these services to the public as benefits under hos-

pitalization insurance policies, and "Whereas, Associated Hospital Service, the Blue Cross Plan covering seventeen lower New York State counties, has refused to agree to dis-

continue this practice, therefore, be it "Resolved, that the Medical Society of the State of New York, through its House of Delegates, reaffirm its disapproval of such practice, and be it further

' Resolved, that the Society withdraw its en dersement of Associated Hospital Service or other Blue Cross Plan operating in New York State un less the practice of supplying medical service under hospitalization policies is discontinued

This resolution has been amended by the Refer ence Committee as follows

WHEREAS, the services of the pathologist roentgenologist, anesthesiologist and physical

therapist are medical services, and WHEREAS, Blue Cross plans wrongfully offer these services to the public as benefits under

hospitalization insurance policies and
WHEREAR, Associated Hospital Service, the
Blue Cross Plan covering seventeen lower New York State counties, has falled to discontinue this practice, therefore be it

'Resolved, that the Medical Society of the State of New York, through its House of Delegates, reaffirm its disapproval of this practice and there-

fore be it further

Resolved that this House of Delegates memorialize our representatives on the Board of Trustees of the Associated Hospital Service the United Medical Service and other approved medical service plans, to transfer the provision of these specialists' services to approved medical service plans. In furtherance of the alm of this resolution your Reference Committee introduces the following supplementary resolution

Subject Memorializing Local County Medical Societies to Disseminate Information con-

earning Violation of Approved Medical Service Policies in Their Own Communities.

"WHEREAS, certain evils are acknowledged to exist and correction theroof is recognized to be

nocessary therefore be it

"Resolved that this House of Delegates memorialize each County Medical Society to ad vise the Medical Boards and individual mem bers thereof of the importance of establishing in their hospitals the principle that the practice of pathology roentgenology, anesthesiology and physical therapy is the practice of medicine and not a hospital service and that they further request the Board of Trustees of their institutions to discontinue the inclusion of these medical services in any contract for hospital

I move the approval of this report and its substitute resolution.

The motion was seconded and as there was no discussion, it was put to a vote, and was unani mously carried

Section 110 (Sec 50)

Report of Reference Committee on Report of Council-Part VI: Care of the Chronically III

DR. EDWARD P FLOOD Bronz Your Reference Committee considered the resolution introduced by Dr Edwin L. Harmon of Westchester County sublect, 'Care of the Chronically Ill'

Whereas, statistics show that we have an aging population and therefore that the problems of gernatries must receive greater consideration in future planning and

Wheneas, studies have indicated that standards of care for the chronically ill in private nursing homes, now caring for many of the aged, are inadequate and for the most part very coetly and WHEREAS, the Governor's State Health Pre-

paredness Commission has recognized this need and has recommended the establishment of several small teaching hospitals for the treatment of the chronically ill, to be scattered throughout the State, and

WHEREAS, these hospitals cannot meet the present need but will serve as demonstration

projects now, therefore, be it "Resolved, that the Medical Society of the State of New York should interpret this need to the physicians and the public and should urge that the construction of separate buildings or special wings for the care of the chronically ill be included in the building programs of voluntary and public general hospitals throughout the State

The Reference Committee approves this resolu-tion and recommends that, until such projects can be consummated, efforts should be made for the re-habilitation of such of these patients as are indigents in their own homes by the provision of adequate medical, nursing and housekeeping care by public welfare agencies

I vote the approval of this report.

The motion was seconded and as there was no discussion it was put to a vote, and was unani mounly carried

Section 111 (Sec 24)

Report of Reference Committee on Report of Council—Part VI Practitioner in the Practice of Medicine

DR. EDWARD P FLOOD Bronz Your Reference Committee considered the resolution introduced by Dr Benjamin M Bernstein of Kings County, subject. 'General Practitioner in the Practice of Medi

"Whereas, the family doctor is the corner stone in the practice of medicine and

"Whennas, it is most urgent that the rightful place of the family doctor in the present and

luture scheme of modical service be retained and WHEREAS, the development and growth of pecialty boards are inimical to the best interests of the family doctor for whom no provision of certifi

ention or similar recognition is being made and WHEREAS, the acclaim given to the certified specialist in the hospital is rapidly tending to oust the family doctor from any position on a hospital

staff, and
WHEREAS, consideration being given to the establishment of group clinics likewise tends to the demoralization of the family doctor and

'WHEREAS, the incentive accorded the certified specialists for intensive preparation for certifica-tion and continued study is being neglected for the family doctor and

WHEREAS, the declassification of the family doctor in the estimation of the patient is to the detriment of the future of modical practice and WHHERAS it is to be noted that in this resolu-

tion the term used is family dector rather than

general practitioner; be it

Resolved, that a conference be called by the House of Delegates of the American Medical Association, consisting of representatives from the American College of Surgeons, American College of Physicians, the American Hospital Associa tion, and the various specialty boards, in order to plan the future of the family doctor in future practice and in hospital organization.

The Committee approves the sentiment of this resolution, but, in recognition of the fact that the

d

American Medical Association has recognized the term "general practioner" by its establishment of a Session on General Practice, it prefers to accept that designation of the family doctor

I move the adoption of this report

DR PORTER A STEELE. Ene I second the mo-

SPEAKER ANDRESEN Is there any discussion? DR BENJAMIN M BERNSTEIN, Kings A friend of mine, a cardiologist, was called on the telephone the other day and told by a patient, not a doctor, "Will you please come over as soon as you can? I He said, "Is that pain of yours only in front or is it in back, too?"

"Oh," she said, "I have no pain in the chest I have anging of the throat I did not want a cardi-

ologist at all I just wanted a doctor "

That is not funny, gentlemen In my humble opinion, and in the opinion of the American Medical Association and others more keenly interested, the future of the practice of medicine is in Just think of the number of specialists who are being turned out A man who gets an internship of one year, then a residency for two, or three, or four years, then takes his Board, is a specialist Well, those of you who are in country practice, and those of you who are old-timers in the practice of medicine, know that a man who has had three or four years of internship and residency cannot be called a specialist, yet he gets a diplomateship, and he puts himself up as a specialist. Then what happens? The next thing he goes to a hospital, and has the hospital adopt the plan whereby only those who are diplomates in particular specialties may be placed on the staff If a man is on that staff who has not a diplomateship, he cannot survive, he cannot progress, he cannot be promoted Well, that is one of the two horsemen who are after the family doc-One is the specialty board itself, the second is the hospital Finally, the third horseman, and the important one-perhaps you may not agree with me on this, but I am accustomed to that—is the growth of what we call group medicine

What is group medicine? We point to certain institutions throughout the country, particularly the one in the Middle West, as an outstanding example of the best kind of medical practice because it is a group clinic, a very outstanding group clinic Well, if a patient came to me, and I happened to be a gastroenterologist and a specialist, and not a general practitioner, and he had a pain in the belly, and also had something above the diaphragm, I would say, "I cannot take you You will have to go to the "I cannot take you You will have to go to the cardiologist" Then if you wanted to go a step further, if he went to the cardiologist, and the cardiologist said, "Where else have you a pain?" and he replied, "I have some pain in my back," the cardiologist would have to say because of that, "I cannot look at you You will have to go to the orthopedist" Gentlemen, the thing is becoming an absurdity and

very costly to the practice of medicine

I choose to use the term "family doctor" in all due respect to Dr Flood and the Reference Committee, because the family doctor is the one who has known the patient well We are talking about psychosomatic medicine today As you know, psychosomatic medicine is not anything new When you knew all about your patient, knew about his economic, social, and sexual life, you knew the patient well, and were able to tell him or her that the emotional storm. the emotional conflict, that occurred from time to time was the thing that was either aggravating the or-

ganic disease or was producing a symptom complex and had nothing to do with organic disease member, there are some people who come to us outside of the ones who are ill with infectious disease or ill with some other condition that can be treated by specific methods Seventy per cent of the others are psychosomatically disposed individuals who have symptoms which have nothing to do with organic disease

The mere fact that a man is a doctor does not mean that he always remains a doctor In connection with the change of a doctor to a specialist I am reminded of one story which will only take me thirty seconds to tell It concerns a man who came to a small town There was only one hotel in the town, and it had no room for him He begged and pleaded, and finally, because it was late in the night. the landlord was persuaded to let him in a room that had two beds in it and where a gentleman was al-ready sleeping. When he got up at six o'clock the following morning to catch a train, it was rather dark, so he did not make a light but hurned with his When he got to the street, a man came along and saluted him, and then another did the same thing He finally made the train, and when he looked down he found himself in the suit of a general, and he said, "What a darned fool the innkeeper is! I asked him to wake me up instead of the general"

The question was called, and the motion was put to a vote, and was carned

Section 112 (See 27)

Report of Reference Committee on Report of Council-Part VI Group Practice

DR EDWARD P FLOOD, Bronz Your Committee considered the resolution introduced by Dr Alfred M Hellman, of New York, subject, "Group Prac-

"Whereas, group practice is of increasing interest in the profession because of various prepayment plans which seek to encourage the practice of medicine in groups, and

"WHEREAS, there are no largely accepted principles governing the practice of medicine in

groups, and "WHEREAS, it is desirable that the American Medical Association supervise this development rather than forfeiting it to organizations not affiliated with organized medicine, therefore be it "Resolved, that the delegates of the Medical

Society of the State of New York instruct its delegates to the American Medical Association to prepare a resolution to that body that will bring about the provision of a bureau or council on group practice, the functions of such bureau will

(a) To serve as a clearing house of information on group practice throughout the United States

(b) To formulate professional, ethical, and other principles governing the development of such group practice

(c) And ultimately, at its discretion to provide for qualifications and recognition of groups engaged in group practice in the various parts of this country "

The Reference Committee recommends the adoption of this resolution in its entirety, and I so move The motion was seconded, and as there was no discussion, it was put to a vote, and was unani-

mously carried

DR. JAMES R. REULING (Treasurer) Might I make a statement and a request? The statement is having a very high regard for the intelligence of this House, and the whole House having heard all of the whereases read either yesterday or this morning, the Chairman of the Reference Committees read just a part of the resolutions containing the resolved clauses I make it as a suggestion or a motion, if you care to handle it in that way

SPEAKER ANDRESEN We will have it as a sug

Dr. FLOOD There is only one more resolution.

Dr. REULING I am not referring to your reference committee alone but to all others who will report from now on.

#### Section 113 (See 26)

Report of Reference Committee on Report of Coun cil-Part VI Group Practice

Dr. Edward P Flood, Bronz. Your Committee considered the resolution introduced by Dr Scott L. Smith, of Dutchess County, on group practice and recommends its favorable consideration by Council of the Medical Society of the State of New York

"Wheneas, the complexity of medical knowl edge makes necessary close cooperation of practicing physicians and pooling of their various skills

"Whereas recent ensetment of laws in this State make legal provision for such combinations and associations in the practice of medicine in the several specialties, and

"WHEREAS possibilities of ethical abuse under such legal permission are not inconsiderable, and

"WHEREAS, further enactment of law broadens the conditions under which corporations and associations of laymon may employ physicians in furnishing medical care for their subscribing mem-

bers, therefore be it

Resolved, that the Council of the Medical
Society of the State of New York be requested to furnish in as much detail as possible the partner ship and group practice regulations, financial agreements and permissible participation with laymen under which the members of Organized Medicine may practice their profession.

I move the adoption of this portion of the report. The motion was seconded, and as there was no discussion it was put to a vote and was unani mously carried.

Dr. Floor I now move the adoption of the report as a whole signed by the following members, Goodwin A. Distler, Stephen H Curtis C. A. Prudhon, Porter A. Steele and Edward P Flood, Chairman

The motion was seconded, and as there was no discussion, it was put to a vote, and was unani mously carried.

SPRAKER ANDRESEN Thank you Dr Flood!

Section 114 (See 22)

Report of Reference Committee on New Business A Distribution of Medical Care

Dr. Leo F Shirson, Monrot. Resolution introduced by Dr. Reginald A. Higgons of Westchester concerning 'Distribution of Medical Care

"Whereas, the proper distribution of medical care is one of the major problems to be solved by present-day Organized Medicine if bureaucratic controls over medicine practice are to be avoided

"WHEREAS, since the war there appears to have been a trend towards even greater concentration of medical practitioners in the large urban and suburban areas, now, therefore, be it

"Resolved, that the Medical Society of the State of New York shall collect information from each County Society yearly and shall maintain an upto-date registry which will enable prospective practitioners of medicine to determine with greater accuracy which communities in the State have need for their particular type of service and which communities already have adequate medical care. and be it further

'Resolved, that the existence of such a registry shall be publicised through the NEW YORK STATE JOURNAL OF MEDICINE, the faculties of all Grade-A medical schools, and the chief of staff of each hospital approved for intern training in the

State of New York.

Your Reference Committee believes that the pur pose of this resolution will be adequately served by the issuance of the Medical Directory of the State of New York within a few months, and that the establishment of such a registry would be an unnecessary expense to the Society

We believe also that this type of information is rarely sought by prospective practitioners and that the stimulus for them to do so should originate in the medical schools and hospitals

Your Committee suggests that the Medical Society of the State of New York, through its publica tions and by any other available means, solicit the cooperation of the medical schools and hospitals in this matter

Your Committee recommends that this resolution be referred to the Council for consideration and

action, and I so move

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

#### Section 115 (See 25 77)

Report of Reference Committee on New Business A: Specialty Board

DR. LEO F SIMPSON Monroe. Concerning the alternate resolution introduced by Dr LaGattuta, of the Bronx, subject Specialty Board, 'and read-

"WHEREAS, it is the policy and sim of the American Medical Associaton to foster affiliations of all physicians with a hospital in order that they might continue their education and increase their efficiency and

"WHEREAS, interference in doctor hospital relationship is influenced by the indirect action of the

various specialty boards and

WHEREAS, on account of the numerous complaints from returning veteraus being unable to qualify for the board on account of a lack of available and acceptable residencies and

"WHEREAS this condition is prevalent through

out the country, therefore, be it

Resolved, that delegates of the Medical Society of the State of New York be directed to memorial ize the House of Delegates of the American Medical Association at its forthcoming June meeting in Atlantic City that the Board of Trustees be requested to appoint a committee for the purpose of investigating the Hospital-Specialty Board relationship, and to take whatever means necessary to correct the situation.

Your Reference Committee approves this resolution and recommends its adoption. I so move

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

Section 116 (See 35)

### Report of Reference Committee on New Business C Podiatry

DR. THEODORE J CURPHEY, Nassau Concerning the resolution on podiatry introduced by Bronx County, this resolution deals with the attempt on the part of podiatrists to pass legislation in this State to extend the limitations of their licensure to include the treatment of systemic disease as manifested in lesions of the lower extremities and requests that the Medical Society of the State of New York place itself on record as being opposed to such legislation, and further, that the Governor and members of the Senate and Assembly and also the Board of Regents of the State of New York be sent copies of this resolution

Your Reference Committee has studied this resolution and is entirely in accord with the principles outlined therein, and is of the mind that this matter be referred to the Council Committee on Legislation in order that more vigorous opposition to any proposed legislation in this connection shall be fostered directly by the New York State Society

Your Committee further feels that the Committee on Legislation, its Executive Officer in Albany, and all other Committees of the Council should be constantly alert to the threat of the extension of the activities of this group, with their resultant encroachment upon the regular practice of medicine, and should be prepared at all times to take prompt action toward preventing this group from broadening their activities to the detriment of the health and welfare of the people

I move the adoption of this portion of the report DR. CLARENCE G BANDLER, New York I second

the motion.

SPEAKER ANDRESEN Is there discussion?

DR SAMUEL Z FREEDMAN, New York Read the resolved part so we know what you are talking about

(At this point Dr Harry Aranow spoke, and later on, upon motion which was duly made, seconded and carried, was given permission to delete it from the official minutes )

Dr. FREDERICK W WILLIAMS I am sorry that Dr Curphey did not read all of our resolved's contained in that resolution. The last resolved carried that reference to the Board of Regents I would like to read that last resolved

"Resolved, that the content of these resolutions be made known to the Board of Regents of the State of New York"

We have in our folder, and have showed to the chairman of the Reference Committee copies of the State examination in podiatry The first question was, "How do you make a diagnosis of diabetes?" We have a handbook also of this Institute of Podiatry and in it they have listed that they give a course in the diseases of metabolism and other medical conditions I think they are far overstepping the rights granted to them under the Practice Act of Podiatry, which says they can treat diseases of the feet only as far as the deep fascia

I think this portion of the report of the Committee is quite acceptable except that they should include some recommendation to the Board of Regents, and I would like to move an amendment to this report that they also include that a copy of the resolution be

forwarded to the Board of Regents as well
Dr. Curphey That will be acceptable to the Reference Committee

The resolution referred to is as follows

"Whereas, podiatry is a technical minor

adjunct of orthopedics, and
"Whereas, many major systemic diseases have manifestations in lesions of the lower extremity.

"WHEREAS, the Institute of Podiatry is not a

medical school, and

"WHEREAS, the licensed podiatrists have been active in attempting to pass legislation in this State to extend the limitations of their licensure to include the treatment of systemic disease, and

"WHEREAS, the treatment of disease constitutes the practice of medicine under the laws of this

State, and
"Whereas, the passage of such legislation would be detrimental and hazardous to the public health and welfare, therefore, be it "Resolved, that the Medical Society of the

State of New York put itself on record as being opposed to such legislation, and be it further

Resolved, that the Governor and members of both Senate and Assembly be sent copies of this resolution, and be it further

"Resolved, that the Legislative Committee and our Albany representative be instructed to govern themselves accordingly, and be it further

'Resolved, that the content of these resolutions be made known to the Board of Regents of the State of New York."

The question was called, and the motion as amended was put to a vote, and was unanimously carried

Section 117 (See 91)

Report of Reference Committee on New Business C Training of Medical Technicians

DR THEODORE J CURPHEY, Nassau On the resolution introduced by Dr Alexander Newlands, of Westchester, reading

"WHEREAS, it is self-evident that an essential element of good medical care rests in a large degree upon conscientious and well-trained medical technicians, and

"Whereas, very few colleges or universities in this State offer suitable educational programs for the training of medical technicians, now, there-

fore, be it "Resolved, that the Medical Society of the State of New York memorialize the colleges and universities of the State, urging them to establish a four-year curriculum for the training of medical technologists, including a minimum of one year of supervised practical experience in an approved hospital and which will lead to a degree in Medical Technology, and be it further "Resolved, that consideration be given to a

limited program consisting of one year in basic courses and one year of practical hospital training in which certification may be granted as a junior

grade medical technologist'

The Committee has studied this resolution from Westchester County and recognizes the need for elevating the educational and technical qualifications of the nonmedical laboratory worker, and for that reason approves in principle the intent of the resolu-

The Committee further feels that the matter re-

quires detailed study and would recommend that it be referred to the Council, urging them to investigate the problem with the aid of those educational and medical organizations having a similar interest to wit the New York State Society of Pathologists the Joint Council of Radiologists Pathologists Anes-themologists and Physiotherapists as well as the Board of Registry of the American Society of Clinical Pathologists and the New York Academy of Medicino.

I move the adoption of this report.

Dr. J Lewis Amster, Bronz I second the motion.

SPEAKER ANDRESEN Is there any discussion? DR. ERRA A. WOLFF, Queens Mr Speaker and Gentlemen of the House I rise to comment on the action of this Committee I support it, but I want to take this opportunity of drawing to the attention of the House the importance of considering economic matters in relation to some of the specialties of medicine. The reason medical laboratory technicians standards have deteriorated to the lower degree that they have reached is the fact that in hospitals the pathologists are considerably limited in their use of budgetary means. As a result they have been forced to offer these technicians a poor salary As a consequence, a lot of fly by-night schools have arisen, particularly in the metropolitan area, that are now exploiting veterans' benefits. The only way to attack this problem is to support the hands of the pathologist and that has already been taken care of by Dr Flood's Committee Dr Curphey in proposing that this be referred to the Council, where it will probably get some action, should be supported In that way we may get some action initiated on a State level that will make for the solution of this problem, but we must not lose sight of the fact of the fundamental difficulty behind all of this, namely that hospital superintendents offer starvation wages to these presumably highly skilled technical per sonnel.

SPEAKER ANDRESEN Is there any further discussion?

Da. ARTHUR A. FISCHL, Queens. The only question I wanted to raise was whother by insisting they take a four year course it might not be a factor that will discourage and prevent people from studying this subject?

DR. CURPHEY I think I might be able to clear the matter up We have just accepted this resolution in principle. The Committee does not approve of the actual wording of the resolution, especially in respect to the time involved in the training of these technicians

The question was called, and the motion was put to a vote, and was carried.

SPEAKER ANDRESEN Thank you Dr Curphey!

Section 118 (See 87)
Report of Reference Committee on Report of Council—Part XII Nursing—To Provide a More Adequate Supply of Hospital Nurses

Dr. Joseph A Geis, Esser. This resolution was introduced by Dr. McGarvey of Westchester

County, on the subject of nursing

WHEREAS, there is a nation-wide nurse shortage of alarming proportions with recently compiled statistics indicating a national deficit of 40 000 nurses 16 per cent of the hespitals in the United States with closed beds and 33,000 beds in our hospitals unavailable because of the nurse shortage and

WHEREAS, in the month of April in New York

State hospitals reported 1 831 closed beds and waiting lists of 8 403 patients primarily because of nurse shortages, and

WHEREAS the national enrollment of 31,000 students in approved schools of nursing in 1946 was some 13 000 fewer than the schools sought and approximately 40 per cent fewer than the 1945 enrollment and

"Whereas, this trend and the actual shortage are of serious concern to the nation s health and

'WHEREAS the use of the bedside worker trained to perform many routine tasks in the case of bed patients in hospitals have been proved by wartime experience in both military and civilian hospitals to be an acceptable expedient to supplement the services of available graduate professional nurses to the advantage of the patient's care and "Whereas the New York State Board of Nurse

Examiners while licensing practical nurses with requisite training and qualifications prohibits the training of practical nurses in any hospital maintaining a school for the training of graduate

professional nurses, and
Wheneas the best facilities for the training of those concerned with the care of the sick are generally to be found in those hospitals with

approved schools of nursing and "Wheneas, short orientation courses for socalled attendants or nurses-aides do not appear to offer a satisfactory solution to the problem of better and more adequate bedside care now therefore be it

'Resolved, that the Medical Society of the State of New York go on record as endorsing an exten-sion of the training program for practical nurses in addition to its continued efforts to increase the available supply of registered professional nurses and be it further

Resolved that the Medical Society of the State of New York, in cooperation with the State Board of Nurse Examiners and the New York State Hospital Association, seek liberalization of the inter-pretation of existing laws so as to permit the training of practical nurses in all hospitals now con ducting training schools for registered, professional nurses and be it further

Resolved that the Medical Society of the State of New York urge the establishment of training programs for practical nurses in approved hospitals not at present conducting a nurse train

ing program of any sort and be it further "Resolved, that the American Medical Association be petitioned to take similar action urging similar steps nationally with the offer of active cooperation with other national bodies concerned with the training of nurses.

Your Reference Committee approves this resolu tion, and I so move.

DR. HOMER J KNICKERBOCKER, Ohlario I second the motion.

DR. SAMUEL Z FREEDMAN New York. That was for the approval of the resolution?

SPEAKER ANDRESEN 1 cs Is there any discussion on the motion of the Reference Committee which is to approve this resolution?

Assistant Segretary Freet In discussing this while I am in favor of it, I would like to call to the attention of the House the fact that at a meeting in Buffalo eighteen months ago the House of Delegates authorized, and I quote, the establishment of an independent coordinating board representing nurs-

ing hospital administration, and medicine the delegates being authorized, subject to the governing

bodies of each representative group, to outline broad policies of cooperation," etc. Such a board has been set up with our Council Committee on Nursing as one of the integral parts, with representatives of the hospital administrators, nurses and practical nurses, and where many of these problems are now under consideration

I think the membership of this House should realize that, and resolutions of this kind might well

be referred to that committee for its action

The question was called, and the motion was put to a vote, and was unanimously carried

Section 119 (See 86)

Report of Reference Committee on Report of Council—Part XII Practical Nursing

DR JOSEPH A. Geis, Essex Resolution introduced by the Orange County Medical Society, reading

"WHEREAS, the availability of properly trained nurses is obviously inadequate to accomplish hospital and private home requirements, and when available such services are costing beyond the financial capacity of the majority of patients,

"Whereas, an estimated two thirds of the population of the county desire and need simple nursing and housekeeping assistance during illness such as is customarily rendered by acceptable practical nurses at charges commensurate with

average family income, and "Whereas, acceptable practical nurses can be developed through approved training schedules covering essentials of nursing care, either in recognized hospitals or under personal guidance of practicing physicians, and such practical nurses can and do become able assistants to physicians within the financial capacity of the

average family, and
"Whereas, New York State—Chapter 472 of
the Laws of 1938—amending the Education Law, has prohibited Practical Nursing except by trained graduates of nine months' instruction at special schools, and in view of the request of the Board of Regents that the law be repealed, has almost wholly failed to produce a sufficient number of practical nurses and clearly seems to be

against the public interest, and

"WHEREAS, all the other states of the Union permit practical nurses to function under the supervision and responsibility of the practicing physician, and twelve of them have abandoned compulsory licensure, therefore, be it

"Resolved, that the Medical Society of Orange County request the Medical Society of New York State to take action leading to the repeal of this law"

The present law was introduced by the State Nursing Association and endorsed by the representative committee chairmen of the various county The operation of this law has medical societies been postponed each year since its passage due to war conditions Therefore, this Reference Committee thinks it has not been given a fair trial and disapproves of this resolution at this time

We would suggest, however, that the Council Sub-Committee on Nursing consider the advisability of action at some time in the future

I move the adoption of this report

DR V LEONARD WILLIAMS, Kings I second it SPEAKER ANDRESEN Is there any discussion on the motion to adopt the report of the Reference Committee, which carries with it disapproval of the resolution?

DR M R BRADNER, Orange The resolution has for its purpose the amplification of the previous resolution to provide training courses for practical nurses in all approved hospitals, so that they may receive their training near home and get on the job in a hurry, thus providing us with practical nurses which we need because of the real dearth of trained This 1938 law, however, makes it compulsory for these pupil nurses to receive their training at certain specified points set up for that purpose It encourages the younger women to take the courses and discourages the older women from doing so The only state in the United States today that is even considering a compulsory registration of practical nurses is New York State, and they have held the enforcement of that law in obeyance now since 1938, during which time the courses that have been given have been such that the State Regents has suggested the repeal of the law as being detrimental to the production of practical nurses

Our resolution was intended to expedite the actual training of practical nurses by rescinding this law which hampers the whole procedure, and has as its purpose the abolishment of the law and the removal of this threat of compulsory registration and the providing of training courses for practical nurses

in hospitals near their homes ASSISTANT SECRETARY FREY This is a matter that the Council Committee on Nursing and this Coordinating Board on Nursing Problems have considered at length The present requirements under this law that Dr Bradner would like to see repealed are for nine months' courses of training minimum for practical nurses, of which three months are to be didactic and six months are to be in training schools It is recognized that there are not of some sort enough training schools for practical nurses, and that their distribution is not good. There are none here in the western end of the State There is one in the Albany region but none in the northern part of the section

I think, however, it would be a mistake to lower the standards any more than they now are This law about the registration of nurses becomes mandatory next year, and of course it will not be retro-active. Those that are now practicing will be allowed to continue to practice. Therefore, the allowed to continue to practice Therefore, the recommendation of the Reference Committee can well be supported

SPEAKER ANDRESEN I will recognize Dr Smith, but I have been asked to request Dr Lochner to dis-

cuss this as soon as Dr Smith is through

Dr. Scott Lord Smith (District Delegate) I feel a very strong sympathy for Dr Bradner in his It was my impression of the law when resolution it was first proposed and later enacted that it would not supply an adequate number of so-called practical nurses for the reason that, in our district at least, the bulk of women who call themselves practical nurses are women who for some reason or another have had to change their manner of life For the most part they have had to support themselves later in life They have had some experience in their own homes, most of them are married women and know a little bit about taking care of people, and they furnish a very acceptable means of taking care of the sick. That law, it stands now, only allows people to become practical nurses who take a special course Most of these women who supply the bulk of the work that is done in Dutchess County, for instance, have not the time nor the financial capacity to take

such a course. They are further along in life. There is no incentive, particularly to the younger women. to take such a course. They can make more money doing something else and they don t want to take that length of time to do that work. We have any number of women who come under the so-called waiver year after year, and if we can get more people who can do the same thing, or unless some radically different way of supplying nurses is considered, the hideous shortage of practical nurses, in my judgment, is going to be continued.

SPEAKER ANDRESEN Dr Lochner will you en

lighten us for a moment about this?

DR. JACOB L. LOCHNER, JR. Mr Speaker, the Board of Regents suggested that the act licensing practical nurses be repealed in order to see what the situation was There was a hearing held in Albany before the Board of Regents on this, and the room was packed with representatives from nursing organizations and the State Medical Society was represented by Dr Anderton and Dr Hannon, and it was the opinion of the majority at that meeting that no repeal should be instituted at the present time. Therefore, the Chancellor of the Board of Regants appointed a committee to study this situation and report back in a few months.

Is that what you want?

SPEAKER ANDRESEN 1es
DR. THOMAS A. McGOLDRICK (Past President)
And he did appoint such a committee?

DR. LOCHNER Yes.
DR. McGoldrick Who are they?

DR. LOCHMER I don't know
DR. ANTHUR A. FISCHI, Queens Dr Frey made a
statement to the effect that this was not to be
retroactive. There was some question in my mind as to whether this is retroactive or not because it has been brought to my attention that a number of practical nurses who have been working in institutions are very much afraid that they will lose their positions if they are not already certified. I would like to ask Dr Frey if he knows definitely whether or not this is retroactive.

ASSISTANT SECRETARY FREY I don't know SPEAKER ANDRESEN The motion is the adoption of the recommendation of the Reference Committee which disapproves of the resolution. An affirmative vote means that the resolution of Orange County is

disapproved.

The motion was put to a vote and was carried.

Section 120 (See 78 72)

Report of Reference Committee on Report of Planning Committee for Medical Policies Group Prac tice and Partnership

Dr. Thomas M. D Angelo, Queens The following resolution introduced by Dr. Aaron Kottler of Kings County dealing with Group Practice and Partnership was referred to this Reference Committee for study

"Wheneas, the New York State Legislature enacted Senate Introductory 740 Printing 2142 in the 1917 Legislature which is now a chapter of the laws of 1917 of the State of New York and

"Witereas said law amends the Education Law in relation to the practice of medicine by physicians as partners and permits the pooling of fees and monies for medical services by the members of the partnership or group and employees of such Partnerships or groups, and WHEREAS, said bill does not specify or limit

the number of partnerships or groups to which an

individual physician may belong and
Wheneas under the present bill, a physician might be a member of more than one group and use this as a subterfuge for fee splitting, and also create a situation where said member of more than one partnership might be tempted to render services for less than the agreed fee among the

group and "WHEREAS, said bill permits a division of the fees with an employee who does not necessarily have to be a physician under the terms of the bill,

therefore, be it

"Resolved, that we request that legislation be introduced in the 1948 session of the New York State Legislature amending the recently enacted law concerning group practice or partnership, and incorporating therein provisions or amendments to correct the foregoing objections

At this morning a session your Reference Committee covered the proposals embodied in this resolution

"The Committee notes the enactment into law of bills to permit physicians to practice in partnership and to pool fees, and to allow on the provisions of IX-C of the Insurance Law, the employment of physicians by nonprofit medical indemnity and hospital service corporations to treat persons in-sured by them. The State Society opposed this legislation because we felt that the bills were loosely drawn and opened up avenues for flagrant violations of medical ethics and that would be contrary to the best interests of the people Reference Committee endorses the recommenda tion of the Planning Committee that the House of Delegates authorize the Council to have drafted suitable legislation to cover the matter of partner ships and group practice within the principles already approved by the State Society

Your Committee feels however that this resolu tion can be approved in order to reaffirm our stand in

this matter I so move.

The motion was seconded, and as there was no discussion it was put to a vote, and was unanimously carried.

Section 121 Report of Special Committee to Review the Principles of Professional Conduct with Reference to

Advertising

SPEAKER ANDRESEN I would like to call on Dr Charles N Allaben, who has been waiting for a long time to be recognized. Dr Allaben is reporting for the chairman of the Special Committee that was appointed by this House a year ago to review the Principles of Professional Conduct Dr Brennan is

the chairman, and he could not come.

DR. CHARLES N ALLABEN (Councilor) Thomas M Brennan, the chairman, was to give this report, but he was detained in Brooklyn, so I will give this report that came this afternoon after

lunch "At the annual meeting of the House of Delegates held in October 1945 a resolution was passed as follows

WHEREAS, Section 31 of the "Principles of Professional Conduct of the Medical Society of the State of New York falls to specify precisely what may properly be stated in the advertisement or announcement of a book, article or other publication written by a doctor for the laity therefore be it

"Resolved, that a special committee be appointed to study this problem and formulate such necessary amendments as the committee deems advisable"

"Your Committee has discussed this problem in an effort to formulate amendments that will cover only what can be stated in an advertisement or announcement of a book, article, or other publication written by a doctor member of our Society for the laity. The Committee finds it practically impossible to formulate an amendment or amendments which would cover all and every question as to what should be stated in the announcement of any book, article, or publication that any member of the Society might wish to publish or print. It seems, however, quite feasible to require that the proposed advertisement or announcement, as well as the book, article, or other publication, be submitted for review to a Council committee and passed upon prior to publication. The Committee recommends the following resolution

"Members of this Society who have prepared and written a book, article, or any writing pertaining to medicine, for the laity and intended for publication, shall submit the same to the Council Committee on Public Relations and the Public Relations Bureau of the Medical Society of the State of New York for approval prior to any publication thereof In the event the book, article, or writing shall be so approved for publication, then and in that event any proposed advertisement for or announcement of publication thereof shall be likewise submitted to the said Council Committee and Bareau for approval prior to any appearance thereof in print The reviewing committee shall render its opinion without unnecessary delay This Committee shall be in the main guided by Section 31 of the 'Principles of Professional Conduct' but shall be empowered to make such concessions as may be practiced and neces-sary in considering the title of the publication, the description of the content, the responsibility, standing, and reputation of the writer and such other material through which the publisher wishes to arouse reader interest "

I move the adoption of this report The motion was seconded

SPEAKER ANDRESEN Is there any discussion? DR. BENJAMIN M BERNSTEIN, Kings The Committee on Public Relations of the Kings County Medical Society about three weeks ago had two subjects sent to it for approval. After reading the Code of Ethics very carefully, we decided, regardless of what the content of these articles or what have you. are, that if we follow the Code of Ethics of the State Society-and we must follow that-we have no choice but to refuse to permit any publication of any book or any article in the lay press or the appearance before the radio of any man when he is introduced as being Doctor X-Y-Z, associate professor, or clinical instructor, or what have you, of any organization, because the Code of Ethics says explicitly no doctor shall advertise to the laity by word of mouth, or letter, or radio, or what have you, in such a way as to call attention to himself as a doctor words, he cannot have his name mentioned in connection with what he does in the practice of medicine to draw attention to himself We cannot possibly censor these articles as far as the present Code of Ethics is concerned, so there must be a change in the content of the Code of Ethics

The question was called, and the motion was put to a vote, and was unanimously carried

المسادين

Section 122

Report of the Reference Committee on Report of Council—Part V Rehabilitation and Rural Medical Service

DR A. N SELMAN, Rockland Your Committee on Rural Medical Service, under the chairmanship of Dr Dan Mellen, of Rome, functioned to plan for improvement in rural health, and made themselves available for conference and advice to the American Farm Bureau Federation The Committee also worked with a Committee on Veterans' Postwar Affairs to help fill vacancies in rural communities Members of the Committee represented New York State in the National Conference on Rural Health, held in Chicago in March, 1946, ably attesting to the national organization that New York State is actively interested in the betterment of medical care in rural areas. The activities of this committee are commended, and your Reference Committee advises that this committee be continued. I so move.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unani-

mously carried

DR SELMAN The Subcommittee on Rehabilitation, under the chairmanship of Dr O W H. Mitchell, of Syracuse, developed a close and extremely valuable liaison with the Bureau of Medical Rehabilitation, the State Department of Health, the Division of Vocational Rehabilitation of the State Education Department, and the State Department of Social Welfare They should be commended for their efforts and success in effecting this cooperation, and your Reference Committee recommends that this Committee be continued

I move the adoption of this portion of the report The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

• DR SELMAN Now I move the adoption of the report as a whole

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

SPEAKER ANDRESEN It is now five o'clock. Shall we go on for another hour or so, and see what we can clear up, so there will be a minimum of business left over for to prove more than the same seems.

over for tomorrow morning? Chorus Yes, continue!

Section 123 (See 6)

Reference Committee on Reports of the Treasurer, Trustees, and Finance Committee

Dr. John D Naples, Eric Referring to paragraphs one and two of the Supplementary Report of the Board of Trustees, which read as follows

"1 That a business survey be made of the greatly extended activities of the Society during the past eight years by a competent firm or other qualified persons, such firm or persons to be chosen by the Council or a Committee thereof, appointed by the President of the Society, subject to the approval of the Board of Trustees, and under the direction of the Council, in order that the efficiency of the Society be increased, the relationship of expenditures of various departments to the over-all efficiency of the Society be evaluated, and such changes be made in the administration of the affairs of the Society by the Council upon the recommendations made in the report submitted after survey, subject to the approval of the Board of Trustees, as to the entailed expenditures only

"2 That a new committee of the Council be

created entitled the Committee on Committees, to be composed of the Chairman of each of the Council Committees, the President, the President Elect the Past-President, and two additional members to be appointed by the President with the approval of the Council. This Committee would act to coordinate all of the functions of the Council Committees so that unnecessary over lapping of functions would be diminished integra tion of all of the work of the Society be made more efficient, and unnecessary expenditures be less-

As to the foregoing paragraph, your Reference Committee recommends that the House of Delegates approve the principle of conducting the management and administrative affairs of the Society in the most efficient manner possible It is recommended that the House of Delegates refer these matters to the Council the constituted committees, and the Board of Trustees for study and such action as may be

deemed appropriate.

The Reference Committee moves the adoption of

its report as to paragraphs 1 and 2.

The motion was accorded and as there was no discussion, it was put to a vote, and was unani mounty carried.

DR. NAPLES Referring to paragraph three of the Supplementary Report of the Board of Trustees, which reads as follows

It is further recommended that careful consideration be given by the House to the fact that in the very near future the activities of the Society limited as they must be by our Dues In-come, must of necessity be directly designed on the annual assessment of the members increased The Board desires to bring to the attention of the House the fact that the per capita dues of this Society are the lowest of those of any of the other State Societies of the United States comparable to the total State population or the total number of members of these Societies. A list of these Societies will be furnished the House in the Report of a Committee of the Council.

The Reference Committee does not have sufficient knowledge on this subject to make a specific recommendation. However the Committee does believe that an increase in the State assessment is definitely needed to compensate for rising costs of operating the State Society's activities

The Reference Committee recommends that the matter of increased dues be referred to the Council and Trustees for study during the ensuing year and that they be prepared to submit to the next meeting of the House of Delegates a definite recommendation on the subject.

The Reference Committee moves the adoption of

its report as to paragraph 3
DR. JAMES R. REULING (Treasurer)
Gentlemen, I rise to make a substitute motion for this reason If this is referred to the Council and the Trustees for study it is going to be 1949 before we can get an increase of dues. I, therefore offer a substitute mo-tion that this House of Delegates approve an assessment of \$15 for the year 1948.

The motion was seconded by several PRESIDENT BAUER I think you will recall that in my report I recommended that the dues be increased. The Committee took no action on it, I think properly, because this other committee had the same subject under consideration. I would agree with Dr Iteuling that if we put it over it will be 1049 before we can get any increased income. Already

the State Society is operating beyond its dues income and although we have been very fortunate during the war to stay in the black, the past year there was a slight deficit. It is true that the exten sion of the time in which the men coming back from service to have their dues remitted will soon be up probably by the end of this year and our income will be somewhat increased it still will not be enough to carry on our activities We have got to do one of two things We have got either to increase our dues. or we have to cut down our activities. I submit to you gentlemen that now is no time to cut down on our activities. We have approximately 21 000 members in the Society That brings in an income of \$210,000 The budget which was submitted to the Council and by the Council to the Board of Trustees for 1947, amounted to about \$230 000 which is \$20 000 more than our estimated dues income, and out of that there will be some remissions of dues too It is true that usually our budgets are in excess of our actual expenditures but I think in all probability our expenses this year will again exceed our dues in come, and I would like to second Dr Rouling's motion to substitute for the Committee s report a motion that our dues be increased commencing January 1, 1948 to \$15.

Dr. Januar F Roover (Trustee) Mr Speaker

and Gontlemon of the House, I am very glad indeed to have this matter brought before you because I have listened with great care to the amount of additional work, which is going to require additional expenditures, that has been thrown upon the ad ministration of this Society by your actions today on these matters that you have referred to the Council. I should estimate that in all probability in order to carry out your wishes as expressed in your actions today, there will be an additional expenditure of at least \$25 000 to \$45 000 entailed in relation to the expense of the various committees and aubcommittees of the Council that will have to carry on this work. I feel that we are going to have a need of this money now not in 1949 unless we are going to have to sell cortain of our investments at a loss in the present market.

I desire to second in every way the motion made by Dr Reuling, and I hope you will see the necessity of this measure contiemen, and that you will vote that we may be able to secure this money beginning at least with the annual dues of 1948.

SPEAKER ANDRESEN If there is no further discussion, the motion is to substitute Dr Reuling s motion for the motion of the Committee, which is in offect an amendment.

Themotion was put to a vote and it was carried.

SPEAKIR ANDRESSIN We now have the motion that was substituted for the original motion before us Is there any further discussion?

The motion was put to a vote, and was

carried.

DR. NAPLES The Committee has reviewed the report of the Treasurer with approval and recommends that it be accepted as presented. Reference Committee moves the adoption of its report on the Treasurer s report.

The motion was seconded, and as there was no discussion, it was put to a vote and was unani

monely carried.

DR. NAPLES With respect to the report of the Finance Committee regarding the war memorial of the Society which is a proposal for the Society to finance the advanced education of the children of its members who died in military service during World War II your Committee feels that this can

only be financed by a special assessment for this pur-Your Committee recommends that this matter be referred to the Council and Trustees for further study as we have no factual or actuarial knowledge as to its present or ultimate costs

The Reference Committee moves the adoption of its report on the Finance Committee's proposal for a

war memorial.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

Dr. Naples Now the Reference Committee moves the adoption of its report as a whole, with the

substitution.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

Section 124 (See 85, 79)

Report of Reference Committee on Report of Council—Part X Workmen's Compensation—Medical Practice Committee

DR. F. W. HOLCOMB, Ulster Before presenting the report of the Council, Part X, on Workmen's Compensation, there are three resolutions that I would like to present and have your endorsement on Two of these resolutions are identically the same One of them was introduced by Dr Dwight V Needham, of Onondaga County, and the other by Dr Aaron Kottler, of Kings County These are, as I said, almost identical in wording, and I will leave out the whereases and read just the resolved part

"Resolved, we request that the Council of the Medical Society of the State of New York, through its Committee on Legislation be instructed to prepare and introduce legislation calling for the abolition of the Medical Practice Committee and the restoration of its functions to the respective county societies"

The other one reads

"Resolved, we request that legislation be intro-duced in the New York State Legislature in the 1948 session to restore to the county medical societies of Greater New York the powers which they had under the compensation laws in 1935"

Your Reference Committee recommends approval

of both of these resolutions, and I so move.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

Section 125 (See 89)

Report of Reference Committee on Report of Council-Part X Request for Opinion Regarding Compensation Ratings of Physicians

Dr. F W Holcomb, Ulster On the resolution introduced by Dr Porter A. Steele, of Erie, subject, "Request for Opinion Regarding Compensation Ratings of Physicians," and reading

"WHEREAS, the 1947 State Legislature enacted a law which permits the Chairman of the Work-men's Compensation Board to review and revise the compensation ratings of physicians, and "Whereas, the Chairman may use this power

to revise ratings granted before the effective date of this new law, therefore, be it "Resolved, that the counsel of the Medical Society of the State of New York be called upon to render to the physicians of this State a legal opinion as to whether this new law applies to ratings granted before the law was enacted.

your Reference Committee approves the resolution and recommends that it be referred to our legal I so move counsel.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unani-计划之次 mously carried

Section 126 (See 15, 18)

n Sie Report of the Reference Committee on Report of Council-Part X Workmen's Compensation

Dr. F W Holcome, Ulster The report of the Workmen's Compensation Committee is so replete with details and information concerning the activities of the Committee during the past year that your Reference Committee can comment only on the more important matters and recommendations contained therein

Your Reference Committee endorses the recommendations of the Committee that the County Society Compensation Committees hold regular meetings to consider the problems arising under the Workmen's Compensation Law and to carry out adequately the functions devolving upon the societies

We commend the spirit of cooperation between the county societies and the State Committee and the Bureau of Workmen's Compensation The proper administration of the Workmen's Compensation Law and the protection of the interests of the medical profession can be furthered by close relationships between the county society and the State Committee, the Workmen's Compensation Board, insurance 4carriers, and employers

While your Reference Committee makes no comment on the cost of those services and how they should be met, they are reflected in the cost of running the Society and may eventually justify an ? increase in the State Society dues It is proper in this connection to draw attention to the statement in the report to the effect that under the old fee schedule physicians during the past few years have enjoyed an income annually of between twenty to thirty million dollars from workmen's compensation cases alone

Your Reference Committee approves the organization of the Joint Medical Conference Committee, comprising representatives of the Medical Society, insurance carriers, and employers It also endorses the recommendation of the Workmen's Compensation Committee that local joint committees be orgamzed throughout the State. In the smaller societies, groups of adjoining counties together may form a joint council to discuss workmen's compensation problems and to act in concert with the central joint medical conference committee The many items of interest reported or discussed by the conference often lead to decisions of mutual advantage and justify the above approval.

I move the adoption of this portion of the report There being no discussion, the motion was put

to a vote, and was unanimously carried DR. HOLCOMB According to the report for 1946 of the Chairman of the Workmen's Compensation Board the direct cost of workmen's compensation for this year was close to \$200,000,000 aside from the economic loss to workers and their families and to industry and Since medical service is the keystone in this great structure of social advancement, we commend the efforts of the Chairman and members of the Workmen's Compensation Board and their staffs This bespeaks a close and harmonious relationship between this State agency and the State Medical Society to the end that the administration of the Workmen's Compensation Law may be acilitated in the public interest

The free choice principle must be safeguarded by appropriate cooperation on the part of the medical profession in providing the highest quality of medical are at a reasonable and fair cost to the employers and their carriers Your Reference Committee can only repeat and emphasize many of the statements of the Workmen's Compensation Committee reating to this subject

Your Reference Committee wishes to emphasize the following portion of the Annual Report

"It is the duty of every physician to comply with the conditions imposed by the Workmen's Compensation Law to treat only such patients as he is qualified, by education training, and experience and to refer to a better qualified physician for treatment all patients requiring more expert or special care than he can render This is a moral and ethical duty and its strict observance will go a long way to justify and perpetuate the 'free choice' principle in the Compensation Law As it is the duty of the Workmen's Compensation Board to improve the administration of the law to the end that claims may be settled without delay so too, it is the duty of the physicians to cooperate with the authorities to bring about prompt and accurate reporting and appearing before referees when necessary

Prolonged treatment or improper medical care may keep the employee out of work beyond the time necessary to restore him to health and work Neither the importunities of the patient (who does not pay the bill) nor the expectation of greater fees should interfere with sending the patient back to his job as soon as medically indicated. Under the Workmen's Compensation Law a physician is unlimited in his calls upon the resources of the medical profession in order to get the patient back to work promptly The medical societies through their compensation committees and with the cooperation of the employers and the insurance carriers have a unique opportunity to be of service. We urge them to give great consideration

to these problems.

I move the adoption of this portion of the report.

The motion was seconded, and as there was no discussion it was put to a vote and was unani-

mously carried

DR. HOLCOMB Your Reference Committee commonds the Committee for its efforts to bring about a revision of the workmen a compensation fee schedule If the best qualified physicians in the State, and over 22 000 physicians have been authorized to treat compensation claimants are to be available for treatment the fees paid must be adequate. Low fees out of line with fees paid by private patients of a like standard of living combined with the necessary burden of making out and filing reports will have a tendency to discourage physicians from ac-

cepting compensation claimants
Your Reference Committee learns with some satisfaction of the partial revision of the Workmen s Compensation fee schodule announced on May 5 by Miss Donlon. Her action based upon the report of her Advisory Committee is appreciated as a step in the right direction. We urge that the Advisory Committee give prompt attention to the upward revision of the remaining items in the fee schedule proposed by the President of the State Medical Soclety in accordance with the provisions of Section 13 of the Workmen's Compensation Law I move the adoption of this portion of the report.

Dr. RALPH SHELDON Wayne I second the motion.

SPEAKER ANDRESEN Is there any discussion? DR. ABRAHAM KOPLOWITZ, Kings I would like to second this part of the report My motion is that the delegates of this House express their gratitude to Dr Van Etten and his Committee for their work and

our appreciation to Miss Mary Donlon for her understanding and fairness

Dr. Holcoms That is at the end of the report if you will bear with me until then.

Dr. Lortowrrz Oh it is?

Dr. HolcoxB 1cs

The question was called and the motion was put to a vote and was unanimously carried

Your Reference Committee Dr. Holcomb learns with concern of the refusal of the Chairman of the Workmen's Compensation Board to authorize physicians in the employ of the State as psychia trists and pathologists to treat compensation claimants although the Commissioner of Mental Hygiene favors such authorization and has no objec-tions thereto This deprives certain localities of the State of the services of certain specialists not other wise available in compensation and other cases urge the Chairman of the Workmen s Compensation Board to reconsider this matter in the light of this recommendation.

Dr. Harry Aranow (Councilor) If I understand it correctly the reason she refused it was because she

felt they were occupying another State Job Dr. Holcoup That is right. That was her reason I believe, for refusing it but as we have pointed out in certain localities in the State there are only a few men who are qualified to do this work, and their services are needed at times

I move the adoption of this portion of the report

The motion was seconded, and as there was no further discussion, it was put to a vote, and was unanimously carried.

DR. HOLCOMB County societies are admonished Dr. Hollouis County societies are admonstaged to read carefully the report of the Committee on Professional Qualifications and to carry out the recommendations carefully We quote from the report

'We believe the determination of professional qualifications should be the function of the medical societies and remain within the province of or ganized medicine. Standards should be suffici ently high so that a physician who is rated as a specialist under the Workmen's Compensation Law will be regarded with the same confidence and respect as the holders of National Board specialty diplomas and members of the American Colleges Our standards are such that if the county medical society workmen's compensation committees adhere closely to them, the recipionts of specialists symbols will be of such professional stature as to justify the confidence placed in the organized profession by the executive and law making bodies of the State.

The County Medical Society Compensation Com mittees have a definite advantage over the Medical Practice Committee which is composed of only three Practice Committee when a complexe to only three members. The Society Committees have set up specialist advisor; subcommittees to qualify specialists which obviously could not be done by a Medical Practice Committee. We, therefore urgs the abolition of the Medical Practice Committee and the restoration of functions to the Workmen's Compensations Committees in the countries of the Society of th sation Committees in the counties of one million and more population. Over a period of nearly eleven years there has been a gradual improvement in procedure so that the recommendations of county medical society workmen's compensation committees may be looked upon as authoritative

I move the adoption of this portion of the report The motion was seconded, and as there was no discussion, it was put to a vote, and was unani-

mously carried

DR HOLCOMB (M-17, Thoracic Surgery) In 1942 your committee, after approval by the Council, recommended to the Department of Labor that the symbol M-17, which previously had been a catch-all for unrelated specialties, be abolished, and that M-17 be utilized for the specialty of thoracic sur-Under date of March 30, 1942, Mr Ralph R Boyer, director of the Division of Workmen's Compensation of the Department of Labor approved the use of this symbol for thoracic surgery

The present Chairman of the Workmen's Compensation Board, Miss Mary Donlon, has recently raised the question as to the validity of this symbol. A determined effort is being made to induce the Chairman of the Workmen's Compensation Board to confirm the use of this symbol for thoracic surgery

We recommend that the symbol M-17 be granted to physicians who possess the necessary qualifica-

tions established for this specialty

I move the adoption of this portion of the report

The motion was seconded, and as there was no discussion, it was put to a vote, and was unani-

mously carried

Dr. Holcomb As a result of the Condon Bill. Senate Introductory 1708, the Workmen's Compensation Law has been amended giving to the Chairman of the Workmen's Compensation Board authority to review the qualifications of physicians upon the recommendation of the Medical Practice Committee or of the Workmen's Compensation Committees of the Medical Societies outside the metropolitan area The Chairman may on such advisory recommendation review and after reasonable investigation revise the rating given to a If the physician is dissatisfied with the physician change he may appeal to the Medical Appeals Unit of the Industrial Council It is the opinion of your Reference Committee that before a county society or the Medical Practice Committee makes a recommendation to change a physician's rating, he be given an opportunity to appear before the Committee and defend his position. The law, as amended, does not provide for such initial hearing original hearing is advisable because even though the physician has a right of appeal to the Medical Appeals Unit of the Industrial Council, the decision of such Medical Appeals Unit is only advisory to the Chairman of the Workmen's Compensation Board Thus, a physician may be in a position where his rating was changed after investigation of the Chairman of the Board and even though the Medical Appeals Unit agreed with the physician in his position, the Chairman of the Workmen's Compensation Board might ignore the findings of such Medical Appeals Unit and maintain her original position. We, therefore, recommend that a hearing be vouchsafed every physician before a recommendation is made that his rating be changed
I move the adoption of this portion of the re-

port

SPEAKER ANDRESEN Is there any discussion? Dr. Thomas M D'Angelo, Queens I would like to ask whether or not the county society has the same privilege If the rating is increased can the county society then come back and ask for a hearing of their side?

DR HOLCOMB That is the intent, that the physician be heard before his county society or before the Medical Practice Committee before his rating is changed Our feeling is that he is entitled to a hear-

The motion was seconded, and as there was no further discussion, the motion was put to a vote.

and was unanimously carried.

DR HOLCOMB In conclusion, your Reference Committee wishes to call to the attention of the Medical Society the tremendous amount of time and unselfish effort which the Council Committee, composed of Drs Dattelbaum, Mellen, and Henry, has contributed to this very vital work

We also particularly desire to commend Dr. David Kaliski, Director of the Bureau of Workmen's Compensation of the State Medical Society, for his wise and able direction and comprehensive knowl-

edge of his duties

I move the adoption of this portion of the report The motion was seconded, and as there was no discussion, was put to a vote, and was unanimously carried

DR HOLCOMB I move the adoption of the report

as a whole, as amended

The motion was seconded, and as there was no discussion, was put to a vote, and was unani-

mously carried

DR. MAURICE J DATTELBAUM Since we are aving out so much thanks for the work done by the State Society and the Committee of the Council, I believe we owe a vote of thanks also to Miss Donlon for her cooperation, her tactfulness in the handling of such a serious question so ably, and also a vote of thanks to Dr Van Etten and his committee for enabling us to get this increase You have no idea how much time they have put into this whole problem I move that

DR ABRAHAM KOPLOWITZ I second that SPEAKER ANDRESEN I don't believe we need to refer that to a reference committee

CHORUS No, let us act on it now

The question was called, and the motion was put to a vote, and was unanimously carried

Section 127 (See 49) .

Report of Reference Committee on New Business B Conditions Governing the Relationships Between the Hospitals and the Specialists of Laboratory Medicine in the State

W WILLIAMS, Bronx There have been two resolutions referred to the Reference Committee

on New Business B

On the resolution introduced by Dr Stephen Curtis, of Rensselaer County, on "Conditions Governing the Relationships Between the Hospitals and the Specialists of Laboratory Medicine in the " reading

State," reading
"WHEREAS, it has been established by the American Medical Association that the practice of pathology is the practice of medicine, and

"WHEREAS, many of the recent advances in the field of medicine are directly attributable to the contribution of the workers in the field of laboratory research and the practical applications thereof in the field of clinical medicine, and

"WHEREAS, the practitioner of medicine welcomes and utilizes fully the scientific help supplied by these practitioners of laboratory medicine, and

"WHEREAS, in the hospitals of this country there now exists an intolerable situation by which the natural expansion of laboratory medicine is

being retarded
(a) Through the improper and arbitrary con trol of the scientific and administrative efforts of this group of medical practitioners and

(b) By the extensive economic exploitation by the institutions of the scientific efforts of

this group, and "WHEREAS it is the feeling that the present existing situation will diminish the number of younger men entering the ranks of this specialty thus seriously deploting a growing and increasingly

useful branch of medical practice, now be it

Resolved that the House of Delegates of the
Medical Society of the State of New York give cognizance to the existing situation and be it

further

Resolved, that the situation be carefully studied by the Society with the avowed purpose of developing a new pattern of practice of the specialty of laboratory medicine in the hospitals placing such practice on the same broad basis as now governs the relationship of medical specialists with the institutions of this State, and that a committee be appointed by the President with the approval of the Council to carry out this study,

which resolution was introduced at the request of the New York State Society of Pathologists your Refer ence Committee has considered this resolution, and after deliberation recommends that, in full realiza-tion of the fact that the problem of the laboratory men and their relation to the hospital has been presented to this House in many varied aspects in several resolutions over the years this resolution be approved in principle and that it be referred to the Council for action.

I move the acceptance of this recommendation.

The motion was seconded and as there was no discussion, it was put to a vote and was unanimously carried.

Section 128 (See 88)

Report of Reference Committee on New Business B Medical Economics in Medical Schools

DR. FREDERICK W WILLIAMS, Bronz. Regarding the resolution introduced by Dr. William B. Rawls, of New York County on the subject of Medical Economies in Medical Schools

WHEREAS, the training of medical students is to a great extent under the direction of full-time teachers who are not and in many instances were nover, engaged in the practice of medicine and, therefore are frequently not acquainted with or not in sympathy with the viewpoint of the practitioner of medicine on socio-economic problems

WHEREAS, at a previous meeting of the House of Delegates of the American Medical Association it was requested by the House that courses in economics be established in medical schools as soon as feasible and

WHEREAS such a program was delayed by the

onset of war therefore, be it

Resolved, that the American Medical Associa tion, through proper channels, take active steps to insure the presentation to all medical atudents in the United States of the viewpoint of the practitioner of medicine on socio-economic problems and be it further

Resolved that the American Medical Associa

tion assist in the preparation of the material, the securing of speakers or in any way that is deemed necessary to further the institution of such a program at the earliest possible date

after consideration of this resolution your Reference Committee recommends its adoption I so move

Dr. Alfred M. Hellman, New York I second the motion.

SPEAKER ANDRESEN Is there any discussion?
DR. HARRY ARANOW (Councilor) We cannot resolve what the American Medical Association can We can resolve to recommend to the American Medical Association but we cannot resolve what they shall do

Speaker Andresen Will you change the wording

of that to meet that objection?

DR. WILLIAMS Yes we would be glad to accept the amendment in the resolved clauses to read

"Resolved that we recommend that the American Medical Association, through proper chan nels etc. and

Resolved, that we recommend that the Ameri can Medical Association assist in the preparation of the material, etc.

The question was called, and the motion was put to a vote and was unanimously carried.

Section 129 (Sec 23)

Report of Reference Committee on Report of Council-Part IX Basic Science Law

Dr. Andrew A Edoston, Westchester This is a resolution that was introduced by Dr. Charles Gullo of Livingston County in regard to the Basic Science Law

WHEREAS, the intent of the resolution of Dr. George Cottis made before this House of Delegates in October 1945 was that an abstract be printed of the essential points of the Basic Science Law, showing where it has worked and where it has not worked, why it has not worked, and whether the American Medical Association is wrong when it goes to the trouble of preparing a model act for us to follow, and "WHEREAS, the Medical Practice Committee in

its present report does not contain certain factual material necessary for its members to arrive at a proper decision as to the desirability for an ideal Basic Science Law for New York State as a safeguard to prevent the licensing of cults and at the same time serve to implement the Medical Practice Act in order to prevent the circumvention of the Medical Practice Act therefore be it

Resolved that there be a full discussion on the floor in executive session with the House of Delegates serving as a Committee of the Whole and that each county be given the opportunity to ex press some opinion upon this question,

After many years of consideration of the Basic Science Law by previous Houses of Delegates legislative and reference committees, supplemented by the exhaustive study of your Medical Practice Committee and in addition the action of the present House of Delegates in disapproving the Basic Science Law your Reference Committee recommends disapproval of this resolution.

I so move

The motion was seconded and as there was no discussion it was put to a vote and was car ried

> ٠٠٠ t

Section 130 (See 28, 95)

Report of Reference Committee on Report of Council-Part XI Establishment of Organization Section in the New York State Journal of Medicine

Dr. Eugene H Coon, Nassau I wish to report on the Bronx County resolution that was referred back to the Reference Committee of Report of the Council Part XI regarding certain changes of the JOURNAL

"WHEREAS, sound functioning of a democratic organization is dependent upon an informed

electorate, and

"WHEREAS, our New York State Medical Society, especially the House of Delegates, is such a democratic organization, and

"WHEREAS, the Council acts for the State Society between sessions of the House of Delegates,

and

"WHEREAS, it is the custom to publish the reports of the Officers, Council, and Standing Committees in the April 1 and April 15 editions of the NEW YORK STATE JOURNAL OF MEDICINE JUST preceding the annual meeting of the House of Delegates, and

"Whereas, this custom allows insufficient time for study and deliberation by the representative county societies to enable them to instruct their

delegates, therefore, be it

"Resolved, that the House of Delegates of the Medical Society of the State of New York direct the Publications Committee to establish an Organization Section in the New York State JOURNAL OF MEDICINE similar to that of the Journal of the American Medical Association, and be it further

"Resolved, that there shall be published in this section all minutes of Council meetings, progress reports of all standing and special committees, and any additional information which the Council may direct"

Your Reference Committee agrees in principle with these parts of the resolution However, the Committee feels that there may well be certain items incorporated in the minutes of Council meetings which should not be published and, therefore, become public information, hence we recommend that only such portions of minutes of the Council meetings as the Council may direct be published in the JOURNAL, together with progress reports of both standing and special committees and any additional information which the Council may direct

I move the adoption of this portion of the report The motion was seconded, and as there was

no discussion, it was put to a vote, and was unanimously carried

DR COON Continuing with the same resolution

"Further Resolved, that the annual reports be published in the March 15 and April I issues of the NEW YORK STATE JOURNAL OF MEDICINE '

Your Reference Committee is in sympathy with the spirit of this part of the resolution These reports should be published to reach the membership After consultation with our Secretary, Dr Anderton, and the Editorial Board of the JOURNAL, we find that the failure of the Council Committee Chairmen to file reports before the March 1 deadline causes the delay in publication. We recommend that the President urge all Council chairmen to be more prompt in filing their reports

I move the adoption of this portion of the report The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

Dr Coon I now move for the adoption of the

report as a whole

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

Section 131

Report of Reference Committee on Report of Council-Part III School and Industrial Health

DR JOHN T DONOVAN, Erie The Study Committee on Industrial Health held a meeting in New York City on November 13, 1946, to discuss the educational program Present at this conference were members of the Council Committee on Public Health and Education, and some of the officers of the Medical Society of the State of New York

Many of the lectures arranged by the Committee on Public Health and Education for County Medical Societies are a part of the Industrial Health Program

even though not so designated

In view of the fact that industrial health and school health are becoming a much larger field in medicine each day, that there are many physicians taking up industrial health, and that it is recognized as a branch of medicine which is doing worthwhile work in the medical field, your Committee believes that more attention should be paid to these fields of industrial health and school health, and that men in those fields be encouraged to bring their problems in closer relation with the Medical Society of the State of New York.

The Committee also believes that there should be a division of the various subjects relating to industrial health and school health, brought out independently of the Public Health and Education Com-

mittee

I move the adoption of the report

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

Section 132 (See 81)

Report of Reference Committee on Report of Council—Part VIII Veterans Medical Service Plan of New York, Inc.

DR LEO E GIBSON, Onondaga This is the report of the Reference Commuttee on Report of the Council, Part VIII, on the resolution introduced by Dr Herbert H Bauckus, Past-President, concerning Veterans Medical Service Plan of New York, Inc.

"WHEREAS, the veteran suffering from injury or disease incurred during service in the armed forces deserves not only great sympathy from the com-

munity but medical care second to none, and "Whereas, the State of New York through its workmen's compensation commission provides the highest type of care for its injured workers,

and
"Whereas, veterans with service-connected disabilities should receive medical care of the same high quality as is now being rendered under Veterans Medical Service Plan of New York, Inc. and

"WHEREAS, the majority of patients in veterans hospitals are those with nonservice-connected disabilities and the Veterans Administration contemplates the erection of enormously increased facilities, primarily to take care of veterans' nonservice-connected disabilities, and

"Whereas, it would be false economy to deprive the voterans with service-connected disa bilities of the finest medical care therefore be it

Resolved, that the Medical Society of the State of New York importune the President of the United States and the Administration of Voterans Affairs to continue and augment the present "home town medical care program and be it further

"Resolved, that the delegates from the Medical Society of the State of New York are hereby in structed to present a resolution to the House of Delegates of the American Medical Association urging the same consideration for the veterans of the entire United States

This resolution is approved as presented and I move its adoption

The motion was seconded and as there was no discussion, it was put to a vote, and was unani mounly carried.

Section 133 (See 82)

Report of Reference Committee on Report of Council—Part VIII Veterans Care in Civilian Hospitals

Dr. Leo E. Gibson, Onondaga. On the resolution introduced by Dr Benjamin M Bernstein of Kings subject 'Veterans Care in Civilian Hospitals

"Whereas, the present practice permits any physician practicing in the State of New York to care for a veteran for a service-connected condition

at home or office and
WHEREAS, the present practice except in
isolated instances, does not permit the physician caring for this voteran to extend such care to a civilian hospital thus interfering with the continuity of care given to the veteran by his physi-

cian, be it
Resolved that the Veterans Administration be as to permit the continuous care of the veteran by the physician of his choice, either at the veteran's home, at the doctors office, or in any civillan hospital in which the physician usually cares for his own private patients

This resolution is approved by your Reference Committee

I move its adoption.

The motion was seconded, and as there was no discussion it was put to a vote and was unant

mously carried SPEAKER ANDRESEN Are there any other com-

mittee reports? There was no response.

SPEAKER ANDRESEN Are there any other committee reports or any more motions?

There was no response

SPEAKER ANDRESEN Are there any more resolu tions?

There was no response.

SPEAKER ANDRESEN This is your last opportunity to introduce any resolutions. No resolutions can be introduced tomorrow

There was no response.

Speaker Andresen If not I have a couple of notices

Section 134

Notice by Dr James F Rooney of Intention to Introduce General Amendments to Bylaws

SPEAKER ANDRESEN Dr Rooney gives notice that he proposes to introduce general amendments to the bylaws at the next meeting of the Society gives him an opportunity to get them published a month before the next meeting to make it legal

Section 135 Appouncements

SPEAKER ANDRESEN I want to speak about the exhibits As you know the technical exhibitors con tribute a great deal to the cost of this meeting. It is desired to have as many people go down and look at the chilbits as possible so whenever you have the chance to go down and look them over please do so The other thing is that Mr Anderson is very

anxious to have you buy your tickets for the ban quet for tomorrow night if you are going to be here because he has to let the hotel know tonight

how many to arrange for

If there is no other business we will recess until 9 o clock tomorrow morning, when the first business will be the Election of Officers

The session recessed at 6 05 P M.

### Morning Session Wednesday, May 7 1947

The session convened at 9 50 A.M.

SPEAKER ANDRESEN The House will be in order I have a couple of announcements to make first is that the newly elected Council which we are going to elect today will meet immediately after this session, and the Board of Trustees will meet immediately after that,

Also I would like to announce again about the banquet for tonight at which they are going to honor the men who have been fifty years in the Society The dinner is to be informal but you may wear evening dress if you like. We would like to have you buy your tickets some time early this morning.

#### Section 136

Appointment of Planning Committee for Medical Policies

SPEAKER ANDRESEN Also I would like to an nounce that the Speaker wishes to reappoint the Planning Committee that served us so well last year That includes the five officers and Dr Kenney

We will listen later this morning to the announce-ment of the Awards Committee They are not quite ready to report on the awards for the exhibits

### Section 137

#### Flections

SPEAKER ANDRESEN The first order of business this morning is the election of officers. We want to inquire first whether we have a quorum

Mr Secretary how many are present? SECRETARY ANDERTON The number has not been counted but there are more than the required number for a quorum.

SPEAKER ANDRESEN A quorum is present.

We now come to the nominations. Before we go into these however I want to announce that we have a long list of tellers

DR CARLTON E WERTZ (Councilor) Fellow Members of the House, tonight at seven o'clock is the Annual Meeting and Dinner of the Society of the State of New York. Tonight, particularly, the State Society is honoring the men who have been in practice fifty years or more. There are eighty such men who have accepted the invitation

of the Society to be at this meeting. We would like to have as many as possible of the delegates and alternate members of the Society at that dinner The meeting is considered of so much importance that Lase magazine is sending two of its photographers there We hope all of you will try to be present tonight Tickets are available in the rear of the room as you leave

Section 138

Report of Committee on Awards for Scientific Exhibits

One very hardworking Speaker Andresen committee at these annual meetings is the committee that makes the awards for the scientific exhibits These three members have been working very hard for the last couple of days in order to pick out the ones that they consider best I will call on Dr Albert A Gartner, the Chairman of that committee, to report

DR. Albert A Gartner This committee was handicapped by the fact that on Monday the scientific exhibits were not set up. There are so many scientific exhibits, and they are all so good that it is very difficult to judge these exhibits

#### SCIENTIFIC AWARDS

First Prize Dr Siegfried Tannhauser, Buf-The Diagnosis of Malignancy from Histologic Sections of Pleural and Abdominal Fluids, Sputum, and Urine

Second Prize

Drs Kurt Lange, Linn J Boyd, David Weiner, New York Medi-cal College, Flower and Fifth Avenue Hospital, New York City—The Use of Fluorescent to Determine the Adequacy of the Circulation

Honorable Mention Division of Laboratories, New York State Department of Health—Cerebrospinal Application of Newer Knowledge to Medical Practice

#### CLINICAL AWARDS

First Prize Dr Charles LeRoy Steinberg, Rochester—Primary Fibrositis Dr Abner I Weisman, New York-The Gynograph—A New Instrument in the Diagnosis and Second Prize

Treatment of Female Sterility

New York Hospital, Westchester, Division, White Plans-Equipment Aids for Occupational Therapy Honorable Mention

The members of the Committee are Burrill B Crohn, of Manhattan, Dr W W Street, of Syracuse and myself as Chairman.

Section 139

Basic Science Law, Methods to Control Cults

DR JAMES F ROONEY (Trustee) I desire to ask the unanimous consent of the House to present a motion that should have been presented yesterday, but because the idea of making this motion only germinated during last night, and it is rather an important thing in view of the interest the House showed in the presentation of the report of the Reference Committee yesterday on the subject, I will state the nature of the motion. It will be a motion to enable the President to appoint a com mittee as a subcommittee of the Council to study the methods to be applied for the control of cults, this committee to report with its recommendations to this House at the next Annual Meeting That will be the motion and I ask the unanimous consent of the floor to present it

The motion was seconded, and as there was no discussion it was put to a vote and was unani-

mously carried

Dr. Rooner Mr Speaker, I think the stenogra pher has the motion and unless the House wishes me to repeat it I will not take the time to do so I will ask the Speaker to put the motion for whatever · discussion there may be

DR. EDWARD A. GRIFFIN Kings I second the

motion.

SPEAKER ANDRESEN The motion is to have the President appoint a Subcommittee of the Council to study the question of the control of cults and to report at this House a year from now
DR. FREDERICK S WETHERELL, Onondaga

that a Committee to be appointed by the President

from members of this House? DR ROONET YOL

SPEAKER ANDRESEN That committee is to be appointed by the President from members of this House Is there any discussion?

The question was called and the motion was put to a vote, and was unanimously carried

Section 140

Vote of Thanks to Dr. Duncan W. Clark, Chairman of the Scientific Program

DR. A. W MARTIN MARINO Kings The chalr manship of the Scientific Program is a tremendous job A perusal of the program will give you a little idea of the amount of work involved The Chair man for 1917 has spent many hours and days ar ranging this year's splendidly diversified and interesting program. Therefore I move that Dr Duncan W Clark, Chairman of the Scientific Program be given a vote of commendation.

The motion was seconded, and as there was no discussion it was put to a vote and was unant

mously carried.

Section 141

Vote of Thanks to Local Committee on Arrangements

Dr. Flotd S. Winslow (Councilor) Mr Speaker I move that this House of Delegates give a vote of thanks to the delegation from Buffalo and their committee for the arrangements they have made to entertain us as their guests throughout this meeting.

Secretary Anderton I second that.

SPEAKER ANDRESEN The motion is to extend a vote of commendation to the local committee on arrangements for their work. Dr Bauckus wishes to discuss that,

DR. HERBERT H BAUCEUS (Past President) Mr Speaker and Members of the House, were it not for the fact that you are waiting for the report of Tellers I would not take your time with this dis-cussion, but I would like to say that many of us feel very depressed indeed over the kind of weather we have provided for you You may be surprised at this but we do have good days, and if you will come here on the third of July it will be a nice warm day Don't come on the fourth because it always rains then.

I want to apologize for the fact that we have had to meet here in this gloomy dirty dungeon. It is

too bad that we got into this trouble but here we are and of course you have all had to make the bost of it If I have seemed to be cold and preoccupied the last few days it is because of that, and also because I am trying to think of what to say to the city authorities about this I apologize to all of you, and I think we should especially mention the fine receptions that we have had in New York City where so many of the meetings have been held. We tried to make you feel at home here and we arranged for Oklahoma to play across the street. That is about the only thing I think we can claim. We might claim one superiority and that is we don't have any smallpox in Buffalo at least I don't think we do Nevertheless we hope that you will forgive these things that we really could not help and that you will forget about them and be happy to come with us again because we do enjoy seeing all of you and helping to do something for the Medical Society of the State of New York.

The question was called and the motion was put to a vote, and was unanimously carried.

SPEAKER ANDRESEY One thing that Dr Bauckus failed to mention is that they do have an epidemic here of ringworm of the scalp Of course, that is not

as bad as smallpox. (Laughter)

Section 142

Vote of Thanks to Dr J G Fred Hiss, Chairman of Committee on Scientific Exhibits

DR. HOMER J INNICKERBOCKER, Ontario I think we should also give recognition to the work of Dr Fred Hiss, who is Chairman of the Committee on Scientific Exhibits.

DR. JAMES Γ ROONEY (Trustee) I second the motion

There being no discussion it was put to a vote and was unanimously carried.

Section 143

Vote of Thanks to the Speaker

Dil J Stanley Kenney (Councilor) Gentlemen of the House while this bunch of bouquets is being passed out this House would be most remiss if it did not express itself on the record as appreciating the very fine work of our new Speaker He assumed his duties here under very difficult and trying circumstances, and he has done a wonderful job like to have this House express its commendation of his maiden effort

Dr. James F Rooney (Trustes) I arise to second I am also going to reprimand Dr that motion Kenney for trying to steal my thunder but I became engaged in conversation That is my usual motion. I have sat in this House in the time when we had no Speaker when the President of the Society tried to run the House of Delegates, and most of them had one most God-awful time That is how we came to institute the office of Speaker I have seen every Speaker I have sat under them sometimes I have speaker I have sat under them sometimes I have been knocked down by them, but I do want to say this, gentlemen, with all my heart I think that our Speaker today was in a frightfully embarrassing position. We have never had, except for our first Speaker any man elected as Speaker who had not served as Vice-Speaker for at least three years until be got the feel of it. I frankly felt when I made my first statement to the House on Monday, friethfully first statement to the House on Monday frightfully sorry for Dr Andresen. He may not have thought so, but I did. He, furthermore followed by a very brief interim one of the best speakers, and, probably

the best speaker this House ever had, and that is our present President, Dr Bauer It was a hard thing to fill his shoes, but I think every one of us will say That the astounding savoir faire with which from the very first hour on Monday morning this Speaker has developed has been like a new rose in full-time during the first two days of this session, I think it has been a magnificent accomplishment (Applause)

I heard throughout the House two, three, or four times within the last two days, "What did you try to do to Dr Andresen?"

I said, "Make him happy"

Well perhaps I did not be to be

Well, perhaps, I did not succeed, and if I did not I want to apologize now, but I think my good friend knows that what I wanted to do on Monday morning was to wake this House up and get a laugh We got it I hope he will live long, and will flourish, and remain our Speaker until he goes to higher (Applause)

SECRETARY ANDERTON Is there any further discussion of this motion? If not, the Chair will be glad to entertain a rising vote in appreciation for the Speaker's masterful presiding at this meeting

The motion was carried by the delegates

arising and applauding

SPEAKER ANDRESEN I thank you very much, gentlemen, for your well wishes I felt very hesitant when I came here Monday morning I did not know how I was going to make out With your help and your patience with me, we have gotten on, and it has been very much appreciated. I have enjoyed every minute of the meeting I enjoyed Dr Rooney's help, and I certainly appreciate this rising

Are there any other motions? There was no response

#### Section 144

#### Remarks by President-Elect

Speaker Andresen We would like to hear, I think, a few words from our President-Elect

Dr Rooney, will you conduct our President-Elect, Dr Simpson, to the platform

Dr Simpson was conducted to the platform

by Dr James F Rooney amid applause

Dr. Leo F Simpson Ladies and Gentlemen, I am indeed grateful to this House for thinking me worthy of this high honor My capacity to fill this office when my time comes, in a manner worthy of the standards that have been established by the many great men who have headed it, is in the lap of the gods I will, however, before that time comes, have had the benefit of the tutelage of one of the greatest of them all, Dr Louis H Bauer

I know that this is not a one-man job A man in office is constantly surrounded by the ablest coun-That is his hope, and therein lies his strength

I welcome the opportunity to repay in some small measure the debt that I, personally, owe to medicine

Thank you! (Applause)

#### Section 145

#### Remarks by Vice-President

SPEAKER ANDRESEN While we are waiting we would like to hear from our Vice-President, Dr Todd

DR RALPH T B TODD Mr Speaker and Gentlemen of the House of Delegates, I have one face that I am looking at now He told me this might happen to me, and he asked me what I was going to say I said that when I got on my feet my speech disappeared as well as my lap But, seriously, I don't know why I have received this honor I have given some work to the Medical Society both in the County and the State, but I was forced to leave • the ranks of the Council two years ago I was sorry for that because I could see what the Council members were doing for the profession of this State You men who come here each year get their reports, but you can hardly realize just what each member on that Council does for the medical profession of this State and this Country

If I have any remarks at all, it would be to go back home and interest every individual in your various communities to take hold because they do owe, I feel, at least as much as I have given to my profession Let us do that and get the young men interested in the Medical Society so they may give a little of themselves to our profession, which is per-

haps the greatest profession in the world

Thank you! (Applause)

#### Section 146

#### Remarks by Vice-Speaker

SPEAKER ANDRESEN Thank you, Dr Toddl I would like to introduce my new Vice-Speaker, Dr Strohm Next year we will have to give him some work to do

VICE-SPEAKER NELSON W STROHM Mr Speaker and Members of the House of Delegates, during the last few minutes I have been trying to find out just what qualifications I had to have this very distinct honor thrust upon me The only one I can find out is that I live Upstate (Laughter) I hope maybe in the years to come we may find one or two more I do appreciate this honor, and I want to thank you all (Applause)

#### Section 147

#### Vote of Thanks to Board of Tellers

ABRAHAM KOPLOWITZ, Kings I want to move that we express a vote of thanks to Dr McCarty and his Committee of Tellers

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

SPEAKER ANDRESEN Is there any further business to come before this House of Delegates

There was no response

SPEAKER ANDRESEN If not, the meeting stands adjourned sine die

(The meeting adjourned at 11 30  $_{\rm A}$   $_{\rm M}$ )

#### NECROLOGY

Hugh Auchincless, M.D., 68 of New York City, died on September 21 A graduate of Yale University in 1901 and the College of Physicians and Surgeons Columbia University in 1905, Dr Auchin closs was consulting surgeon at Vassar Brothers Hospital, Poughkeepsie and New Rochelle Hospital He became attending surgeon at the Vanderbilt Clinic in 1932 and also professor of clinical surgery at Presbytorian Hospital Medical Center becoming During the influenza professor emeritus in 1946 epidemic in 1917 he devised the Auchincless tube used for drainage of the pleural cavity Dr Auchin closs was well known for his surgical work in con nection with cancer of the breast and infection of the hands He was a fellow of the American College of Surgeons and a member of the American Thoracic Surgical Society the State and County medical societies, and the Academy of Medicine Theodorus Bailey, M.D., of New York City died

#### Medical School Receives Bequest

THE University of Buffalo's Medical School is a chief beneficiary under the will of Mrs S Margaret Berrick Meyer, who died at Lake View on July 28 She was the widow of Dr Edward J Meyer, once president of the Board of Managers of what was then the Buffalo City Hospital and is now the Edward J Meyer Memorial Hospital

The bequest to the University of Buffalo is to be used, according to the will, to construct, maintain and equip a medical school laboratory "for scientific

teaching, and research" The laboratory is to be known as the Edward J Meyer Laboratory "or a similar designation"

If the legacy is sufficient, there will be an endowment fund to defray the expenses of operating and maintaining the laboratory, another endowment, the income of which will be used to pay the salaries of one or more teachers of the school of medicine "whose teaching and research is identified with the laboratory"

#### PERSONALITIES

Announcement has been made that the Westhampton Medical Group opened its center in Westhampton in August The members of the group include Dr Leroy B Davis, Dr Seth Ransom Jagger,

and Dr Paul Van Wart Waldo

#### HOSPITAL NEWS

#### Project Underway on Old Age Diseases

NEW York University's College of Medicine and the Goldwater Memorial Hospital, Welfaro Island, New York City are conducting a project in research of old-ago diseases it has been announced by Dr J Murray Steele, associate professor at the College of Medicine and director of the University's Third Medical Division at Goldwater Memorial Hospital.

The program will be carried out at the hospital under the supervision of Dr Steele and a staff of research specialists from the College of Medicine. It will be sponsored by several cooperating agencies, including the City of New York, the National Insti tute of Health of the United States Public Health

Service and the Macy Foundation.

"Herotofore Dr Steele said, "patients with old-age diseases have been available for study only over the short periods of time that they were confined to hospitals. This meant that partial histories and ease records of many individuals are the only ones available for study The averaging out of these figures have provided the only way of arriving at some kind of conclusion about the findings of the diseases studied

However the research project will run along differ ent lines. Patients will be available for research over long periods of time as long as ten to fifteen years. In this way research specialists will be enabled to make a continuous study of old ago diseases as they affect the individual patient giving them the op-portunity to record changes in the diseases and to determine and coordinate cause and effect as reliably as possible

The program marks the first time the facilities of a complete hospital will be available for the study and causes of old age diseases although other insti tutions have carried on similar projects on a partial

basis

Dr Steele said the City of New York has aided the groundwork for the program by making available the use of laboratories and a "main staff" of meetinchers.

#### Hospital Study Now in Progress

A COMPREHENSIVE state-wide program for adequate hospital facilities is now in force with the making of an inventory of existing hospitals by the Hospital Survey and Planning Commission

The Commission headed by Robert T Landsdale State Commissioner of Social Welfare will carry out in New York State the program of the Tederal Hos-pital Survey and Construction Act It is empowered to develop a plan for construction of such public and other nonprofit hospitals as it deems necessary Other members of the commission are Dr Herman E Hilloboe State Commissioner of Health, and Dr. Frederick MacCurdy State Commissioner of Mental

A State Advisory Council to the commission, headed by Lee B Mailler superintendent of the Cornwall Hospital and State Assembly leader has

been appointed by Governor Dewey

#### Cerebral Palsy Hospital to Be Opened in Rochester

THE University of Rochester has signed a contract with the State Health Department for operation of the State s first cerebral palsy research and treat-ment center to be opened this fall in LeRoy

The research and rehabilitation hospital will be operated by the University's School of Medicine and Dentistry and the Strong Memorial Hospital in co-operation with the State Health Department and the National Foundation for Infantile Paralysis.

The State Legislature at its last session appropri-

ated \$150 000 for the LeRoy center and the National Foundation in July 1946 gave the school a program. Mr and Mrs. Ernest L. Woodward, who gave their estate to the Hospital, have provided funds for remodeling the three-story brick house.

The Foundation-sponsored program is under the direction of Dr R. Plato Schwarts associate professor of orthopedic surgery at the University of Rochester School of Medicine.

#### News Notes

Four thousand persons with speech or voice defects were treated last year by the National Hospital for Speech Disorders Dr. James Sonnett Greene the medical director reported recently

Dr Greene, who founded the Hospital thirty years ago said 01 per cent of the patients receive free help. It is estimated that there are over 10 000 000 speech cripples in this country ported. The National Hospital for Speech Dis-orders at 61 Irving Place, New York City is the only medical institution in this country devoted ex clusively to treating them.

The merger of Beth Moses Hospital in the Williamsburg section of Brooklyn and Israel Zion Hospital in the Borough Park section of Brooklyn, was announced July 30 by Norman S. Goets, president of the Federation of Jewish Philanthropies of New The two hospitals will form a single institu tion to be known as the Maimonides Hospital. They will continue to occupy their present quarters

X ray equipment is being provided this fall by the State Health Department to aid in its tuberculosis diagnosing program in up-state hospitals. Accord

ing to Commissioner Herman E Hilleboe, the goal of the lending program is the examination of chests of all general hospital patients, with a view of find-ing unsuspected cases of tuberculosis Because of the limited number of state-owned v-ray units, Dr Hilleboe said that loans of equipment are limited at present to hospitals having 7,000 or more admissions a year

Work was begun in September on the new St Jerome's Hospital in Batavia, which is scheduled for completion late in 1948 Incorporating the latest advances in hospital architecture and equipment, the new fire-proof structure will have a bed capacity of 150, sixty more than is provided by the present building

The success of the Bone Bank of the Hospital for Special Surgery, New York City, was reported by Dr Philip D Wilson, surgeon-in-chief of the hospital, at a meeting of the American College of Surgeons in September Started in 1946, the Bone Bank has been useful especially in grafting for bone defects, such as home switters that Special court contains the started of the surple of the sur fects such as bone cyst, osteitis fibrosa cystica, fibrous dysplasia, and spine fusions.

Appointed.—Dr Frances Greenland, clinical assistant in surgery at Staten Island Hospital and adjunct attending doctor to Memorial Hospital's Strang Cancer Prevention Clinic in New York City, as director of the recently-opened cancer detection center, Staten Island Hospital Dr Warren M Pettingell as chief medical officer of the Veterans Administration hospital at Saratoga Springs, replacing Dr Adrian Gould Dr Stanton K. Livingston as staff doctor in charge of the V\_A hospital As chief of medical services of the Wyoming County Community Hospital, Dr Paul A Burgeson, associated with the hospital for over ten years Dr N M Levine, former director of St Lawrence County Laboratories in Ogdensburg, as resident county Laboratories in Ogdensburg, as resident pathologist in Utica State Hospital, replacing Dr Clarence Russell, who retired July 1 Dr A Benson Cannon succeeding Dr J Gardner Hopkins as professor of dermatology at College of Physicians and Surgeons, Columbia University, after serving as acting director of dermatology service at Presbyterary Respital from 1942 to 1948 ian Hospital from 1942 to 1946

Auxiliary to the AMA and Mrs. Harry F Pohl
mann State Auxiliary president.

## DEPARTMENT OF WORKMEN'S COMPENSATION

CONDUCTED BY DAVID I KALISKI M.D. Director

The New Fee Schedule

THE following interpretation received from the Tassistant counsel of the Workmen's Compensation Board on the new fee schedule which became effective June 1 1947 will be of interest

With regard to the increased medical fee schedule that became effective June 1 1047 the Advisory Committee, in recommending the increased schedule to the Chairman representative as you know of all parties in interest, had in mind that the increased fee should be applicable to those cases in which medical care began on or

after June 1 1947 Where a claimant did not recoivo any medical care before June 1 1947 the increased fee schedule is applicable regardless of date of accident.

In a case where treatment began prior to June 1 1947 and new doctor is called In after June 1 1947 the old fee schedule nevertheless is applicable Compared with the number of in creased fees there cases would be relatively few

DAVID J KALISKI M D

#### CORRESPONDENCE

#### On Theories of Renal Lithiasis

To the Editor

Dr R U Whipple, in his paper, "An Attempt to Unify the Current Theories of Renal Lithiasis," which appeared in the June 15 issue of the Journal, states that the underlying lesion theory is supported by Bermooten's explanation of the rarity of renal calculi in the South African negro by virtue of his simple diet, rich in vitamin A and low in calcium.

I am wondering how he could reconcile the findings of Greta Hammersten who produced kidney stones in animals by a diet low in calcium and magnesium and got rid of the stones by feeding a diet high in both of these elements

The danger in classifications, some sage has said, is that we get to thinking things actually fit into them. Somehow the formation of renal stones does not as yet seem to be amenable to a simple explanation

July 8, 1947 (Signed) ALICE R. BERNHEIM, M D New York Hospital

#### Comment by Dr Whipple

To the Editor

It is pleasing to note my article, "An Attempt to Unify the Current Theories of Renal Lithiasis," has stimulated some thought on the subject. That was my main purpose in writing the paper. I believe, by definition, a theory, which is what I have offered in the article, is a more or less plausible and acceptable principle offered to explain a phenomenon. Only when the proof becomes overwhelming by repeated support of many individual investigators does it approach the realm of a scientific fact.

In preparing this paper I reviewed a considerable amount of the pertinent literature. Unfortunately, I do not recall the paper of Greta Hammersten

quoted by Dr Bernheim To take the opposite side for just a moment, I might say we already know that undue mobilization of calcium, to wit, hyperparathyroidism, can and does cause renal stones in the human

Personally, I should like to see proof by other investigators working independently before using an isolated case as proof incontestable that a particular theory is not supportable

July 20, 1947 (Signed) RALPH U WHIPPLE, M D

21 Roybury Road Rockville Centre, New York

#### **ANNOUNCEMENT**

THE UNIVERSITY OF THE STATE OF NEW YORK THE STATE EDUCATION DEPARTMENT BOARD OF MEDICAL EXAMINERS

Dr W P Anderton, Secretary Medical Society of the State of New York 292 Madison Avenue New York 17, N Y

Dear Doctor Anderton

This is to notify you that the Board of Regents at meeting held June 20, 1947

Voted, That the determination of the Medical Committee on Grievances in the matter of the application for the revocation of the medical license heretofore granted to Jerome H Leadley, Rochester, be accepted and sustained, that, in compliance with the recommendation of said committee, said Jerome H Leadley be censured and reprimanded, that said Jerome H Leadley be ordered to appear for such censure and reprimand before the Board of Regents at a time and place to be determined by the Commissioner of Education, notice of which shall be given to said Jerome H Leadley by said Commissioner, and that the Commissioner of Education be empowered and directed to execute, for and on behalf of the Board of Regents, all orders necessary to carry out the terms of this vote

Dr Leadley is registered for the year 1947 from

447 Genesee Street, Rochester, NY The above order was served on Dr Leadley on June 30, 1947
Sincerely yours.

(Signed) JACOB L LOCHNER, JR, MD, Secretary NY State Board of Medical Examiners July 10, 1947

Dr W P Anderton, Secretary Medical Society of the State of New York 292 Madison Avenue New York 17, N Y Dear Dr Anderton

On November 13, 1940, we notified you that the Board of Regents at their meeting held October 18, 1940, voted that the New York Medical License Number 19804 issued to Aram Kazaz Andounian be annulled and canceled of record

Dr Andounian has applied to the Board of Regents for restoration of his medical license and the Commissioner of Education has ordered that license Number 19804 be restored as of July 21, 1947

Yours sincerely, JACOB L LOCHNER, JR., M D, Secretary N Y State Board of Medical Examiners

July 31, 1947

Hypnotism Today By Leslie M Lecron, BA, and Jean Bordeau, Ph D Large duodecimo of 278 pages New York, Grune & Stratton, 1947 Cloth, \$4 00

#### REVIEWED

Medical Uses of Soap A Symposium Edited by Morris Fishbein, M D Second Printing with a new chapter on "The Surgical Uses of Soap" Octavo of 195 pages, illustrated Philadelphia, J B Lippincott, 1946 Cloth, \$3 00

This is a Symposium by twelve writers best qualified to discuss the subject. In a book of but 195 pages is contained more real information concerning soap, its manufacture, and its uses in medicine than one might imagine could be found to tell on so simple an article of daily use. In this, the second edition, the editor, Dr. Morris Fishbein, has added a supplementary chapter on its uses in surgery.

#### NATHAN THOMAS BEERS

Endocrine Function of the Hypophysis By Harry B Friedgood, M D Edited by Henry A Christian, M D Octavo of 240 pages, illustrated New York, Oxford University Press, 1946 Cloth, \$4 50 [Reprinted from Oxford Loose-Leaf Medicine]

This book is written by a distinguished research worker in the field of endocrinology. It gives an excellent description of the anatomy and embryology. The biochemistry of the unknown hypophyseal

hormones is portrayed in a stimulating, intensive, and clearly delineated fashion. The clinical syndromes are tersely described and pictured

It is highly recommended to those physicians who are interested in obtaining an excellent conception of the complex pituitary disorders

BERNARD SELIGMAN

Their Mothers' Sons The Psychiatrist Examines an American Problem. By Edward A Strecker, M D Octavo of 220 pages Philadelphia, J B Lippincott, 1946 Cloth, \$2 75

Reasons for the present legion of mental invalids are analyzed in this briskly written interesting volume

"Moms" with their silver cords are taken to task as major factors in the maladjustment of their children "Moms in pants," some of our social institutions which permit "moms" to flourish, and overprotective influences in general are attached

overprotective influences in general are attached Not all the criticism is destructive, advice on child training is given to both teachers and parents

There is much psychiatric wisdom in this volume which will repay any interested reader

ARTHUR J LAPOVSKY [Continued on page 2358]

# NOW

Romansky Formula in FLUID Form

Wyeth fluid penicillin (calcium) in oil and wax—true Romansky Formula—is now available to physicians at all pharmacies Its advantages are important—

Standard Blood Levels

No Refrigeration—keeps its full potency at room temperature

No Preheating-remains fluid at room temperature

The first fluid Romansky formula-developed by Wyeth

WYETH INCORPORATED

PHILADELPHIA 3, PA

[Continued from page 2356]
The Medical Clinics of North America Philadelphia Number November, 1946 Three-Year Cumulative Index (1944, 1945, 1946) Octavo Philadelphia, W B Saunders Company, 1946 Three-Year Published Bimonthly (six numbers a year) \$16 net, Paper, \$12 net

This issue of the Medical Clinics comprises a symposium of nine articles on cardiovascular diseases, and another of six on clinical pathology Both are good and will add much to the knowledge of the practicing physician Conspicuously excellent are a review of the treatment of coronary disease by Francis Wood, characterized by extraordinary common sense, and a review by Neefe of hepatitis which must surely be the most definitive clinical review of the subject to date

MILTON PLOTZ

Textbook for Psychiatric Attendants By Laura W Fitzsimmons, R.N Octavo of 332 pages, illustrated New York, Macmillan Company, 1947 Cloth, \$3 50

This textbook is clearly and concisely written in simple language. It is set up in outline form and directions can be carried out without difficulty

More illustrations would add to the value of the text, as it is difficult to visualize such procedures as The purpose of the the application of restraints book is well carried out and it should be a valuable textbook for attendants in this field

MARIE M BEHLEN

Principles in Roentgen Study of the Chest. By William Snow, M D Quarto of 414 pages, illustrated Springfield, Illinois, Charles C Thomas, 1946 Cloth, \$10

From the wealth of clinical material observed over many years, the author has selected approximately five hundred films for reproduction and comment Despite the inadequacies of x-ray reproductions, the medical student and the general practitioner can profit greatly by a careful study of the illustrations and a perusal of the accompanying text. In a limited space, the author has compressed much valuable data. For those whose experience has been more extensive, this volume serves well for a rapid review of the roentgenology of the thorax The text is interesting and frequently provocative However, when statements are made regarding the relationship of vitamins to the development of atherosclerosis and cancer, one wonders whether this discussion properly belongs in a volume on roentgen study and interpretation

MILTON R LOUBIA

The Medical Clinics of North America. Boston Number September, 1946 Octavo Philadelphia, W. B Saunders Company, 1946 Published Bi-Cloth, \$16 net, monthly (six numbers a year) Paper, \$12 net

The Medical Clinics of North America, as usual, stresses important clinical material of interest to all practicing physicians Two excellent articles are Cooley's anemia (Ross) and coronary occlusion The latter, particularly, is useful as it helps explode some notions on the usefulness of recent drug therapy Streptomycin is reviewed by Keefer, while Ingelfinger has a fine study on the treatment of infectious hepatitis. There are other good references to lung disorders, laboratory tests, virus diseases, and the use of bilateral femoral vein ligations in thrombophlebitis

ANDREW BABEY

Textbook of Medical Treatment by Various Authors Edited by D M Dunlop, M.D., L S. P. Davidson, M D, and J W McNee, M D Fourth Edition Baltimore, Williams & Wilkins Company, 2 (c 1946) Cloth, \$8 00

The fourth edition of this standard Scottish text maintains the high level of excellence set by its predecessors Although this volume will not supplant its American equivalents, it would be hard to match the uncommon, common sense with which it 35 is written and the exquisite clinical judgment of its contributors

The section on diabetes written by Dunlop is Canaral MacCalman's Psychotherapy in General' Practice also deserves special mention

In short, no one will read this volume without profit, and it is recommended highly

MILTON PLOTZ

Operative Gynecology By Richard W Te Linde, M D Quarto of 751 pages, illustrated. Philadelphia, J B Lippincott, 1946 Cloth, \$18

In line with the author's conviction that the gynecologist must be trained in a comprehensive field, this text includes chapters on the anus and rectum, operative injuries to the ureters, retroperitoneal tumors, surgery of the abdominal wall, particularly hermorrhaphy, appendicitis, and the intestines in

relation to gynecology
The book is well illustrated by 309 line illustrations in black and white, and 15 subjects in full, color on 9 plates The author has been particularly fortunate in procuring illustrations by the famous. medical illustrator, the late Max Broedel, and pupils of his school of medical art. The principal artist is James Didusch, whose illustrations describing various stages in operative procedures are clear and informative

Dr Te Linde's book is a most valuable addition to the texts on operative gynecology and brings the subject up to date It is admirably suited to the needs of residents in gynecology and those who are forced to rely principally on self-instruction for training. The years of experience of the author in one of the foremost gynecologic clinics in the country makes his personal views for the most part authoritative. The text is highly recommended to the profession

ALEXANDER H ROSENTHAL (

The Differential Diagnosis of Jaundice By Leon 3 Schiff, M D Octavo of 313 pages, illustrated. Chicago, Year Book Publishers, 1946 Cloth, \$5.50

This excellent book serves a valuable purpose in integrating the present day concepts, diagnostic measures, and recent advantages in the therapy of jaundice It is complete, well written, and contains a wealth of information The author has performed an excellent service in presenting a subject that is in such a state of transition that there is apt to be some confusion in many minds concerning the best procedures to follow in each individual case 'It should be well received

VICTOR GROVER

Renal Hypertension By Eduardo Braun-Menéndez, Juan Carlos Fasciolo, Luis F Leloir, F et al Translated by Lewis Dexter, M.D. Octavo of 451 pages, illustrated Charles C Thomas, 1946 ( Springfield, Illinois, th, \$6 75 Cloth, \$6 75

This is an extremely good, thorough review of the development of our knowledge of renal hypertension

[Continued on page 2860]

November is a Par-Pen month

#### PAR PEN provides:

- The antibacterial action of penicillin
- The vasoconstriction of 'Paredrine'
- 3 Therapeutically ideal pH 4 Wide margin of safety

[Continued from page 2358]

It is written by investigators in Buenos Aires, Argentina, who themselves have done much to elucidate the many problems associated with this disorder. Not only is there information on the development of studies of renin and angiotonin, but a very adequate summary covers advances in medical and surgical management, including the Smithwick operation.

A great number of aspects of this big problem remain to be solved, but a review of this type serves a most useful purpose in focusing our attention in simple fashion on the points which internists ought

to know

ANDREW BABET

Lehrbuch Der Urologie By Dr J Minder Octavo of 348 pages, illustrated Bern, Switzerland, Medizinischer Verlag Hans Huber (New York, Grune & Stratton), 1946 Cloth, 37 50 Sw fr

The fact that the author while writing this book was deprived of the use of his own library and notes explains the absence of any references and bibliography. The various problems are skillfully handled. Their descriptions are conspictions by the fine differential-diagnostic interpretation and short, but pertinent, case histories. Without belittling the diagnostic and therapeutic value of local manipulations and operations on the lower urmary tract, the author emphasizes restraint, unless positive indications request them. The clear presentation makes this book good reading for any student in this line

MAX G BERLINER

Ulcer of the Stomach, Duodenum and Jejunum By Ralph C Brown, M D Edited by Henry A Christian, M D Octavo of 105 pages, illustrated New York, Oxford University Press, 1946 Cloth, \$2.25 (Reprinted from Oxford Loose-Leaf Medicine)

This is an admirably compact monograph on a subject with a tremendous literature. The illustrations and tables are quite clear. The therapeutic emphasis is on the group of seriously ill patients who are logically hospital patients, and the regimen for this group is well documented and soundly based on pathologic physiology.

This little volume is highly recommended

MAURICE TULIN

A Textbook of General Biology By E Grace White, Ph D Third Edition Octavo of 659 pages, illustrated St Louis, C V Mosby Company, 1946 Cloth, \$4 50

This revision, after nine years, maintains the general plan and technic of the previous edition but is brought up to date by including a discussion of the use of results obtained by modern methods of investigation—especially radioactive isotopes

The book is logically and pedagogically sound and presents an interesting selection of topics in addition to the material included in a "standard" course in general biology. The text is clear and interesting, and illustrations are abundant and well chosen.

ARTHUR SHAPIRO

Clinical Hematology By Maxwell M Wintrobe, M D Second Edition Octavo of 802 pages, illustrated Philadelphia, Lea & Febiger, 1946 Cloth, \$11

The second edition of this comprehensive work on hematology meets all the requirements of the medical student, internist, and general practitioner. For completeness and authoritativeness there is no comparable book on hematology. The bibliographies at the end of each chapter are well chosen and make the problem of the reader a pleasant one. The many charts, photographs, and engravings are well done.

MAURICE MORRISON

Manual of Applied Nutrition, The Johns Hopkins Hospital Second Edition Duodecimo of 103 pages, illustrated Baltimore, Dietary Department of Johns Hopkins Hospital, 1946

This is a small pocket sized handbook containing much useful information on diets in therapy. Starting with basic requirements of the various foods, minerals, and vitamins, it goes on to very specialized diets without too much distracting detail or confusing references. It is a handy volume based on sound principles

ANDREW BABEY

Studies in Hypertony and the Prevention of Disease By I Harris, M D, in cooperation with J T Ireland, B Sc, and others Duodecimo of 114 pages, illustrated Baltimore, Williams & Wilkins Company, 1946 Cloth, \$3.00

This monograph consists of observations made on middle-aged normal and hypertensive patients as well as some experimental studies on rabbits. The authors attempt to determine the influence of dietary calcium and cholesterol on the development of hypertension. Also considered are certain relations of potassium, iron, phosphorus, calcium, and sulfur metabolism.

The data are not well presented and the conclusions drawn frequently unjustified. The interpretations of some experiments are little short of extraordinary. The book is not recommended.

DUNCAN W CLARK

Principles and Practice of Obstetrics By Joseph B De Lee, M D, and J P Greenhill, M D Ninth edition Large octavo of 1,011 pages, illustrated Philadelphia, W B Saunders Company, 1947 Cloth, \$10

In this latest edition, Dr Greenhill has brought De Lee's textbook thoroughly up to date. His wide acquaintance with current obstetric literature is constantly evident. Although containing statements to which many obstetricians will take exception, it will serve, in general, as an excellent guide to practitioners as well as a textbook for students. It is copiously and well illustrated. It contains up-to-date and accurate information on chemo- and anti-biotic therapy

J THORNTON WALLACE

Victory Over Pain. A History of Anesthesia. By Victor Robinson, M D Octavo of 338 pages, illustrated New York, Henry Schuman, 1946 Cloth, \$3 50

The history of anesthesia is well depicted in this clearly written and finely illustrated volume. The ever-interesting story of the slow development of anesthesia has been written entertainingly by Dr Robinson, who has explored a large number of source materials in order to render the volume accurate. The sections on Jackson and Morton are historically perfect and the conclusion on curare brings the book up to date

#### SUGGESTIONS FOR CONTRIBUTORS TO THE NEW YORK STATE IOURNAL OF MEDICINE

The New York STATE JOURNAL OF MEDICINE asks its contributors to follow the suggestions listed below in the preparation of their articles way they will greatly facilitate the expeditious publication of the Journal. These suggestions have heen devised in order to save correspondence, avoid return of papers for changes, minimize the work of preparation for the printer, and save the high costs of corrections made on galley proof

Size of Articles -It is earnestly desired that scientific articles shall not exceed 6 Journal pages at the outside Longer articles tend to lower reader An average of five or six seems to be the most desirable from this point of view Calculation can readily be made by multiplying the number of double-spaced typewritten manuscript pages by the fraction two-fifths, e g, twelve manuscript pages will make five Journal pages

Manuscripts -- Papers must be typewritten on one side only of white sheets consecutively numbered, and be double spaced with one-inch margins They should be prepared with great care so as to be typographically correct All headings, titles, subtitles, and subheadings should be typed flush with the left-hand margin. This is imperative for rapid and accurate composition by the printers

Titles —The title should be brief and typed in capital letters The subtitle can be longer and should be typed in caps and lower case letters Under the title, or subtitle, if there is one, should appear the name of the author and city in which he lives Directly under his name should be the hospital or institution with which he is affiliated

Subheadings —Subheadings should be inserted by the author at appropriate intervals

References -It is the unfailing practice of the NEW YORK STATE JOURNAL OF MEDICINE to use specific "references" rather than "bibliography" There should appear in the text reference numbers, typed above and to the right of the word to which there is a reference A list, consecutively numbered, of these references should follow at the end of the manuscript (Note that spelling in list is same as in text) The arrangement should be as follows and should include all items

Books-author's surname followed by initials title of book, edition, location and name of publisher, year of publication, volume, and page number Thus, Osler, W Modern Medicine, 3rd ed, Philadelphia, Lea & Febiger, 1927, vol. 5, p. 57

Periodicals—author's surname followed by

initials, name of periodical, volume, page, month (day if necessary), year of publication Thus, Leahy, Leon J New York State J Med 40 347 (March 1) 1940

The JOURNAL does not include titles of Nore articles

Case Reports -- Instead of abstracts of hospital histories, authors should write these reports in a narrative style with properly completed sentences All unimportant details should be deleted with such general negative statements as fit the case

Tables -- While tables are very useful on lantern slides in the reading of papers, they fail of this pur-pose to a large extent in the printed page For that reason it is urged that they be reduced as much as possible to descriptive language

Illustrations -These should be kept to the minimum necessary to make clear the points to be registered by the author In some instances they are imperative to proper understanding, in others they are merely picturesque. The latter can be excluded to good effect, both as to space and the not inconsiderable cost

When illustrations are to be used they should

accompany manuscripts and each should always be referred to in the text, preferably by number Drawings or graphs should not be larger than 12 X 16 inches, and must be made with jet black India ink on white paper Do not use typewriter for letter-The smallest lettering on 8 × 10 inch copy should be no less than 1/4 inch high Cross-section paper (white with black lines) may be used, but should not have more than 4 lines per inch If finer ruled paper is used, the major division lines should be drawn in with black ink, omitting the finer In the case of finely ruled paper, only blue-lined paper can be accepted. Lettering and all markings must be large enough to be readable after reduction Mail rolled or flat, never fold Photographs should be very distinct and show clear black and white contrasts They must be on glossy white paper Avoid round and oval photographs

Whenever possible "crop" photographs, i e, mark portion that can be excluded when reproduced Crop marks should be on margin of photographs Do not run pencil lines through photographs

It is important to mark the top of the illustration on the back, also its number as referred to in the text, thus, Fig 1, 2, and the name and address of the

Legends should be typewritten on one sheet of paper and attached to the illustrations

Clinical studies concerned with the use of Glycerite of Hydrogen Peroxide in the treatment of chronic purulent offices media demonstrated seventeen of twenty-nine patients in complete remission in 14 days and the remainder by the 38th day. The patients studied presented conditions existent for periods of 2 weeks to over 40 years. Previous treatment by the usual therapeutic means, including tyrothricin or penicillin, was ineffective in all cases.

#### Constituents

Literature on request.

Hydrogen Peroxide 1 446%, Urea (Carbamide) 2 554%, 8 Hydroxyguinoline 0 1% Dissolved and stabilized in substantially anhydrous glycerol qs ad 30cc

Available on prescription in one-ounce bottle with dropper Administration. One half dropperful two to four times daily

International PHARMACEUTICAL CORPORATION

# Experience is the Best Teacher

EXPERIENCE during the wartime cigarette shortage taught smokers the differences in cigarette quality. In those days, people smoked -and compared-many different brands. That s the experience from which so many smokers learned that Camels suit them best. As a result, more people are smoking Camels than ever before.

Try Camela! Let your taste and throat tell you why with millions who have tried and compared, Camels are the choice of experience!

According to a Nationwide survey

More Doctors smoke Camels

# DO YOUR DIABETIC PATIENTS COOPERATE FULLY?

A vital phase of diabetes management is the daily testing and recording of the patient's urine-sugar. At one time this involved such inconvenience, loss of time and technical difficulty as to lead to carelessness and lack of full cooperation by the patient. But these objections have been completely overcome with the introduction of—

Supplied-in 71/2 grains with and without Phenobarbital 1/2 grain, in 5 grains with Potassium Iodide 2 grains and Phenobarbital 1/2 grain and in 32/4 grains with and without Phenobarbital 14 grain. Capsules not enteric coated, are available in the same potencies, for supplementary medication.

The ORIGINAL ENTERIC COATED TABLET OF THEOBROMINE SODIUM ACETATE

## to control frequency and severity of attacks in CARDIOVASCULAR AND RENAL DISEASES and to prevent EDEMA

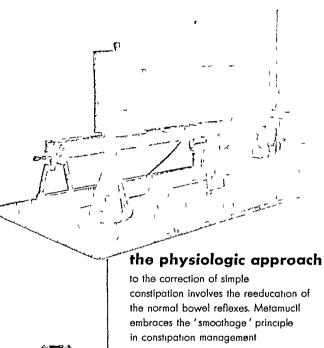

Clinical experience and studies have proven the value of Theobromine Sodium Acetate in certain Cardiovascular and Renal Diseases In Angina Pectoris, used adequately, it permits more work by the individual without developing precordial pain or distress. As one of the most effective Xanthine Vasodilators it helps increase the available blood supply to the heart and kidneys to increase the efficiency of these organs

It has also been found an effective aid in treating and preventing Edema of Cardiac or Renal origin. The enteric coating (especially developed for Thesodate) permits larger doses without the drug's contact with the Gastric Mucosa

Food allergy is a common but not easily diagnosed cause of digestive tract distress. If the offending food cannot be avoided. symptomatic relief of the spastic manifestations of proven or suspected gastrointestinal allergy pylorospasm, spastic constipation, spastic colitis, etc.-may be obtained through the use of Mesopin.

Mesopin is a specialized antispasmodic whose action is predominantly directed toward the gestrointestinal tract. Its selective action permits more direct management of hyperactivity and spasticity without causing the undesirable and uncontrollable effects of atropine, belladonna, or related antispasmodics.

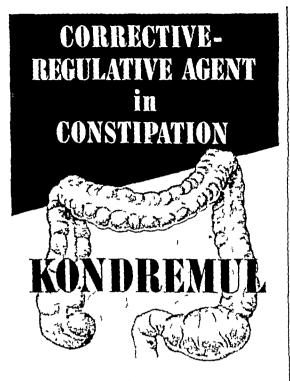

Mesopin is available on prescription in bottles of 100 tablets, each tablet containing 2.5 mg (1/24 gr ) homatropine methyl bromide.

Mesopin brand of homatropine methyl bromide

One of America's most complete technical libraries serving private food industry is this library of Carnation's Research and Development Department in Milwaukee. It is a focal center of intensive and unremitting research, directed toward improving the quality of Carnation Evaporated Milk and other Carnation products. The high reputation of Carnation Milk as a food for infants is firmly founded on such scientific inquiry, and on a determination to provide highest quality and utmost uniformity with every can of Carnation Milk. This milk that every doctor knows is milk that every doctor may trust.

the Wilk EVERY DOCTOR KNOWS

HEAT REFINED—forming fine soft, flocculent low tension curds,

HOMOGENIZED—wi h butterfat minutely subdivided for easy assimilation

FORTIFIED—containing pure crystalline vitamin D<sub>2</sub> 400 U S.P. units per pint.

STANDARDIZED—for uniformity in fat and total solids content.

STERILIZED—after hermetic sealing insuring bacteria free safety and markedly diminished allergenic properties

### In Constipation—True or Alleged It's MUCILOSE

When the patient who declares himself constipated has made a mountainous problem of over purgation from a modeful of underlying cause, Mucilose—bland, lubricating bulk—is a valuable adjunct in correcting both the self-imposed laxistive babit and the primary intentinal dyfunction.

Ample intestinal bulk is assured by placing the patient on Mucilosepure, concentrated hemicellulose from psyllium. More efficient Mucilose absorbs 30 times its weight of water to form a bland colloidal gel-hibricares the intestinal contents and gently stimulates peristalsis.

For physiologic re-education for more nearly normal evacuation and a regular "habit-time — h" s Almilies

### Mucilose

IN SPASTIC AND ATOMIC CONSTIPATION Highly purified bemicribilose concentras, derived from Plontey berlinght syntholies as flakes or granules in 4 oz, bordes and 16 ex, considers.

A trial supply of Mucilose will be sent to year upon request.

# THANKS!!

THE PHYSICIANS' HOME received this letter from an officer of a component medical society

"I share with a number of my associates a genuine conviction that your modest instrument of service, the Physicians' Home, is doing one of the best possible jobs in human adjustment of which I know

This idea of helping one's own immediate colleagues and their widows in their own home communities gives the kind of direct personal help that tide them over crises and safeguards their future

You have established a broad base to assure this service to the aged, retired members of our profession "

# a Palatable protein hydrolysate

Aminogran Bristol answers the patient's most frequent objection to the use of oral protein supplements Within limits defined by the nature of the material itself, Bristol has imparted to the granules a rich, meaty flavor which remains acceptable on prolonged administration

Aminogran is a balanced combination of free amino acids and polypeptids. It is derived from partially hydrolyzed yeast protein, with 14% added lactalbumin. All of the essential amino acids are present in proportions best suited to optimum utilization, together with natural minerals and B complex vitamins from brewer's yeast.

In addition to 64% protein and 23% carbohydrates, the average daily dose of Aminogran (4 tablespoonfuls-50 grams) provides

### SYSTEMIC

# ...Even in advanced stages of arthritis

Even in advanced stages of arthritis when many patients consider themselves incurable, a complete rehabilitation program can do much to restore function and abolish pain

Darthronol is an important integral part of such a rehabili-

tation program. It combines the repeatedly demonstrated beneficial antiarthritic effects of massive dosage vitamin. D with the general systemic actions of eight other vitamins—the need for which is greater in arthritics than in normal individuals

## FACH CAPSULE CONTAINS:

Vitamin D (Irradiated Ergosterol)	. 50,000 U S P Unit
Vitamin A (Fish-Liver Oil)	5,000 U S P Uni
Ascorbic Acid	75 mg
Thiamine Hydrochloride	3 mg
Riboflavin	2 mg

successful active type-specific
\ immunization against
\ pneumococcal pneumonia

"The evidence demonstrates clearly that immunization of man with the specific capsular polysaccharides of pneumococcus types I, II, V, and VII is effective in preventing the development of pneumonia due to these types in the immunized subjects" 1

1 MacLeod C. M. Hodges R G, Heddelberger M, and Bornhard W G J Exp Med 82 445 (Dec. 1) 1915

Photomicrograph of DIPLO COCCUS PNFUMONIAF (magnified I 350 times), after 'typing with homologous an tiserum by Neufeld method The swollen unstained sharply outlined capsules contain the type-specific polysacchar ide, which is mixed with similar antigens from other types of pneumococci in the preparation of Solution of Pneumococcus Polysaccharides

In the above mentioned investigation on 17,035 subjects with a preparation made by Squibb, pneumonia of the types represented in the vaccine was entirely eliminated in the immunized group (8,586), excepting for four cases which developed before specific immunity had been established. And in the non-immunized group of 8,449 controls, all of whom were closely associated with the immunized group, the incidence of these types of pneumonia was greatly lowered through the reduction of "carriers" Reactions were mild. The slight arm soreness reported by those injected lasted only 3 to 4 days.

### Solution of

### PNEUMOCOCCUS POLYSACCHARIDES

Type-specific

supplied in two combinations of types to which adults and children, respectively, are generally most susceptible

COMBINATION A Containing types 1, 2, 3, 5, 7 and 8 (Primarily for adults)

COMBINATION B Containing types 1, 4 6, 14, 18 and 19 (Primarily for children)

DOSAGE A single subcutaneous injection of 1 cc for adults, or children over 12 years of age, 0.5 cc for children under that age Immunity usually develops within 6 to 9 days and is effective for at least one year

AVAILABLE Each combination supplied in 1 cc. and 5 cc rubber-stoppered vials

Professional leaflet, "Active Immunization Against Pneumococcal Pneumonia" is available upon request.

# How to make Special Diet patients happy!

For the Peptic Ulcer, Colitis or Diabetic patient the diet is special and, usually, rigid

HOWEVER with Knox Gelatine it is casy to prepare dishes within the limits of the prescribed diet that make the patient happy From a psychological as well as a health standpoint this is extremely important.

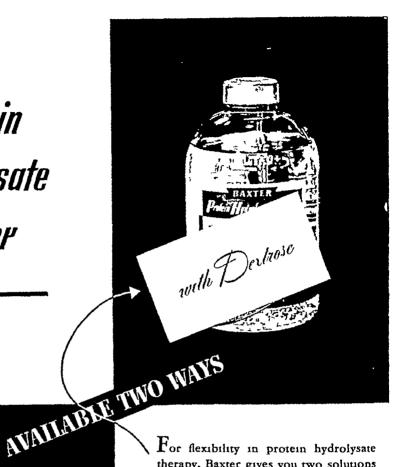

Pure, unflavored Knox Gelatine can be used in the widest variety of different dishes many of them made with real fruits or vegetables flavored with their good, natural juices

Knox Gelatine, unlike flavored gelatine dessert powders which are 1/2 sugar artificially flavored and acidified is all protein contains no sugar

If you wish free diets and recipes write to Knox Gelatine, Dept. 474, Johnstown, N Y

# Protein Hydrolysate Baxter

For flexibility in protein hydrolysate therapy, Baxter gives you two solutions—5% Protein Hydrolysate and 5% Protein Hydrolysate with 5% Dextrose Autoclaved to assure sterility, these solutions meet the same high standards applied to all Baxter products

The unique flexibility is characteristic of the integrated Baxter program of parenteral therapy with its wide selection of solutions, equipment and standardized procedures. No other method is used by so many hospitals. Write for full information and literature

An outstanding characteristic of

# MANDELAMINE

Reg. U S Pat Off

(Methenamine Mandelate)

Mandelamine is supplied in enteric coated tablets of 0.25 Gm (3% grains) each, in packages of 120 tablets, sanitaped, and in bottles of 500 and 1000

Mandelamine, a highly efficient urinary antiseptic, is virtually nontoxic in effective therapeutic dosage. This remarkable lack of toxicity, as established and confirmed in a number of authoritative clinical studies, facilitates therapy and eliminates the necessity for careful selection of patients. Its safety and ease of therapy make Mandelamine espe-

cially suitable for administration to children, during pregnancy, and in stubborn or inoperable cases where therapy is necessarily prolonged. The only major contraindication to Man delamine therapy is renal insufficiency

Manufacturing Chemists

Yonkers 2 New York

The combination of

Sulfamerazine Microcrystalline 1.5 Gm (22 gr) Sulfadiazine Microcrystalline 1.5 Gm (22 gr)

is presented in Mer Diarine. Equal parts of sulfamerazine and sulfadiazine have been found by Flippin et al' to lead to a markedly decreased incidence of crystalluria compared with that observed when either compound was administered singly. The use of sulfonamide mixtures avoids certain disadvantages associated with the administration of sodium bicarbonate.

#### Liquoid Mer-Diazine

presents a palatable homogenized suspension of these two sulfonamides. The microcrystalline form in which the drugs are present assures the most rapid absorption slow excretion of sulfameranne makes maintenance of a suitable blood level relatively simple both sulfas penetrate readily into ascitic, pleural and cerebrospinal fluids Liquoid Mer Dizzine provides convenience in administration—particularly useful in pediatrics Warning Sulfadiazine and Sulfamerazine may cause toxic reactions

Available in 4 fl. oc. and pint bottles. Samples on request,

# FOR BETTER NUTRITIONAL HEALTH IN THE AGED

Impaired strength and poor general health in the aged, which have so erroneously become associated with senility, are in reality often due to no more than a state of subnutrition Food dislikes, personal idiosyncrasies, masticatory difficulties, and digestive abnormalities are the usual contributing factors. The use of an easily digested, nutritious food supplement can do much in preventing these nutritional deficiencies, and in giving new strength and vigor to patients well advanced in years.

The delicious food drink made by mixing Ovaltine with milk is advantageously employed in augmenting the nutrient intake of the aged. This well rounded dietary supplement imposes no digestive burdens, and provides in generous amounts the very nutrients needed. Because of its low curd tension, it leaves the stomach quickly, and is easily digested. The table indicates its rational nutritional composition. Two or three glassfuls daily bring to full nutritional acceptability even a fair diet.

## A word in the Ear about the Nose!

Phenylephrine Hydrochloride Solution is now made available by Breon.

What is Phenylephrine Hydrochloride? It's the nasal decongestant without reproach. More stable than epinephrine, with a greater range of safety than ephedrine, Phenylephrine Hydrochloride-Breon reduces swollen mucous membranes The action is comparatively enduring, with its effectiveness being undiminished by repeated use. Vasoconstriction occurs promptly with virtual freedom from side effects Phenylephrine Hydrochloride-Breon is chemically identical with the product sold by Frederick Stearns and Co., Division of Sterling Drug, Inc., under the registered trademark Neo-Synephrine.

> Phenylephrine Hydrochloride-Breon, by clearing the nasal airways, aids sinus drainage in head colds, vasomotor rhinitis, and sinusitis It eases the harassed patient—one of those trifles that-done or neglectedmake a physician liked or-the reverse.

#### Plain Talk, I Rising Costs of Medical Service

Is the rising cost of living a threat to the continuation of private enterprise in medicine? All over the world the peoples of the earth have experienced a retrogression in standards of living due to underproduction and rising price levels. Only in the United States has this phenomenon so far been moderate, but acceleration in the process here is even now beginning.

Medical service embraces the cost of professional fees (doctors' and nurses' bills) and, what is more important, the cost of ancillary services (hospital and laboratory, supplies of all kinds, food, coal or oil, transportation, equipment, wages of employees, and the like) Previously we have pointed out that in thinking of medical service it is necessary to segregate professional and ancillary services.

Professional fees are fixed many of them by statute, others by custom and use. The public does not understand this fact, partly because the medical profession does not usually trouble itself to inform people on this point.

Ancillary services, on the other hand, fluctuate in cost and are relatively free to do

so Certain brakes, such as hospital insurance for example, may operate to smooth out violent fluctuations in these costs, certain Federal, state or local subsidies may help also, but on the whole, rising costs of medical service will fluctuate with the costs of the ancillary services

It is important that this be understood. The medical profession, and particularly what is referred to as 'organized medicine,' will undoubtedly be charged in the future, as it has been in the past, by the unthinking, with failure to control the costs of medical service. This will be twisted, for political purposes at least, to mean failure of organized medicine to fulfill its social obligations to the people. Popular magazine writers, political hack writers, assorted nuts of all kinds who can push a pencil for hire will beliabor the subject, on the ground that "they have to live, don't they?"

Of course, the cost of medical service as a whole will follow the trend of the national economy, it will rise as living costs soar Regrettable but true. There is no magic about it, but it will not be because of in-

creased professional fees. This should be brought to public attention by organized medicine. This is not to say that *volume* of professional service will not rise as people demand more service. It will But again, increased *volume* is and will be engendered by public insistence, not by medical professional instigation.

Nearly all the blame for increasing costs for total medical service, therefore, may be laid squarely on the ancillary services where it belongs Control of these ancillary service costs lies in the hands of the public, not in those of organized medicine. But unless this separation of and distinction between professional and ancillary services is made clear to the public, it will continue to regard them as one and the same thing. Medical information services, public relations bureaus of the various state societies, and individual physicians should leave no stone unturned in making this distinction understood.

#### Our Coming Psychiatrists

Apparently, the Surgeon General of the United States Public Health Service proposes, according to the New York Times for July 27, 1947, to devote an appropriation of some \$4,650,000 to the further psychiatric training of social workers

"Candidates must be graduates of an accredited school of social work and must have had at least three years of practice in the profession

"The training units to be started in the various graduate schools conform to a plan now being developed by the United States Public Health Service for a comprehensive nation-wide mental health program under recently enacted health measures"

We shall watch this development in the further training of social workers in the field of psychiatry with much interest, tinged with apprehension

Training of social workers in psychology and psychiatry in order to fit them to aid in a comprehensive, nation-wide mental health program is not without its grave dangers in our view. A social worker who meets the above requirements for preliminary schooling and practice is a more highly educated and more experienced person, but a social worker still

At the present level of training in this field a useful and generally well-balanced individual enters the profession of mass management of human affairs with generally creditable results, as the work of many thousands of workers in departments of public welfare will daily attest

Once upon a time, before it became somewhat overtrained, the same thing could be

said of the nursing profession it nursed, with a sympathetic human understanding of the requirements of sick folks, at the bedside and in the home *Eheu*, fugaces!

Now, with the addition of psychiatric training to the social worker's schooling as proposed, what is likely to be the outcome? If the trainees are to be assistants to the physician psychiatrists in veterans' mental hospitals, working under the direction of the medical profession, that is one thing. Unquestionably, better psychiatric case histories would be advantageous for all concerned, as would more intelligent follow-up of discharged patients.

On the other hand it is already being recognized by writers in the popular journals1 that there is danger in too much emphasis on disease by those not too well qualified to call attention to it trouble is we've scared the living daylights out of people The cancer people keep telling everybody to 'thump that lump' But when we go around telling everybody to take their psychiatric pulses—we are spreading the very disease we are supposed to fight And we've been doing it-with the aid of a lot of amateurs who write books produce movies, and scream over the radio "1

Remember the dancing mania? Remember the Children's Crusade? We do not like to think of ourselves as embarking on a witch hunt, but education in mass psychology may have marvelous results Remember Mussolini? Remember Hitler?

<sup>&#</sup>x27;Maisel, Albert' 'Relax You May Not Be Nuts,'' Collier's Weekly August 16 1947

#### "Madam, Will Your Nose Never End?"

Sir Joshua Reynolds is said to have made the foregoing remark to the famous lady he was painting

We know just how he felt We read this morning in the report of the House of Delegates of the American Medical Association that it had voted to set up a Section on the General Practice of Medicine and, moreover, to establish an examining board to determine the qualifications of diplomates who might be admitted to practice general practice in the wards of our hospitals <sup>1</sup>

We are all in favor of widening the horizon of the general practitioner. We have already said so editorially <sup>2</sup>. We think that, like the Trumpeter Swan, he is a vanishing species, which should be most carefully protected and encouraged to breed. Notice that we did not say "sheltered." Sheltered species do not survive

But examine this latest proposal A medical student studies a fairly carefully standardized course for four years. He then passes his State Board Medical examinations He, then, if he is so fortunate, serves a two years' internship in a hospital approved by the American Medical Association and/or by the American College of Surgeons

He, then, might be supposed to be equipped to practice medicine with a reasonable knowledge of surgery, or surgery with a reasonable knowledge of medicine. If he is wise enough not to decide immediately upon a speciality, he will browse about in the plain business of looking after sick people until such a time as he determines that he wishes to engage in practice of a speciality.

If he does so, then he will be constrained to enter upon an enormously complicated course of further training which will qualify him in his chosen specialty. After he has done that he then will have to submit himself to examination by a Specialty Board This, if he is successful in answering not only their complicated questions, but their requirements as to various residencies, years in practice, etc., will grant him a certificate which proclaims him a diplomate in his

particular specialty If he can have afforded the time and money involved in this process he may then, we presume, go anywhere he likes and engage in lucrative practice in a sphere quite removed from his unlettered—we mean his undiplomated—brethren Of course, in the meantime, he will have passed the tests of the National Board of Examiners This, he thinks, will give him a license to practice anywhere But, no, there are still three states that do not accept the Certificate of the National Board. Pretty pathetic

But now our heart really begins to bleed Suppose he has just been plugging along, looking after sick people, doing the best he could in his small community, earning the respect of his fellow citizens. Perhaps his neighbors say of him, "Maybe Dr Jones don't know so much, but he knows what he knows and he knows what he doesn't know. And he ain't afraid to say so, neither. When my girl got a mastoid he sent me to a man he knew who cured her. That's the kind of a man I want."

We think the judgment of Dr Jones's neighbors is sound But is Dr Jones now to be secure? No If he wishes to be allowed to have his patients admitted to the hospitals of his community he must now qualify as a general practitioner Poor wretch That is what he had thought he had been for many years. His neighbors had been satisfied with his services. He had been fairly satisfied with himself But now the hospital trustees, guided by the omnipotent and omnipresent hands of the A.M.A and the A.C.S, te'l him that if he wishes to practice in their wards he must go far away and take an examination by a Board of what? Gen-That's what he had been eral Practitioners And who are thinking he was all the time the general practitioners who are to examine the general practitioners?

The exact text of the adopted A.M.A resolution reads

The criterion of whether a physician may be a member of a Hospital Staff should not be dependent on certification by the various Specialty Boards or membership in special societies

<sup>&</sup>lt;sup>1</sup> Bull, Am. Coll, Surg. 32: 149 (June) 1947

<sup>2</sup> The Wider Horizon for the General Practitioner New York State J Med. 47: 1479 (July 1) 1947

Mark the masterly use of that most overworked of all words, should Perhaps they shouldn't, but they will be We can see already the cocked eyebrow of the diplomate as he mentions to a trustee the unfortunate parchmentless condition of a rival candidate

And so we go, round and round From examination to examination Farther and farther away from a man's privilege to be judged by his peers, those men of reasonable

common sense with whom he lives and who entrust their wives, their children, and themselves to his medical and surgical judgment. The fact that he has pulled them through many tough spots is not enough. Should Chicago advise the trustees of the hospital in his own home town as to criteria?

And now there is to be a Special Board for the examination of the general practitioner

No wonder Sir Joshua said to Mrs Siddons, "Madam, Will Your Nose Never End?"

#### Fear

We address the remarks that follow to those interested in what we might call the philosophy of education

In our second year in the Medical School anatomy was taught us by a professor of international reputation who was passionately interested in comparative anatomy. He almost cost Oscar of the Waldorf his job, because, when being dined by a wealthy friend, he identified the bones he was spitting out of his mouth as not those of Maryland terrapin, but of squirrels—His accounts of the teleosts being chased out of the primeval slime by the elasmobranchs were fascinating

A student speaker at a medical dinner ventured to criticize him because his lectures were not practical. They taught the future hard-pressed surgeon nothing about where he might lay his fingers upon the inflamed appendix or the obstructed common duct, thereby enabling him to save the life of his patient.

The infuriated professor retorted that he was teaching anatomy for the benefit of the one, or possibly two intelligent students he might chance to find in the Second Year Class And there the matter rested Until the other day It occurred to us, brooding over the problems of a troubled world, that possibly the emotion that most depressed the average human being was Fear

Wartime fear is universally understandable. The fears of so-called peacetime civilian life, which are even more comprehensible, are thought of less often

Fear of hunger, shabbiness, loss of reputation, loss of love Consider the emotional state of a surgeon emerging disabled from an automobile accident Of that of a physician who is being sent to a sanatorium with tuberculosis. He fears not only for himself, but for his wife and his dependents. Whether or not, in either case, his infirmities were incurred in line of duty, there is no "dulce et decorum est pro patria mori" for him. He is a failure, and he and his are going to be burdens on the community for the rest of his miserable life.

Up from the primeval slime of memory comes the impractical remark of that theoretic anatomist whose greatest interest was in comparative anatomy

The emotion, or whatever you want to call it, which caused the teleosts, from fear of the elasmobranchs, to leave the primordial mud, climb trees, and develop into a new winged species was not Sex, but Fear In case we have reversed the priority of the teleosts and the elasmobranchs we apologize to the comparative anatomist The Encyclopedia Britannica sheds no light upon the subject

In all sober consideration, is not Fear rather than Sex the primitive emotion?

Before the species can be propagated there must be survivors to propagate it "The man who fights and runs away will live to fight another day" He will see that he himself is secure before he lets lust overcome him and turns to the recreation of himself and his species

This is a hundred per cent revolutionary idea. We are knocking Freud and his disciples off their pedestals. But every book, every article that one reads today bears out the truth of the theory. Every trickle that leaks out from beneath the Iron Curtain says that while the Russians may not be very happy under Communism at least they know that they are all in the same boat

Misery is bearable provided that it is common misery. Certainly that is not a very clevating doctrine, nor does it seem a very worthy target at which nations should be content to aim their ambitions. But, to the old, tired, disillusioned, hungry nations of what remains of Western Europe, it is at least an idea. No one seems to take much account of the millions without the pale, even of Communism—of the sturving slaves, the displaced persons, the Jews. They seem to be simply written off the slate

To paraphrase Mr Franklin, Communism seems, except to those fortunate few who happen to find themselves in the drivers' seat, to offer to its followers the somewhat dubious satisfaction of "starving together rather than starving separately". And in order to obtain even that the individual must sacrifice everything he has of conscience, family affection, and individuality in general

Perhaps these elementary fears are well understood and taken into account by the medical profession in its daily contacts with those they fondly refer to as "ordinary people" We don't know, fortunately, how many snobs our profession has in it comparable to the political champion of the "common man," by whose wrongs his heart must be practically exsanguinated. We are sure that the doctor understands not the political but the ordinary troubles of the ordinary man, because he has them all hunself. We are not so sure about the Specialist.

If—or perhaps we should say more accurately—when, we are criticized for wandering afield from the narrow paths of medicine we aver that we are doing no such thing. If these primitive facts were more widely understood by physicians and by people we should not hear the universal frenzied appeals in the public prints of those who want psychiatrists to lean on, and who have none

#### Current Editorial Comment

Changing Customs in Medical Literature The New England Journal of Medical Courses the trend of the past seventy years toward more objective factual documentation in American medical literature. The editors of that excellent publication think this is a commendable step forward "producing clinical articles that are based on tabulation and the case protocols of specifically identified patients rather than on vague impressions". This change springs from more scientific and thorough training of medical investigators in fundamental research.

Some of the color, the vivid language of our ancestors in describing the clinical picture of disease has been lost, perhaps less by some of the English writers who "can report clinical material in a way that brings color, interest and humor to the cases"

Two abuses characterized by the New England journal as "becoming epidemic" are the 'sceretarial bibliography," aptly castigated as "a prostitution of the medical library", adding nothing to the medical literature, and the "puncheard article' This is a product of the machine age and one of which the editors of the New England journal think conservatively less than nothing as it applies to such human beings

When anthropometric data or the distribu tion of age, weight, and height among school children is being dealt with, the use of a puncheard system may yield material of much interest and information When, however, a puncheard statistical device is applied to clinical material that has an extremely variable background, the data that come from the machine may have little or no meaning. The old platitude that a chain is as strong as its weakest link might be paraphrased to state that statistical information on clinical patients is of as great value as the thought that has gone into its selection Merely to analyze a large series of tumors according to whether the patient had red hair or dark hair large ears or small ears and did or did not smoke cigarets adds little to knowledge, even though it yields numbers that have two significant decimal places and adapt themselves well to the drawing up of innumerable charts and graphs. As the anthropologist approaches a statistical problem, for example measurements of head size he puts in his punchcard system all the standard measurements of the skull that can be reproduced these are his varia-He then uses the machine as a device for singling out which of these variables are significant in relation to racial grouping sick human being however demonstrates so many thousands of variables that it is difficult

In Memoriam
Frederic E Sondern, M D
1867-1947

A past president of the Medical Society of the State of New York, well known as a clinical path ologat, Dr Sondern died on October 10, 1947, at the Post-Graduate Hospital, at the age of eighty, after an illness of several weeks. He was born in Stuttgart, Germany, came to this country at an early age, was educated in public and private schools in New York, and graduated from the College of Physicians and Surgeons with the class of 1889. He then served his internship at the old German now the Lenox Hill Hospital. For some years he was associated in practice with Dr Abram Jacobi and, subsequently, at the instigation of several of the outstanding physicians of that time, he founded and developed "The Clinical Laboratory" which achieved great prominence in being patronized by the leading medical men of the country

Dr Sondern became affiliated with the Post-Graduato Hospital, where he occupied the chair of clinical pathology from 1901 to 1923 He was also connected in this capacity with Roosevelt and Bellevue and served as Director of Laboratories at the New York Lyng In Hospital for many years

In 1935 he retired from active work.

During the greater part of his professional life Dr. Sondern interested himself in the work of organized medicine. He was President of his County Society in 1910, of the State Society in 1931, and a delegate to the American Medical Association for a long period. His membership in the Academy of Medicine was of long standing he was a Trustee for some years and very active in the Committee on Public Health. He was also Treasurer of the State Society and prominent in the establishment of the New York State Journal of Medicine.

Dr Sondern had a long and interesting career, both in his profession and in organized medicine. He was an earnest and indefatigable worker and his laboratory was a model establishment, known for its accurate and mediculous reports. His acquaintances and friends were many and varied both here and abroad. Almost every year he went to Europe to consult with foreign colleagues on advances in technical procedures, and his high achievements were recognized when the American Society of Clinical Pathologists made him its first president. Organized medicine found in him a capable and conscionatious worker. While in the ranks he wrote and spoke against all forms of socialized medicine, and year after year he developed and headed the antivivisection campaign in the Albany Legislature and did it most successfully.

The profession of this State owes Dr. Sondern a great debt for his labors. In behalf of the Society he was unstinting in the expenditure of time and effort. he was a wise counsellor a tried and trusted friend. Although mactive for a long time, he will be remembered among a large circle of friends and

associates for what he did.

# PROBLEMS ENCOUNTERED IN THE TREATMENT OF CUTANEOUS CANCER

HERBERT L TRAENKLE, M D, Buffalo, New York

(From the Roswell Park Memorial Institute)

ANYONE who treats large numbers of cases of cutaneous cancer soon encounters many therapeutic problems which cannot be solved by the simple application of the particular therapeutic regimen that has been so successful in most of his cases. In such treatment problems, the approach must be individual. The probable result of every therapeutic modality available must be considered, evaluated, and compared

Throughout the literature on cancer therapy, so much attention has been paid to some particular routine treatment scheme that was successful in a large series of cases, so little attention to what has been done with the complicated and problem cases where the scheme could not be used, or where it had been used and had failed True, a large series of simple cases successfully treated with an easily applied treatment scheme is statistically impressive. But this is not very helpful when one is confronted with the problem of treating a case in which the routine cannot be used

To stimulate discussion of this type of case, we are making this brief preliminary report on a few examples from a large group of problem cases in which we are trying to evaluate and compare the efficacy of all available therapeutic modalities

The following cases, recently seen and observed, are discussed to illustrate our present attempts at the solution of therapeutic problems

### Lessons About the Nose

Cutaneous cancer occurring about the nose presented not only more frequent but also more difficult problems than any other category. The cartilaginous structure of the tip and ala of the nose does not tolerate irradiation or electrosurgery so well as the soft tissues. Also, scalpel resection is not so easily done in this area without considerable cosmetic distortion. Because of the position of the nose and its role in determining facial physiognomy, the cosmetic effect of treatment, while of secondary importance, unavoidably demands more consideration than cancer elsewhere

Case 1—J N, a 61-year-old white man, presented a diffuse lupus ery thematosus across the bridge of the nose and both cheeks with much atrophic scarring. On the left side of the bridge of the nose was a nodular ulceration which, upon curetting and biopsy, was found to be a squamous cell carcinoma, grade II Because of the atrophic scarring and the poor condition of the surrounding skin, it was felt that this was not particularly good tissue for irradiation. The lesion, therefore, was treated by very thorough electrocoagulation. When seen, six weeks later, the lesion had healed, and at the present time shows no sign of recurring tumor, but presents a firm, intact, healthy scar.

Case 2 -E D, a 62-year-old white woman, gave a history of having had a lesion on the nose for the past five years It was treated at various times with scalpel and electrosurgery On examination, the lesion consisted of a small ulcer just above the tip of the nose on the upper part of the cartilaginous por-This ulcer measured about 5 mm in diameter and was surrounded by a zone of telanguectases and atrophic scarring, involving a total area of about 1 cm in diameter The lesion appeared as though it might have been irradiated previously, but the patient denied this The curetted material from the soft center of the ulcer showed basal cell carcinoma As this woman was very well preserved, quite good-looking, and appeared much younger than she actually was, we were very anxious to get as good a cosmetic result as possible, in addition to removing her cancer All therapeutic modalities were considered, and the merits and demerits of each were carefully weighed It was felt that electrosurgery would cause too much destruction Because of the peculiar atrophic scarring already present, we decided against She, therefore, was referred to one of our plastic surgeons for excision and reconstructive re-

A V-shaped section of tissue, down to and including the cartilage, was removed, together with part of the nasal septum. The nasal tip was then brought upward and the margins sutured together thoroughly removed the cancer, but, because of the tip of the nose being drawn far upward, the immediate cosmetic result was not so good as might have been desired Therefore, two months later, the area was re-opened and an attempt made to bring the pasal disk down as nearly as possible to a normal position. The pedicle flap from the forehead was then rotated and sutured to the denuded area third operation is now being planned to smooth out the patch-like effect of the pedicle flap Although the patient is likely cancer-free, the immediate cos-

Presented at the 141st Annual Meeting of the Medical Society of the State of New York Buffalo Section on Dermatology and Syphilology, May 8 1947

metic result was rather disappointing to the patient, but was as good as could be expected after such an excision in that area

This case however illustrates that there is frequently a limit to the cosmetoe correction that can be expected with plastic surgery in the cancer patient. The large amount of tassue which must be removed often makes the mechanics of cosmetic correction extremely difficult. The greatest disadvantage of radical destructive surgery on the face is the long term disability the multiplicity of reconstructive operations and the great expense which may be encountered. In such cases, other methods may be more practical from the economic standpoint. This must be remembered in considering cases for reconstructive surgery.

Case 3 - J D C a 75-year-old white man, prosented a basal cell epithehoma on the right side of the nose just above the ala which had been treated twice with radiation during the past three years. Each of the previous treatments had been of rather This recurrence was in the form of small dosage multiple ulcerations in an area about 1 cm. in diameter presenting a rather patchy appearance. Electrocoagulation was considered as a possible thera peutle approach. However in view of the danger of penetrating into the nasal cavity it was decided to use soft radiation in the form of contact therapy with the Phillips tube Accordingly be was given 10 000 r at 50 ky over a period of five days So far the result has been excellent. It is difficult to see box a better result could have been obtained by any other means.

#### Lesions About the Ear

The car is secondary only to the nose as the site for the development of cancer that presents them peutic problems. These problems are due chiefly to the irregular contour of the inside of the concha making radiation mechanically difficult, and, also to the thin layer of the skin and subcutaneous tissue over the cartilage, which poorly tolerates radiation

Case 4.-- VI O a 75-year-old white man when first seen presented an exquisitely tender ulcerated area about 3 cm. long over the rim of the left car This lesion had received x ray therapy at various times during the preceding two years treatment was about six weeks before we saw him. On first inspection, it was difficult to determine whether the entire lesion was a radiation reaction due to previous therapy or whether there was still some epitheliomatous activity remaining. Biopsy was taken, which showed squamous cell carcinoma, Soft contact radiation was considered as a means of treating this lesion, but in view of the previous irradiation he had had, it was felt best to use some other modality Under local anesthesia the whole upper portion of the pinns was removed with the Bovie knife. When seen four weeks later the edges of the cut pinns were healing, and eight weeks following that the lesion was completely healed and has remained so ever since. The ear is cancer-free the cosmetic result surprisingly good.

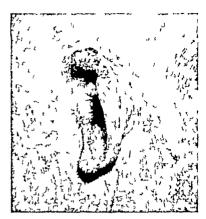

Fig 1 (Case 4) Squamous cell epithelioma of rim of ear

We have noted that removing part of the pinna in older people is not particularly disturbing from the cosmetic standpoint. The ear is not so conspicuous as the nose, and in a casual glance at an individual both ears are not seen at once. Thus, the asymmetry is not readily apparent. In women especially a few tufts of hair make it completely incon spicuous

Fig. 2. (Case 4) After excision of upper portion of pinna.

Case 5 — J C a 71 year-old white man, gave a history of having had a lesion of the left ear for the past eight years, for which he had received no treat ment of any kind On the lower portion of the inside of the conclus of the left ear there was a flat, nodular lesion about 1.2 cm. in length and about 0.5 cm. in width. Ulceration had not yet taken place. Biopsy revealed a grade III squamous cell carcinoma. The lesion was treated by curetting and thorough electrocoagulation. When seen four weeks after treatment, it was noted that the entire coagulated area had sloughed out, leaving a small penetration through the cartilage. However, when seen six weeks later, the entire area had healed, leaving a small perforation with clean edges. Furthermore, the entire area has remained intact ever since.

This lesion was treated with electrocoagulation partly because of the mechanical difficulty of irradiating the uneven contour of the concha, and because of the poor toleration of the cartilage for radiation. The patient is cancer-free and is cosmetically acceptable, because the small perforation is not conspicuous.

However, we have found that in the concha, electrocoagulation is applicable only to small epitheliomas. Larger lesions, especially squamous cell carcinomas of high-grade malignancy, are difficult to eradicate with this method. Such lesions should be excised widely with scalpel surgery.

## Lesions Involving the Scalp

Large epitheliomas of the scalp are usually difficult to treat either by radiation or by electrocoagulation, because of the poor tolerance of the cranial bones for both. We are more and more coming to the belief that surgical excision and plastic repair is the method of choice for scalp lesions of large size.

However, with the idea that soft radiation of feeble penetrability might be a simple way of treating these, in the following case we used socalled "contact" roentgen irradiation

Case 6—F R, a 74-year-old white woman, presented a fungating papillomatous squamous cell carcinoma about 4 cm. in diameter and about 1 cm thick in the midfrontal portion of the scalp. This had been present, untreated, for the past eleven years

Under local anesthesia, the top projecting portion of the mass was removed with the Bovie knife. The base of the lesion was then treated with so-called "contact" roentgen irradiation with the Phillips tube,

6,000 r were given at a single sitting

The treated area required several months to heal, but, eventually, a very fine result was obtained. The greatest disadvantage in this type of treatment was the mechanical difficulty of giving multiple exposures without overlapping in some places and missing small portions of the lesion in others. In some of our cases treated with this method, the results have not been satisfactory

## Lesions Involving Large Areas

Not infrequently, a lesion presents a therapeutic problem simply because of the large amount of surface area involved. Statistical studies correlating size of lesions with cure rate show a definite diminution of the latter when the lesions exceed 3 cm. in diameter. Large areas are sometimes difficult to irradiate uniformly, especially

if the surface is uneven, as, for instance, on the face. Also, large surface areas do not tolerate high dosages of radiation so well as small ones. In using electrocoagulation, much care has to be taken to cover completely the entire lesion with the coagulating tip. Frequently, small bits of the area are missed. We have used surgical excision and repair with split-thickness graft in many of these cases.

Case 7 -E M, a 51-year-old white woman, presented a large peripherally spreading epithelioma involving the left temporal area and forehead. The lesion had been treated repeatedly wih x-ray and electrocoagulation over a period of eleven years. In considering therapy, it was felt that further electrocoagulation, in order to be efficacious, would require extensive destruction with resultant scarring and deformity Further irradiation was, of course, out Therefore, surgical excision was of the question considered as affording the best chance of complete removal of the cancerous area and also the best cosmetic result Accordingly, under sodium-pentothal anesthesia, a large area of skin and scalp over the left forehead and temple region was excised down to and including the galea. Calibrated skin graft of 0 016 inch thick was cut from the left side of the chest with the dermatome This graft was laid over the denuded area and sutured in place

Although, in removing this lesion, a good margin of normal skin was included on all sides, six months after the excision a recurrence appeared along the inferior margin of the graft. This case illustrates the silent extension of the epitheliomatous process beneath normal appearing skin and the need for allowing very wide margins of safety.

## Deep and Penetrating Lesions

Deeply penetrating lesions present therapeutic problems because of the difficulty in determining the limits of the involved area, and in reaching the farther depth of the penetration with the therapeutic modality used The tendency of many basal cell epitheliomas to penetrate deeply and spread out under the normal skin, producing the so-called "silent extension," or "iceberg" type of epithelioma, is not sufficiently appreciated by many therapists We have used the curet in the exploration of many of these, and have been amazed at the extent of undermining produced by an epithelioma which appeared very small at the surface This is especially true of basal cell epitheliomas about the angle of the nose and in the inner canthi The work of Mohs has demonstrated histologically that there is frequently a great difference between the actual extent of the lesion and the visible ulceration, or even the induration felt 1 Therefore, regardless of the modality used in treating these lesions, a wide margin must be allowed. It is felt that such lesions, if not previously irradiated, can usually be handled quite nicely with x-ray, provided the

possible extensions of the lesion are taken into account when mapping out the field to be irradicted. If much depth is suspected or demonstrated, we believe filtered radiation is preferable

Case 8 -E. C., a 63-year-old wlute man gave a history of having had a lemon on his right cheek three years before This was treated by electrocongulation about one year ago but began to recur six months later. He presented a small scarred area about 1 cm in diameter on the right cheek. In the center of this was a nodular process which was just beginning to ulcerate. Upon curetting the soft area was found to extend to a considerable depth into the cheek and laterally in all directions under the normal skip The extension was most pronounced toward the inner canthus. Much epitheliomatous material was curetted out of the opening. The entire undermined area was estimated to be about 20 sq cm.

Fig. 3. (Case 8) Outline indicates limits of area irradiated in 'leeberg' type of basal collepithelioma.

A blopsy of this curetted material showed basal cell epithelioma. The area was mapped out and x ray therapy was administered at 140 kv using 0 25 mm. of copper and 1 mm. of aluminum. A total tissue doss of 4,000 r in a protracted scheme over a period of two weeks was given. The result so far has been excellent.

Occasionally an epithelioma arising in a sebaceous oyst presents a therapeutic problem The following case is illustrative.

Case 9—L. J., a 51 year-old white man when first seen presented a nodular lesion 1.5 cm in dlameter However below this was a freely movable cystic lesion at a considerable depth in the subcutaneous tissue. In deciding on therapy it was thought that both lesions could be removed at once with surgical excision. Accordingly an elliptical incision was made around the area and was carried down through the skin to the subcutaneous tissue. At this time it was noted that the overlying epithelioma extended into the eyst wall beneath. With the aid

of sharp and blunt dissection, the friable cyst wall and overlying skin was exceed

Upon histologic examination of the entire specimen, we were surprised to find that not only the over lying nodular lesion but the entire cyst wall was invaded by basal cell epithelioma, and that the two lesions were connected

One could not be sure that all of the friable tissue had been removed. Therefore, after the incision wound had healed, it was decided to irradiate the area which the cyst had occupied Although it is not ordinarily our policy to combine surgery and irradiation in the treatment of skin cancer, in this case because of the peculiar structure of the lesson and the question as to whether or not it was completely removed, we felt justified in so doing Furthermore the area of irradiation was mapped out by one who had seen the operation and who know exactly where the cyst had been. Irradiation given consisted of a total of 6,000 r with a tumor depth dose of 3 180 r given at 200 kv with 0 5 mm. of copper over a period of twenty-one days. The result so far has been good.

#### Problems Due Mainly to Previous Treatment

Not the least frequent among the problems en countered in the treatment of cutaneous cancer are those due to previous attempts at treatment. This is especially so in lesions which had been irradiated previously. The previous radiation therapy was usually that of insufficient and unfortunately frequently repeated dosage.

Case 10—R. L. a 69-year-old white woman, when first seen presented an atrophic searred area on the right check adjacent to the nose and pointing toward the inner canthus. There were some crusts under which soft tissue was found upon curetting. Biopsy of this material showed it to be a basesquamous epithelioms. The history here was one of repeated treatment for the past sixteen years. For the most part this had consisted of insufficient desage of radium and x ray with occasional electrocoagulation of a new recurrence. This palliative and patchwork type of therapy had through the

Fig 4. (Case 10) Basesquamous epithelioma in old scarred area pointing toward right inner canthus.

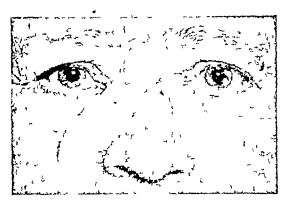

Fig 5 (Case 10) Five months after excision of the epithelioma and plastic repair with forehead flap

years, produced an ever-enlargening quilt of scar tissue and carenoma. If continued, this type of therapy would have ultimately caused the destruction of the right inner canthus and of the side of the nose

Ordinarily, an epithelioma in this location would not be much of a problem. But, in view of the previous ineffectual treatment over a long period of years with resultant scarring and destruction of the normal tissue in this whole area, further irradiation was thought inadvisable. Likewise, electrosurgery, to be complete, would have required complete destruction of a very wide area. This would have been slow to heal and possibly would have resulted in the formation of a chronic ulcer. Therefore, scalpel surgery with plastic repair was regarded as the modality of choice.

Under local anesthesia, the entire area was widely excised from the inner canthus up toward the side of the nose and down below the malar prominence, and in depth down to and including the periosteum A pedicle flap from the forehead was rotated and sutured to the denuded area. Five weeks later, the bulge formed by the rotation of the pedicle was excised

The lesson, so far, is cancer-free, and the cosmetic result is better than could have been obtained with any other method

Case 11—W D, a white man, 60 years old, gave a history of having had seven or more x-ray treatments over a period of about four months to a lesion on the left cheek. The exact amount of radiation which he had received was impossible to determine Examination of the lesion revealed a superficial ulcer about 2 cm in diameter with soft, undermined edges. There was no induration, nodules, or rolled borders

On the first visit, it was difficult to say whether this lesson was due to radiation necrosis, to cancer, or to both However, histologic study of curettings taken from the entire floor of the lesion showed basal cell epithelioma

In deciding on therapy for this lesion, it was felt that further irradiation would not be suitable in view of the indefinite amount he already had had. The other alternatives were scalpel surgery with excision and full thickness graft, or thorough electrocoagulation. Chiefly because of simplicity, the latter was

chosen So far, the patient is cancer-free and the result has been cosmetically good

## The Problem of the Hopeless Case

Although usually not discussed, we believe the problem of the hopeless case is worthy of mention. It must be admitted as a fact that we do see advanced cancer of the skin which we know cannot be cured. Once that is so decided in a given case, the further problem arises as to what should be done with the patient. Unfortunately, in many such cases, attempt at therapy frequently results in making the patient's plight much worse. The following is a case of point.

Case 12—N F, a 71-year-old white man, gave a history of having had ulceration which began on the right temple twenty-two years ago This lesion has slowly but continuously progressed ever since No therapy of any kind had been given

He presented an ulcerative destruction of almost the entire right side of the face, including the right eye and the frontal sinus. There appeared to be an extensive invasion of the bony structures almost to the meninges. The right orbit, for the most part, was destroyed. There was another lesion on the left cheek, cystic in character with very little ulceration Biopsy of both these lesions revealed basal cell epithelioma.

We believed that the lesion involved the bony structures to such a depth that radiation would produce extensive necrosis of the bone and probably a resultant meningitis Electrocoagulation was considered out of the question Likewise, we felt that the lesson could not be completely removed by scalpel excision without penetration into the meninges In other words, it was agreed that this lesion could not Further, it was felt that any attempt to do so would either kill the patient or convert most of his face into a large sloughing excavation tionably, he would be made more unsightly than he already was and be subjected to considerable physical suffering Strangely enough, he had very little discomfort at the time Briefly, anything that we would have done to this patient would have made him worse Therefore, the treatment of choice here was no treatment.

#### Summary

A conclusive evaluation and comparison of treatment methods as they apply to specific problems in cutaneous cancer cannot be made in this brief preliminary presentation. However, it is hoped that such observation on numerous cases over an extended period of time will permit more valid conclusions as to the preferable choice of therapeutic modality in a case that is more complicated than the average, and in which a simple routine type of treatment cannot be applied

### Discussion

Dr George C Andrews, New York City -- Many skin cancers can be cured by any one of several methods of treatment. There are others which specifically need treatment by one and no other method for instance, epitheliomas of the nose which usually call for x ray therapy and the epitheliomas of the rim of the ear which require surgical removal

There is another group the intricate cases, the difficult ones. In this each case presents an individ ual problem. That is the reason that discussion of

this group is not often undertaken

Whenever wide surgical excision is feasible that is Unfortunately, this is not always the best method Perhaps 50 per cent of the epitheliomas are favorable for excision The other 50 per cent are better treated by roentgen irraduation electrocoagulation, or some other form of therapy group includes most of the lesions on the nose and eyelids and those occurring in aged and infirm per sons. It also includes very extensive ulcerations which are too large for excision.

As stated by Dr Traenkle, contact x ray therapy has special advantages for epithelioma of the lids. Two most important considerations are the distribution of the radiation insuring adequate field coverage and adequate depth dose and second the

fractionation of the dose

Dr Traenkle mentioned the important work of Mohs. Everyone should see his models of the burrowings and "silent extensions" of the epitheliomas that he has studied. These illustrate that a small lump on the skin may silently and invisibly extend in various directions like an octopus or tinkertoy

Repeated recurrences after surgical excisions are undoubtedly often due to failure to recognize this clinical fact. Surgical success depends upon the removal of overy malignant cell The surgeon therefore must excise a wide margin of apparently normal tissue to be safe. "Success with radiotherapy depends upon the radiation effecting every cell in the tumor that is liable to divide it must either cause their death or render them incapable of further proliferation \* The results of radiotherapy in cutaneous cancers are often better than those of surgery

#### MANY MATERNAL DEATHS DUE TO HEMORRHAGE ARE PREVENTABLE

"Hemorrhage today outranks all other single causes of maternal death in the United States,' writes John Totterdale Cole M.D. in the September 20 issue of the Journal of the American Medical Association And yet he reports since the method of blood replacement now used at the Woman's Clinic of the New York Hospital has been adopted there has not been a single death from hemorrhage during 7 500 gynecologic operations. On the ob-stetric service only one death from this cause has

occurred during 14,000 deliveries.

In his article Dr Cole, who is a member of the Department of Obstetries and Gynecology at Cornell Department of Obstetries University Medical College and at the New York Hospital, points out the general need for procedures similar to those used by his hospital in combating that dreaded complication of pregnancy great loss of blood. The hasis of successful therapy he writes, ' is the rapid restoration of blood volume by the intravenous use of blood or plasma, preferably the former Dr Cole believes that fewer American women would die if the importance of the time factor were more generally appreciated. When blood transfusion is delayed abnormally low blood pressure can quickly progress to impending shock, impending shock to irreversible shock.

Among the practices of the Woman & Clinic of the New York Hospital which he emphasizes are Determination of the blood group and the Rh

type of all patients at their first "before delivery" Cross matching of the blood of all patients before delivery if it appears that a large loss of blood may One or more pints of blood will then be held on call for immediate use, at the central blood bankor, in case of occarean section in the operating room iteelf

Measuring the patient s loss of blood as it occurs so that it will not be underestimated.

When hemorrhage has occurred, shortening the duration of anesthesia by avoiding surgical procedures which can be postponed.

Keeping a small obstetric blood bank for emer gencies on the delivery floor itself in addition to the large, active general blood bank. The blood in the small bank should be of a type which may be used for any patient without preliminary typing or cross matching.

When an exceedingly large volume of blood has been lost rapid replacement by a simple pressure mechanism added to the ordinary transfusion appar atus. In such cases the drip method of transfusion is too slow

The administration of alkali agents to combat transfusion reactions and to delay the onset of irre-versible shock until enough blood and plasma are available.

Since the method was adopted, Dr Cole concludes ' there have been no deaths from hemorrhage during 3 600 major and 3,900 minor gynecologic operations. On the obstetric service one death due to hemorrhage has occurred during 14,000 deliveries. While the method has been in use there have been 250 postpartum hemorrhages.

# FIFTEEN YEARS OF ELECTROCARDIOGRAPHIC EXERCISE TEST IN CORONARY STENOSIS

DAVID SCHERF, M D, New York City

(From the Department of Medicine, New York Medical College)

OR many years spirited discussions were Theld concerning the mechanism responsible for anginal pain A great number of hypotheses were created and many phantastic ideas were defended Not rarely the abnormal condition leading to the pain was placed outside of the heart, in the autonomic nervous system, for ex-About fifteen years ago, the explanation that anginal pain is due to cardiac ischemia became generally accepted This conception is old and found support soon after the appearance of Heberden's classic report Voices were often raised against this explanation, but they were silenced when it was shown that during an attack of anginal pain, not caused by coronary occlusion, rather marked transient alterations appeared in the electrocardiogram 1 These alterations proved the existence of a temporary myocardial damage

The registration of the electrocardiogram during an attack of anginal pain, however, was restricted to patients with decubital angina was proposed, therefore, not to wait for that rare opportunity of obtaining an electrocardiogram during an attack of pain at rest, but to provoke an attack by physical exertion in order to diagnose coronary stenosis 2-6 In 1931 a report was published describing the electrocardiographic changes which appear during an attack of angina pectoris caused by exercise • The authors found marked changes in the electrocardiogram after exercise. but decided against the use of this method of examination for diagnostic purposes because, in their opinion, clinical findings are more significant than the electrocardiographic changes contradiction to this opinion the electrocardiographic exercise test was recommended for diagnostic purposes because the diagnosis of angina pectoris by clinical examination is for various reasons impossible 4,7 One must rely on the history which is often biased A method which enables the physician to diagnose the presence of coronary stenosis objectively should be welcome It is worthy of emphasis that the exercise test does not make it possible to confirm the presence of anginal pain, it merely enables us to diagnose the existence of a syphilitic or an arteriosclerotic coronary stenosis which forms the pathologic hasis for angina on effort in most cases

The test is based on the following simple principle Patients who have a coronary stenosis

have no pain and may show a normal electrocardiogram at rest because the blood supply to the myocardium is adequate. If greater demands are placed on the heart muscle by a faster rate, increased motility, higher blood pressure, and stenosis of a branch, or an orifice of a coronary artery prevents sufficient increase of blood supply to meet these augmented demands, relative ischemia of the heart muscle leads to electrocardiographic changes. Pain may or may not appear

The technic of the exercise test and its results were often discussed in articles and monographs. Therefore, only selected points and controversial questions will be discussed here.

1 The changes in the normal electrocardiogram following moderate exercise, like climbing stairs, were for the most part known to Einthoven They may be summarized as follows

The P waves become larger

The Ta wave becomes more pronounced and since it is negative with positive P waves and is of long duration, it may cause a depression of the RS-T segment below the zero line.

The QRS complex may show slight changes indicating a shift of the electric axis to the right. Thus, the R wave becomes smaller and the S wave sometimes deeper in lead I, these changes are due to the diaphragm which following physical effort assumes a

position similar to that in inspiration

The RS-T segment may become depressed below the zero line, at the same time the RS-T junction (J) is also depressed. This is partly due to the sinus tachycardia and a higher sympathetic tone. In view of the Ta wave the reference level for measuring the position of the RS-T segment is the level of the beginning of the QRS complex (the end of the P-Q segment). The downward displacement of the RS-T segment after exercise in the normal standardized electrocardiogram should not amount to more than 1.5 mm.

The T waves usually become higher and more peaked, but in some normal cases they become lower in leads I and II This fact is often overlooked and the unjustified diagnosis of an abnormal (positive) exercise test is based on it. This lowering of the T waves is particularly common in those healthy subjects who show the postexertional changes of the QRS complex in lead I which were discussed above.

The U waves are often more pronounced after

exertion.

Even after exhaustive exercise (marathon run) nothing more than the above changes are found. Unusually strenuous exercise may produce more

marked changes.\* On the basis of existing data it can be said that as yet there is no proof that pathogic changes characteristic for coronary stenosis, appear after exercise even in patients whose hearts are abnormal, provided the coronary blood supply is adequate.

2 The pathologic changes consist in a disappearance or inversion of the T waves in lead I and II and/or a depression of the RS-T segment which is more marked than that appearing normally A high take-off occasionally is observed for a few minutes after the exercise \*\*

Low take-off is much more common

Fig. 1 Positive exercise test in a patient with coronary sclerosis.

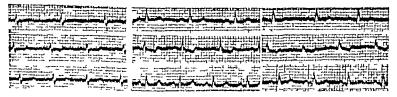

The upper row of tracings in Fig 1 shows the three standard leads of a 63-year-old man with an angina on effort caused by coronary sclerosis. There is a slight depression of the RS-T segments in leads I and II and the T wave in lead I is about mally low. After climbing two flights of stairs the electrocardiogram shows a sinus tachycardia (second row) with an abnormal depression of the RS-T segment, surpassing 1.5 mm. At the same time pain of the anginal type occurred. Five minutes later the electrocardiogram underwent even further changes (third row) and deep inverted T waves are visible in leads I and II. In the meantime the pain had subsided.

Another positive test in the standard leads is shown in Fig. 2. Here the electrocardiogram in the top row taken at rest shows only a low T wave in lead I and some slurring of the QRS complexes. Atter exercise, marked changes appear with inversion of the T waves in each lead Two minutes later (third row) the electrocardiogram shows nor mal positive T waves in all three leads.

Fig. 3 was obtained from a woman with syphilitic sortitis and angina on affort At rest, the electrocardibgram showed left axis deviation (first row) with a slight depression of the RS-T segment which is most marked in lead II it is within normal limits. After climbing one flight of stairs the tracings in the second row were taken An inversion of the T waves appeared in lead I and a greater depression of the RS-T segment occurred in leads II and III The T waves in the latter two leads are higher The patient felt a pain of moderate severity behind the sternum. Two minutes later when the electrocardiograms in the third row were registered, this pain was very severe. The electrocardiogram showed the same changes. Five minutes after the exercise the pain was still very severe but the electrocardiographic changes began to disappear (fourth They were still present fifteen minutes after the exercise when the pain had completely subsided at this time (fifth row) the T waves are inverted in lead II. The sixth series recorded twenty five minutes after exercise, showed not only the reappearance of positive T waves but the T waves were even more positive than prior to the exercise and during rest.

Occasionally electrocardiographic changes appear after an exercise test before the pain appears. Fig. 4 was obtained from a 45-year-old patient with cor onary schoosis. The electrocardiogram at rest (Fig. 4a) is normal. Immediately after running down one flight of stairs three times Fig 4b was taken. It shows a sinus tachycardia with a depression of the RS-T segment in lead I and in CR as well as CR. The patient was diszy but did not have any pain. Five minutes later when Fig. 4c was taken the patient felt some pain at this time the alterations in lead I and in CR, are more pronounced while they are already receding in CR1 utes after exercise, when Fig 4d was obtained, the changes persist in lead I there is an inverted T in CR, but CR, shows a normal RS-T and a positive T wave.

3 These tracings show a few facts which are often overlooked in performing the exercise test. In some patients the abnormal electrocardiographic changes appear early and disappear within two to three minutes therefore they are not present when the first electrocardiogram after the exercise is taken after the lapse of some time

F10 2. Positive exercise test in a patient with syphlitic sortitis.

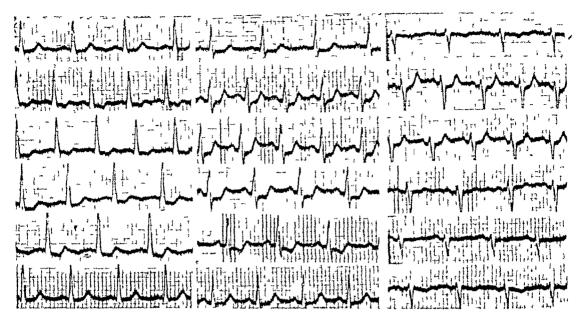

Fig. 3 Positive exercise test in a patient with aortitis

(Case 2) In other instances the changes appear late and in some of our cases they happened as late as ten minutes after the exercise <sup>10</sup> In the first few minutes after the exercise only higher, positive T waves may appear, that is, the same change as is seen in the healthy. Therefore, in order to be sure that one does not miss pathologic changes, the electrocardiogram should be taken before, immediately after the exercise, and two, five, and ten minutes after the exercise

The registration of the chest leads, particularly in position 5, is important because marked changes may appear in this lead and be absent in the standard leads

It is an important rule not to ask the patient to perform the exercise until pain is felt This procedure has been recommended recently but it is dangerous and unjustified In some cases even with the most marked pain electrocardiographic changes are slight or vice versa After exercise marked changes often appear at a time no pain appeared as yet, or when the pain had subsided spontaneously or with the aid of nitroglycerine Therefore the statement that electrocardiographic changes should not be expected if no pain appears is untrue It is equally inadvisable to standardize the electrocardiographic exercise test in such a way that patients evert themselves according to their sev, age, and The condition of the patient's heart alone determines the amount of exercise required A thin frail young woman with a syphilitic stenosis of both coronary orifices may develop alarming changes in the electrocardiogram after walking fast for only a few steps, an obese old man with hypertension may show pathologic and significant changes only when he climbs six flights of stairs after a heavy meal. Here, as elsewhere in cardiology, standardization often represents precisely the method of procedure which should be avoided. The degree of pain produced is not a measure of the electrocardiographic changes which may occur nor of the degree of my ocardial ischemia.

In order to avoid accidents which may be attributed to exertion by the patient, it is well to permit evercise only after a careful examination and electrocardiogram indicating that there is no

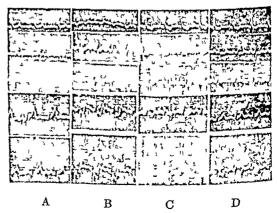

Fig 4 Positive evercise test in a patient with coronary sclerosis in this figure the five lends are beneath each other

contraindication against physical effort. Increased exertion should be undertaken by the patient only if the electrocardiogram after a less exercise does not show far advanced changes. If this precaution is taken the risks involved in the exercise test are negligible. The amount of exercise in the first test should not surpass the amount of exertion which every patient performs during his daily routine.

From the pattern of the electrocardiographic changes in a positive exercise test certain conclusions are possible as to the mechanism of their development. The usual changes are a depression of the junction J and of the RS-T seg ment with lowering or inversion of the T waves in leads I and II as well as in the apical chest leads over the left ventricle These changes are generally seen in patients with a damage of the subendocardial layers of the myocardium Simi lar changes appear during the administration of digitalis. The subendocardial layers of the myocardium are more sensitive than other parts of the myocardium to a diminished blood supply They are first severely damaged in chronic and acute anemia, in carbon monoxide intoxica tion and following the administration of large doses of digitalis. Due to this damage the du ration of the depolarization in these fibers becomes shortened it does not outlast the stage of depolarization of the subepicardial layers of the myocardium 11 This is known to lead to a depression of RS-T and T in leads I and H situation is reversed in the normal heart where the inner layers of the myocardium become depolarized early and are repolarized late

One of the more important arguments support ing this explanation is the after-effect in the electrocardiogram following a positive exercise test In cases in which marked changes (deep depression of the RS-T and T below the base line) are seen after the exercise very high positive T waves appear a few minutes after the depression of RS-T and T subsides In some cases these positive T waves are seen as early as ten minutes in others as late as fifty minutes after the exer-The T waves may become higher than they were before the exercise was done in patients who had inverted T waves before the exercise they may become temporarily positive after the pathologic changes subside (Figs. 2 and 3) There are reasons for assuming that damage of the inner layers of the myocardium causes depression of the RS-T segment and the T wave as an acute effect and high positive T waves as an after effect. In patients with damage of the subepi cardial (outer) layers of the myocardium, as in pencarditis an elevation of the RS-T segment and the T wave appears in the acute stage while an inversion of the T waves occurs later in the stage of repair. In rare cases of stenosis of a coronary vessel supplying blood to the subspicardial layer of the myocardium a temporary high take-off resembling that of acute myocardial infarction is seen after exercise 7.1 In one observation such a high take-off was observed regularly on exertion. The autopsy demonstrated normal coronary arteries but stenosis of the orifice of one artery.

Whether the changes are simply due to anovin or are the consequence of some damage caused by the ischemia is not certain but the latter is more probable. It has been shown by perfusion experiments that if the heart is per fused with solutions which are poor in oxygen or abnormally rich in carbon dioxide the described changes do not appear 12 Metabolic disturbances as the consequence of anoxia are most probably responsible This explanation is also favored by the experience that the pathologic changes in the electrocardiogram after the exercase test may persist for longer than forty min utes, when pain tachy cardin, and dyspnea have long disappeared 47

The lack of parallelism between pain and the alterations in the electrocardiogram is more readily comprehended if one considers that the pain is due to the accumulation of abnormal metabolites in the interstitual tissues while the electrocardiographic changes are due to an abnormal status of the myocardial fibers themselves

- The question whether the exercise test or the anoxemia test is preferable has often been discussed Both are of value The anoxemia test requires an additional apparatus and has some other disadvantages. While the exercise test has been found abnormal (positive) only in cases of coronary stenosis provided the exercise was not of unusual intensity the anovemia test has been found abnormal in patients with rheu matic fever in anemia and in endocrine disorders 12 The risks are greater since cerebral accidents and pulmonary edema do occur The border between the changes which occur in the normal and those which are found under pathologic conditions is less sharp doubtful cases of coronary diseases in which the diagnosis is difficult, the exercise test is more often positive than the anoxemia test 13
- 8 The effect of premedication on the exercise test has often been investigated <sup>4 in</sup> and it has been shown that papaverine aminophyllin and introgly cerine particularly the latter, when given shortly before the exercise test may convert an otherwise positive exercise test into a negative one. Changes are less conspicuous or even absent. In some cases the administration of

vasodilators will not change the outcome of the test and the conclusion will be justified in such an instance that compensatory dilatation of collateral vessels does not suffice to improve the myocardial blood supply

## Summary

The exertional changes in the electrocardiogram of the healthy and those which appear after exercise in patients with coronary stenosis are described

Typical electrocardiograms are demonstrated It is shown that marked changes may appear before the pain is felt or after it has subsided

Reasons which speak against standardization of the exercise test are given

The effect of medication on the result of the exercise test is described

## MANY PATIENTS HAVE EMOTIONAL ILLNESS COMPLICATING PHYSICAL DISEASE

At least one half of all patients have their symptoms as a result of emotional difficulties in addition to and as a part of the physical disease, according to Raymond W Waggoner, M D, of Ann Arbor, Mich

"Every patient will respond more promptly to treatment of any disease if the physician understands and adequately handles the emotional as well as the physical aspect of the illness therefore it is essential that every physician, whether he is in general practice or in a specialty, obtain some understanding of psychiatric principles and utilize these principles in the treatment of all of his patients," states the author

Writing in the June 28 issue of the Journal of the American Medical Association, Dr Waggoner, professor of psychiatry at the University of Michigan, points out that only about two per cent of the registered physicians in this country are trained in psy-chiatric procedures, therefore the task of treating emotional illness falls upon the general practitioner

"Recognition of the importance of emotional factors in illness, a willingness to spend more time with such patients, an understanding of some of the motivating factors in such conditions, and the ability to help in the solution of such problems are essential characteristics of every good physician," states the author

The physician cautions that since patients tend to exaggerate symptoms of physical illness, great harm can be done by the prescription of unneeded rest

## MATERNITY IN NEW YORK CITY NOW SAFEST IN HISTORY

Never in history has maternity been safer than the present day, it was revealed recently by the Maternity Center Association. The Association emphasized that the United States, which once suffered a maternal death rate among the highest of any civilized country in the world, now is known to be the safest, with New York City in advance of all other sections of the nation

As recently as 1933, it was shown, the maternal death rate in New York City was 5 maternal deaths in every 1,000 live births, a figure that had been stable for more than a decade. It was then believed that the rate could be lowered to an "irreducible minimum" of 2 per 1,000. This figure was justified as "irreducible" in view of the fact that abnormalities and complications other than maternal causes must be considered

But so successfully has progress been made that in 1946 the maternal death rate in New York City had been reduced to 1 08 per every 1,000 births

Good hospital maternity service has contributed

much to the current maternity record During the past few years in a local hospital caring for more than 20,000 mothers, including many with abnormalities and complications, there was only one death from toxemia and 6 infection deaths In maternity services where only normal mothers are cared for, deaths from both toxemia and infection over a period of years have almost reached the vanishing point

The importance of hospital maternity care is further seen in the fact that today approximately 98 5 per cent of all babies born in New York City are delivered in the hospitals

The efforts of both professional and lay organiza-tions—such as the Maternity Center Association, the New York Academy of Medicine and other health and welfare agencies—in placing continued emphasis on health education and information, and in raising medical, hospital and nursing standards to higher levels, also have been a primary factor in reducing maternal mortality

#### CUTANEOUS ULCERATION IN ORGANIC CENTRAL NERVOUS DISEASE

Report of Trophic Ulcers in a Case of Postmeningitic Myelitis and in a Case of Dermoid Cyst of the Spinal Cord

DAVID BLOOM M.D. New York City

(From the New York Skin and Cancer Unit of the New York Post-Graduate Medical School and Hospital)

THE connection between cutaneous disturb-Lances and disease or injury of the nervous system forms too yast a subject to be dealt with This paper, therefore, is limited in one article to the discussion of cutaneous ulcerations observed in the course of ormnic disease of the central nervous system, in connection with the report of two cases The choice of this topic was stimulated by the thought that such lesions are rarely seen by the dermatologist, and better knowledge of them might help to diagnose earlier some cases of nervous system disease

Another thought was the desire to stimulate interest in the subject of the relation of the skin to the nervous system in general The close connection between these two systems, in utero and postpartum, and the not infrequent observation of skin changes in peripheral and central nervous disorders, justifies thorough study of this relation between the skin and nervous systems sults of such investigations might throw light on the etiology and pathogenesis of some skin diseases which, so far, are obscure in regard to causation, and in which nervous evatem disturbance might possibly be an underlying factor

#### Trophic Innervation

Cutaneous disturbances seen in association with disease of the nervous system are known under the term "trophic The problem of the existence of special trophic innervation has been discussed for many decades Although the existence of such nerves has not been proved, many clinicians use the term trophic nerves. scrutinizing the literature on this subject one finds that most of the authors are inclined to consider the trophic function of the nervous system as a combination of the function of sensory and vasomotor nerves leaving the fact uncertain whether there exist, in addition, truly trophic fibers and centers.

Trophic ulcers are accepted generally to be the result of degenerative changes in these nerves, leading to impairment or cessation of their function, in addition to trauma to the affected akin area, which is an important precipitating factor

It is logical to assume that analgesia plays an

important role in the development of these ulcers The inability to notice any injury deprives the skin of its most important protection which is given it by sensation of pain But this sensibility disturbance alone is not sufficient to explain the marked vulnerability of the affected skin areas and the readiness to form an ulcer even following a This fact and the poor tendency of mild insurv trophic ulcors to heal, has unavoidably led to assumption of special trophic impulses by specific trophic innervation 1

#### Trophic Ulcers

The different kinds of trophic ulcers seen in association with disease or miury of the central nervous system have essentially the same pathocenesis Their different clinical features are determined mainly by difference in location of the cutaneous lesion and somewhat, by the kind of underlying nervous system disease.

#### Malum Perforans

The oldest and best known trophic ulcer is the so-called malum perforans which is mostly seen in tabes domain-the prototype of disease of the posterior tract of the spinal cord

It is usually located on the sole of the foot under the first or fifth metatarsophalangeal joint, but may be seen on other pressure areas of the plantar surface, such as under the terminal phalanx of the big too or under the heel More rarely it is located on the tip of the toes and on the external aspect of the foot. It may be unilateral or bilat-Because of absence of the defense mechanism afforded by pain sensibility, a degree of friction and pressure is permitted which results in a callus, formation of a bursa, suppuration by infection, and destruction of the underlying tissues including bone. The ulcer is funnel shaped narrower on the surface than in depth, is surrounded by a hyperkeratotic border, and shows granulation at the base. The characteristic features of malum perforans are the hyper keratotic border, the noninflammatory appear ance, the insensibility to pain, and its persist-

Although this ulcer of the foot is most com monly seen in tabes dorsalis it has been observed also in other spinal cord lesions such as in lumbosacral syringomyella,2 in fracture of the verte-

Presented at the 141st Annual Meeting of the Medical Bociety of the State of New York, Buffalo Section on Dermatology and Syphilology Thursday May 8, 1947

brae causing hemorrhage into the cord<sup>3</sup> or compression of the cord,<sup>4</sup> and in vertebral tumor <sup>5</sup> In syringomyelia, in which the cei vical part of the cord is mostly involved, lesions are seen more often on the fingers, in contrast to tabes dorsalis in which the trophic ulcei commonly is seen on the foot. Among 91 collected cases of perforating ulcer of the foot, Gascuel found 61 which had central nerve lesions <sup>6</sup> Of these, 32 had tabes 17, general paresis, 4, traumatic disease of the cord, 8, various cord lesions, and 1 had Friedreich's ataxia

There is no doubt that in malum perforans of the foot the mechanical factor of pressure is of particular importance in determining the appearance and the course of the lesion

Although this trophic lesion in tabes is well known, the trophic ulcers of tabes located in other areas are less known, due to their relative infrequency, but also to their lack of particular characteristic features Their different clinical appearance is determined mainly by their differ-They may be located on the dorent location sum of the foot, the mesial aspect of the knee, and on the face This latter location has been reported in a number of cases, particularly by French authors, who term these lesions, buccal, nasal, and auricular mal perforant. Darier reported a case of such a trophic ulcer on the tongue and one on the nasal septum in cases of tabes 7 Others (Pierre Marie and Guillain,8 Giraudeau,9 and Jacques<sup>10</sup>) have reported such lesions on the nostrils and the ears Giraudeau described the buccal ulcer as round or irregular, sharply limited with no redness or infiltration in the borders The base is smooth and vivid red The area of the ulcer is analgesic but the tactile sense is pre-In buccal ulcers, the teeth loosen and fall out, the alveolar edge of the jaw is absorbed, and if the upper jaw is affected perforation into the antium takes place. Frey reported such a case of a trophic ulcer of the left nostril associated with painful falling out of teeth as a first symptom of tabes 11

The trophic ulcers on the nostrils in tabes do not seem to differ from those seen in encephalitis Such cases have been reported by Lammersmann, 12 Petzal, 13 and Schlittler 14 in Europe, and by Greenbaum and Alpers,15 and Rosenberg and Solovay,16 in the United States In these cases the history and course are surprisingly identical Several or many years after the appearance of Parkinson's syndrome, the patient develops pruritus on one of the wings of the nose, which he scratches continuously and produces a progressively enlarging ulcer, which leads to destruction of the nostril and adjacent parts of the cheek and lip Also in these lesions the teeth loosen and fall out Although trophic gangrenous ulcers in encephalitis lethargica have been described as located in other areas, such as on the hands (Büchler, 17 Adler, 18) and on the leg (Wielig and Biernig, 19) most reports deal with the loca tion on the nostril Why this particular location is favored for the trophic ulcer in Parkinson's disease is difficult to explain. According to Rosenberg and Solovay, 16 seborrhere dermatitis, which is so frequent in encephalitis lethargica, may have some influence on the development of these ulcers The statement made by Purves-Stewart<sup>20</sup> that complete section of a cutaneous nerve may lead to cutaneous pruntus in the skin surrounding the anesthetic area, leading to chronic scratching and ulceration, may be of interest in this connection, for in most of these reports the identical history of pruritus and continuous scratching is obtained

The importance of trauma as an exciting factor in the production of these ulcers is obvious. Primarily, however, these ulcers are to be considered as a late complication of encephalitis lethargica, although on an objective sensory examination only some decreased pain sensation or diminished tactile sensation is detected in the area of the ulceration. A case of a similar trophic ulcer on the left ala nasi, following a head injury, was presented by Costello at the Atlantic Dermatological Conference in 1940.

#### Decubitus

Decubitus is another clinical form of troplic ulcer which is distinguished by particular location and by the fact that it is found mostly in patients laid up in bed for a long time with a serious disease, most often of the central nervous system This type of ulceration has been known also for many decades, Samuel being the first author to describe it in 1860 22 The acute type is seen most frequently and typically in cases of hemiplegia due to cerebral hemorrhage, in which it is located in the gluteal region, on the side opposite to that of the cerebral lesion In spinal cord lesions it is situated in the middle, over the sacrum, and in myelitis with the Brown-Sequard syndrome, on the great trochanter, on the anesthetic side Less characteristic locations are the heel, the ankle, the scapula, and the knee The lesson starts with an erythematous spot which forms into a bulla, then into a black crust, and finally into an ulcer which rarely heals, but more often leads to general infection or pulmonary septic embolus and death It may reach by deep extension the sacrococcygeal canal and infect the meninges by extension upwards Because of the serious prognosis of cases afflicted with acute decubitus, Charcot termed it "ominosus" cubitus rarely is seen in poliomyelitis observed it over the sacrum or the heel in cases of lateral cordotomic for pain due to vertebral cancer <sup>23</sup> Charcot and Kaposi have seen acute decubitus mostly following brain abscess <sup>24</sup>

Although the mechanical factor of pressure and contamination of the skin with urine and feeal matter plays an important role in the production and peristence of the decubital ulcer in the chronic form the trophic disturbance of the skin is, particularly in the neute decubitus, of primary importance. This explains the rapid development of decubitus in scrious diseases of the central nervous system within a few hours or days, in contrast to the cuses of cardiac disease, nephritis and cancer in which eschardue to infection develops after weeks or mouths of confinement to bed

The precipitating external factor of pressure in decubitus does not differ essentially from that in malum performs. The explanation for the climical difference in these two forms of trophic ulcers may lie in the fact that the underlying nervous system disease in decubitus usually is more severo than in malum performs. Decubitus is most typically seen in hemiplegia hemorrhage into the spinal cord, abscesses or acute softening, spinal

cord mjury, etc 35

While malum perforans nasal lesions in tabes and particularly in encephalitis lethargica and decubitus form special types of trophic ulcers with characteristic clinical features, other trophic ulcers have no special peculiarities in regard to location or appearance. Here belong ulcers observed in spinal cord tumors, mychitis, syringomyella, and Friedreich's disease. According to Elsberg trophic ulcers are rare in cervical and thoracic cord tumors, but not infrequent in lumbosaeral and cauda equina growths.

My report of 2 cases, observed at the Skin and Cancer Unit on the service of Dr I Rosen deals with trophic ulcers of the latter type One deals with a gangrenous ulcer in a tumor of the lower spinal cord and the other case with trophic ulcers in myelitis following meningitis

### Report of Cases

Case 1—J S a man aged 48 born in Germany a milk platform man by occupation, had registered at the Skin and Cancer Unit on December 20 1040 He complained of an ulceration of the left heel of one week duration and of a similar lesion on the left but took which had been present for eight months.

On examination the posterior aspect of the left heel presented a gangrenous ulcer measuring about 2 by 4 inches in diameter and involving mostly the external and inferior aspect of the back of the heel (Fig. 1). The borders were well marked and surrounded by a zone of crythema. The peripheral area of the ulcer was covered with granulation tissue which contained small black necrotic spots. The middle and lower portion of the ulcer which was considerably depressed formed a mass of black

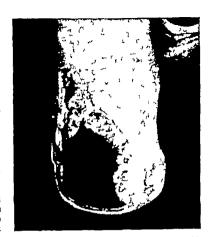

Fig 1 (Case 1) Gangronous ulcer of one week's duration on left heel.

necrotic tissue The patient stated that for the past several years previous to the development of the ulcer this area of the heel was fasured and hyper keratotic The ulcer which had started a week previously to the visit at the clinic had been enlarg ing gradually

On the lower part of the left buttock there was a superficial ulceration oval in shape of 11/2 by 1 inch in dameter well-defined, and surrounded by an crythematous zone (Fig. 2) The ulcer started in April 1940 and became worse in May 1940 but had shown a tendency to heal since then

The patient complained of pain at night in the area of ulcoration. His past history was irrelevant except for constipation which at times was so severe that he did not move the bowels for a period of three days.

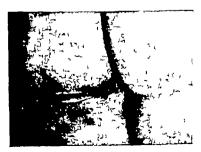

Fig. 2. (Case 1) Trophic ulcer of eight months duration.

Because of negative laboratory findings, including urine, Wassermann and Kahn reaction of the blood, blood chemistry and count, and because of exclusion of arteriosclerosis in the patient, a possible neurologic condition was assumed and the patient was referred to the Neurological Department of the Post-Graduate Hospital He was admitted to the service of Dr George Blakeslee, on December 31, 1940

The following neurologic status was noted. The cranial nerves were essentially normal. The deep reflexes of the upper extremities were active and equal. The left patellar reflex was more active than the right, and the Achilles reflex on the right was absent while on the left it could not be tested. The abdominal reflexes were active and equal. There were some myocolonic movements in the left gluteal muscles. The plantar reflexes were mildly active. No Babinsky reactionnor confirmatories, no Hoffman reaction now clonus could be obtained.

Coordination examined by the finger to nose and heel to knee tests were normal. Sensory examination revealed, anteriorly on the left, an area of hyperesthesia extending from the level of the umbilicus down to the middle of the left thigh, and, posteriorly, a saddle area of anesthesia and analgesia extending to the middle level of the thighs.

In questioning the patient it was revealed that he had some urinary disturbance, as he did not seem to feel the urine passing and was not aware when the bladder was full.

The spinal fluid examination showed slight vanthochromia as the only abnormal finding

Roentgenogram of the lumbar spine, after injection of the cisterna, showed evidence of obstruction in the spinal canal, at the level of the inferior margin of the second lumbar vertebra. In spite of the obstruction some contrast fluid found its way slowly along the periphery, latero-anteriorly

The diagnosis of neoplasm of the cauda equina was

The patient was transferred to the Neurosurgical Service of Dr Arthur MacLean The operation was performed on January 16, 1941, under intratracheal anesthesia. An incision was made over the spinous processes of the second to fifth lumbar Following incision of the dura, a smooth. soft, doughy-like mass was exposed, around which the cauda equina roots were compressed to fine The mass was excised in the ribbon-like structures midline, and two test tubes full of soft matter of putty-like consistency were removed, in which many short hairs imbedded in sebaceous material were A soft cartilaginous-like substance was also removed At the completion of the curettage, the superior pole of the sebaceous sack was dissected free, where it apparently arose in the filum terminale

Dissection was carried down into the upper sacral portion of the spinal canal, and additional sebaceous matter was found in this junction which was curetted. The dura was closed after aspiration of about 3 cc of lipiodol, which appeared in the exposed area on removal of the sebaceous sack.

The final diagnosis was dermoid cyst of the cauda equina and the spinal cord

The patient left the operating room in good con-

dition, but on January 18, 1941, while he was being turned on the side, he died suddenly of an embolus'

Case 2 — PB, a negro girl, aged 3, was referred on June 8, 1945, from the Pediatric Department of the New York Post-Graduate Hospital to the Skin and Cancer Unit, because of an ulceration of the vulva, which had been present for the past two years

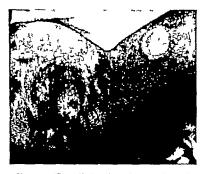

On the lower part of the left labuum majus there was a well-marginated, clean, smooth reddish ulcer of about 1½ by 1 inch in diameter, with indurated borders (Fig 3) The ulcer was painless and not tender. In the left groin there were a few enlarged, hard glands which rolled easily under the finger and were not adherent to the skin.

The child had paralysis of both lower extremities. The following history was obtained when the child was admitted on July 4, 1945, to the Pediatric Department, service of Dr. A. Ashton. At the age of six months the child underwent an operation for an acute left mastoiditis. Two weeks after she had apparently recovered from the mastoidectomy, she developed pneumococcus meningitis which confined her to the hospital for about three and a half months. Since that time she had paralysis of the legs and urinary and fecal incontinence. Six months later, she developed the ulceration on the left labium majus, which in spite of any treatment did not heal

On examination by Dr George A. Blakeslee the following findings were noted. The right pupil was 4 mm in diameter, and the left, 3 mm. The left pupil reacted more promptly to light and accommodation than the right. The right palpebral fissure was wider than the left. The deep reflexes were lost, except that of the triceps, which was diminished.

Fig 3 (Case 2) Trophic ulcer of two years' duration

Fro 4. (Case 2) Trophic ulcer of the vulva almost healed and a now ulcer at the inner aspect of the left thigh

The abdominal refleves could not be clicated. There were no plantar and no Babinsky reflexes. There was a loss of psin sensibility from the plantar surface of the feet up to the thoracic eighth at the left and at the right. The diagnosis of meningo-encephalomyelitis was made.

A biopsy from the edge of the ulcor of the vulvn showed chronic inflammatory reaction. On ac-

Fig 5 (Case 2) Low-power microphotograph of the edge of the trophic ulcer showing organizing granulation tissue with overlying acanthogia.

count of this report, together with the negative bacteriologic and serologic findings particularly regarding syphilis and because of the association with central nervous disease the diagnosis of trophic placer was made

Since then the patient was observed by us from time to time and the ulcer treated by attention to cleanliness and mild ointments On November 25 1946, the lesion on the left vulva was almost healed but another ulcer was observed on the inner aspect of the right thigh near the groin It was a half dollar sized clean, red smooth, well-defined ulcer ation with raised borders. Acording to information obtained from the mother, this ulcer had been present for two months and she attributed it to the pressure of the brace which the patient had to wear (Fig. When seen in December, 1946 the ulcer on the vulva had healed ontirely with scarring and depic mentation but the ulcer on the thigh did not show any tendency to healing On January 6 1947, a biopsy was taken from the edge of the new ulcer and the following report was made by Dr W Sachs. "The epidermis is tremendously acanthotic and is covered by a pronounced densely laminated horny layer beneath which is an increased granular layer There is no edema of the epidermis and the palisade layer is intact. In one edge of the section there is some necrosis of the surface. In the lower portion of the epidermis there is considerable pigmentation.

"Throughout the entire cutis there are numerous blood vessels of all sizes and shapes. Around the vessels there is a focal cellular infiltration composed of small, round cells, wandering connective tissue cells, and plasma cells. Between the vessels there is considerable increase in fibrous tissue (fibrosis) within which there is a moderate diffuse fibroblast cell infiltration."

Diagnosis Organizing granulation tissue with overlying acanthosis (Fig. 5)

In February 1947 this new ulcer had also healed but soon after it reappeared again. On April 4 1947 the ulceration of the left lablum majus had again recurred and there were in the permeal region numerous pear-sized ulcers surrounded by whittle, raised borders. The mother informed us that because of illness she had to neglect the care of the child who required strenuous attention because of incontinence When seen on April 25 1947 all the ulcers had healed and were covered with depigmented skin.

#### Comment

Case 1 has several points of interest worthy of consideration. It is of course, clear that the location of the growing dermoid cyst compressing the spinal cord and the cauda equina has determined the location of the ulcers with friction and pressure being a secondary though important factor. The fact that no marked sensory disturbance has been found in the area of the gangrenous ulceration on the heel leads the clinical observer to the thought that probably trophic innervation has been disturbed on which the normal metabolism and life of tissues depend—whatever

one may understand under the term "trophic" One may assume specific trophic nerves or one may conceive trophism to be a result of a harmonious combination of different nerve systems, particularly of the sensory and vasomotor apparatus

Of importance seems to be the fact that the gangrenous ulcer was preceded by hyperkeratosis and fissuring of the skin for a period of several years, and that the superficial ulcer on the left gluteal region had been present for about eight months before the spinal tumor was detected Hyperkeratosis as a manifestation of trophic disturbance of the nervous system frequently is mentioned in the literature, among others, by Pusey. The Campbell, 28 and Foerster 29

It is pertinent to conclude from the above facts that any ulceration and hyperkeratosis of the skin not otherwise explained should make one think of the possibility of an underlying nervous system disease A part of every thorough general examination should be attention even to minor lesions of the skin and consideration of troplic nervous disturbance in the differential diagnosis Had this rule been followed in this patient the diagnosis of a spinal cord tumor might have been made much earlier Any additional means of detecting a tumor of the cauda equina must be welcome to the neurologist In some cases of these tumors neither objective nor subjective motor involvement is found, and sensory disturbances may be so slight that only a suspicion of hyperesthesia over a root area can be discovered 26

In Case 2, it is of interest that the first trophic ulcer appeared on the vulva, six months after development of the paraplegia This fact is in agreement with observations made on the nasal trophic ulcers in encephalitic lethargica and in cases of nerve injury Mucha states that disturbed trophic functions of the skin may persist as a latent condition for a long time and eventually become manifest 25 Head, in experimenting on himself, observed the development of an ulcer three months following section of a nerve 30 The observation in Case 2 of comparatively rapid healing of the ulcer by paying attention to cleanliness, and thus avoiding maceration and infection, and, on the other hand, the reappearance of the ulcer when the care of the child was neglected, emphasizes again the importance of external factors in the formation of trophic ulcers. This observation seems to be in agreement with the statement of Bechterew, 21 who maintains that cellular tissue and skin can nourish themselves after having been deprived of any nerve connection, and with the observation of Mitchell32 that loss of innervation does not prevent cicatrization, which is proved by quick healing of gangrenous lesions produced by pressure in paralyzed patients

## Summary

- 1 Two cases of trophic ulcers were reported, one in association with dermoid cyst of the cauda equina and the spinal cord, and the other in acase of postmeningitic myelitis
- 2 The problem of specific trophic innervation was discussed
- 3 Trophic ulcers were divided into those with special characteristics malum perforans, decubitus, and nasal ulcers seen in tabes and in encephalitis lethargica, and into uncharacteristic ulcers seen in other different central nervous diseases
- 4 A plea for greater consideration of nervous system disease as an underlying factor in skin diseases is made

135 East 50th Street

#### Discussion

Maurice J Costello, M D , New York City — Dr Bloom has brought to the attention of the derma tologists the importance of the recognition of trophoneurotic ulcerations in the diagnosis of lesions of the central nervous system I believe he proved the causal relationship in these cases

I prefer the name trophoneurotic ulcer rather than trophic ulcer because the former appellation means an ulcer due to nervous disease of central origin whereas a trophic ulcer might be interpreted as one due to imperfect nutrition of the part

The absence of sensibility to pain, caused by degenerative changes in the nerves and trauma, is the factor which enhances the occurrence and perpetuation of these trophoneurotic ulcers, the most common example of which is the malum perforans occurring on the plantar surface of the feet

I have seen several examples of trophoneurotic I should like to describe briefly two which illustrate further the condition The first, presented before the Atlantic Dermatological Society in New York (Arch Dermat & Syph 42 685 ((Oct ) 1940), was a trophic ulcer of the nose The patient, H A., a man aged 47, a watchman, was first seen in Novem ber, 1938 He gave a history of sudden loss of speech and of a tingling sensation in the left ade of his body several days before a diagnostic spinal puncture was performed He stated that a sore appeared on the left ala nası on the following day While in the hospital he complained of excessive sweating limited to the left side of his body had an injury to the left side of his head twelve years before, accompanied by transitory hemiplegia. Examination revealed an ulcerating lesion of the left nostril with some destruction of the left ala nasi He also had a proliferative ulcerating lesion on the septum resulting in occlusion of the left nostril There was beginning atrophy of the septal cartilage In an area extending about one inch (25 cm) around the left nasal aperture there was a zone of reduess and scaling

Neurologic evamination showed generalized hyperreflexia, with bilateral Hoffman signs, and equivocal Babinski signs There was a transitory ankle clonus

No tubercle or lepra bacilli were found on the right on scraping the affected areas. Culture of the material showed Staphylococcus aurous, a few hemolytic streptococci and Micrococcus catarrhalis The Wassermann and Kahn reactions of the blood were negative on five occasions Blood counts were normal except for mild leukocytoms The urine was normal. Histologic examination showed papillary hyperplasia of the stratified squamous epithelium. hyperkeratosis, a small area of ulceration, and an acute inflammatory reaction. In the submucosa there was dense connective tissue with considerable inflammatory reaction. Histologic diagnosis was hyperkeratotic papilloma. The patient received several doses of neoarsphenamine and saturated solution of potassium iodide without favorable effect on the lesion, which healed eventually with great care provention of mechanical irritation and pick ing and with cleanliness and hygiene

A second example observed in the dermatologic wards of Bellevue Hospital, was that of a Sootchman aged 50 who had almost complete destruction of the left ala nasi following a severe attack of influenza associated with symptoms of encephalitis other possible causes of this lesion, such as syphilis, tuberculosis leprosy and trauma were ruled out

These two cases resemble those reported by Rosenberg and Solovay under the title, 'Trophic Ulcer Following Encephalitis Lothargica ' (Arch Dermat. & Syph. 39 825 (May) 1939)

#### THE DANGER OF METALS IN THE DIATHERMY FIELD

The spectacular advent of short-wave diathermy some fifteen years ago raised a number of problems as to its physical and physiologic effects and their bearing on practical uses. Extensive clinical and experimental work solved most of these problems and established the scope of employment and the safeguards of the technic of diathermy as a deep tissue heating agent. Among the earlier assertions disproved was the claim that certain wavelengths exert selective heating in the living tissues it was shown that the blood flow and the rapid interchange of heat in the living body will equalise any differ ence in heating of heterogeneous tissues in the depth. It was also shown that wavelength in itself plays a less important role in heating than the power output of the apparatus, the energy delivered to the petient, and the technic employed. In recent years with the increase of implanting metals in the tissues of the body by surgery a newer problem came to the fore, that of the potential danger of postoperative use of diathermy in these cases. Two comprehensive studies presented in the Archives of Physical Medicine should clarify this bothersome question. The observations of Etter et al. started as a watume research, disclose that histologic examination of tissues contiguous to metals showed no evidence of destructive effects from disthermy under ordinary treatment conditions. To a certain extent this appears to be in accord with the earlier cited observations about equalization of heat in the deeper

Lion's experimental setup corroborates the fact that with metals embedded deep in the tissues, the field concentration is of little practical signifi cance however overheating of tissues may still occur around metallic parts located on or near the surface. Hence, it may be safely stated that with surgical metals situated in the deep tissues and with no evi dence of impaired circulation, there is no danger of overheating with disthermy when standard clinical intensities are applied with the usual careful technic. -Archives of Physical Medicine June, 1947

# THE PREPARATION OF ELDERLY PATIENTS FOR LARGE-SCALE OPERATIONS

ABRAHAM O WILENSKY, M D, New York City

DISEASE of the caliber necessitating largescale operations has always existed for
such a long time that the patient generally shows
the effects of the illness in a depreciated state
marked by loss of stamina or "pep," loss of weight
and strength, various degrees of fatigue, the absence of the normal sense of well-being, and a
much lessened resistance to disease and to bacterial and other trauma of all kinds. This spells
lessened resistance to operative procedures. In
nearly all cases this state of affairs is tied up intimately with protein deficiency states, with
anemia, and in many cases with latent liver
changes both in function and later in structure

## Protein Deficiency and Hypoproteinemia

A general deterioration caused by protein deficiency and hypoproteinemia has been shown to be tied up with the albumin and globulin fractions of the protein metabolism 'The relative importance of the various protein fractions is In operative cases the now being understood assurance of an adequate supply of protein is most important for the following reasons The proteins protect the liver from the possible touc effects of anesthesia (2) They guard the body's ability to replace its losses through ordinary wear and tear as well as through extraordinary periods of disease and as a result of operative (3) They increase the ability and procedures readmess of wounds to heal by preventing tissue edema, and by supplying the essential nutrients required for tissue repair and regeneration proteins protect one against infection by increasing the antibody protection of the body furnish the factors which regulate blood clotting and control hemorrhage And an abundant. rich protein supply does away with fatigue, gives a sense of well-being and vigor, and helps in maintaining a proper cheerful frame of mind in the vicissitudes of large scale operations

The emphasis which has been placed on correcting dehydration and electrolyte losses before and after operation has often been accompanied by failure to consider the mechanism involved in keeping fluids in the blood vessels (Starling hypothesis) Proper control of the fluid and electrolyte balance in surgical patients receiving parenteral fluids is not possible unless the serum-protein concentration is maintained within normal limits

Minerals are also important in the body They add to the general effect of a sufficient protem supply, and they provide the necessary bases

The measure of any protein deficiency can be approximated by repeated estimation of the blood plasma level of protein Whereas the normal level varies from 5 6 to 6 5 mg per cent, many of the patients, even though superficially they may look well nourished, have levels below this When, in the presence of low levels, the patient looks in good condition, it is well to assume that the protein reserves are not so abundant as they should be When the patient obviously looks undernourished, or even cachectic, it must be assumed that the protein reserves are depleted to an extent which would increase the risk of operation, handicap the recovery therefrom, and interfere with the subsequent healing

## Anemia

Varying degrees of secondary anemia are constantly present and are related to any coexisting hypoproteinemia. The anemia, of course, depends upon any hemoglobinolytic effect of any malignancy and upon the amount of bleeding which has preceded In general, when faced with these extensive operations, transfusions of whole blood are most advantageous When the hemoglobin level and red blood count is below 60 per cent, I consider preoperative transfusions mandatory When the figures are somewhat higher, one may sometimes omit the transfusions before operation and use other methods of supportive build-up, but, in many of these cases, the transfusion should be given directly after operation in order to help counteract the trauma of the operative procedure Many times it is advantageous to transfuse the patient both before and after operation When repeated transfusions are necessary, the Rh factor must be investigated

An important point, usually not appreciated, is that the protein deficiency and anemic states exist for a long time, their restitution to the normal by pure replacement therapy cannot be done quickly. The important item to replace is the normal reserve supply of protein, and this can be built up gradually only by repeated and persistent effort.

In the preoperative preparation of patients with malnutrition, protein deficiency, hypoproteinemia, and anemia, one must consider the double nutritional disturbance resulting from first, the primary illness (gastrointestinal disease with either vomiting and/or diarrhea, carcinoma,

dysentenes, hyperthyroidism, hepatic disease, and so on), and second, the operation itself

In calculating the daily necessary amount of protein, the following factors must be considered (1) the patient's nitrogen balanca, (2) the estimated degree of deficiency in the tissue and reserve protein, and (3) the possible con tinuance of the original disability which caused the deficiency if one exists, finally, an additional amount of protein should be given to allow for any unayordable error in the computation

One can calculate the daily requirement as follows

(MED+DL+NUP) × 2

MED = minimum endogenous daily protein need usually 25 Gm,

DL - daily loss of protein determined from

NUP = part of diet which is not utilized (estimated)

The factor 2 is chosen arbitrarily to make good any error and to furnish the additional protein from which the contemplated gain is to be made in the correction of the protein deficiency. This calculation can be made quite easily, and such amounts permit the subject to regain the normal protein content with a speed that the body can tolerate. In good subjects, the arbitrary factor 2 can be ruised to 3, and even 4. The presence of any hepatic parenchymal disease of any grade makes for difficulty because of the inherent inability of the diseased liver to metabolize the administered protein.

If no success follows in the mild cases or it follows in manificient degree, if the grade of the protein deficiency is severe or extreme, or if there is any necessity for urgency in the correction of the hypoproteinemic state, more active measures are necessary, including the parenteral replacement of protein. Parenteral replacement of protein. Parenteral replacement of protein can be accomplished by (1) the transfusion of fresh whole blood, (2) the transfusion of wet or dried human plasma, (3) the reinfusion of human transudate fluid (ascitic and/or pleural), and (4) the use of amino acids

#### Cardiovascular and Renal Disease

When cardiovascular disease is present, it necessarily becomes a major item in the preparation for operation. The patient either has hypertension or cardiac disease proper and/or coronary artery disease as the major factor

Most patients in the later periods of life have more or less hypertension. Usually this does not influence either the choice of the method and/ or the drug used for the anesthean nor the conduct of, and/or the reaction to the operature procedure In bad hypertensive cases, especially with renal manifestations and persistent grades of asotemia, the risk of operation is considerable. It is regrettable, however, that the usual methods aimed at reducing hypertension are not so effective as one would like. Nor is there any available method of estimating the operative risk under such conditions.

The problem with cardiac disease proper is different. The main items include the amount of myocardius present, the degree of cardiac compensation, and the effective amount of cardiac reserve which are present. In any case the condition of the lungs and the likelihood of any bronchopulmonary edema must also be considered.

The preparation of patients with selectic valvular disease is not too difficult. Unless a myocarditis of an extensive grade is also present, the cardiac mechanism can be brought up quickly to a satisfactory state, and then there is little or no difficulty either immediately or in the subsequent postoperative period. The main reliance should be put on rest in bed and the use of digitalis and/ or of quinidine where indicated

The preparation of patients with coronary disease is an entirely different and a more difficult matter. The patient should never be without the attention, and the surgeon should never be without the help and advice, of a competent cardiologist. The following are important items in considering the risk of operation.

- 1 An important factor is the length of time between the onset of the coronary disease, especially of any initial acute closure, and the performance of the operation The longer this period is, without any further or repeated coronary epi sodes of coronary closures, the less risk there is. The condition is somewhat different when the closure is a long, slowly occurring affair
- 2 The degree of muscular involvement in the infarcted cardiac area determines the degree of cardiac compensation and the extent of cardiac reserve. At the present writing, there is no method whereby one can measure the reserve capacity of a diseased heart with any degree of acouracy especially for the judgment of a surgical risk. This is one of the most difficult items for consideration in the preparation of these patients for surgery.
- 3 Embolic phenomena are common in cardiac disease, especially in acute coronary closures. The important ones occur in the brain the lung and the kidney. When the disturbance created by one, or more than one of these embolic lesions in sufficiently great, operation should be refused as the risk is almost absolute. This is one of the times when experience and judgment are the best guides.

Cerebral Episodes.—The occasion arises when one must operate upon an individual who with or without preceding cardiac disease, has gone through a cerebral accident, either embolism or hemorrhage The important items upon which judgment is based include (a) the length of the interval since the occurrence and the recovery from the cerebral episode, (b) the amount of residual disturbance, (c) the presence of other similar vascular lesions, (d) the underlying provocative disease, and (e) the general condition The amount of residual paralysis of the patient is not so important in integrating these facts with the rest of the picture and in estimating the risk Here, again, mature judgment based upon adequate experience is as important in making these judgments as any laboratory or clinical criteria

Renal Disease —The association with renal disease both with and without cardiac involvement is common. The case should be well studied with special attention to the total urmary output, to any changes in blood chemistry, to the degree of azotemia, to any existing edema, and to any other associated condition. Again, one's best guides are experience and mature judgment in integrating the observations, in measuring the risk, and in taking the proper preparatory precautions.

Pulmonary Episodes -- Embolic phenomena are very frequent in the lungs, the lungs are also very susceptible to infection Commonly, both of these forms of disease are combined Large consolidations are less common than scattered Because of these facts, the facility with which bronchopulmonary edema may appear suddenly is a serious and dangerous matter. This danger becomes much magnified when the necessity for intravenous alimentation is present The danger of overloading the circulation with a sudden influx of fluid, when heart reserve is at a minimum, must be avoided Therefore, one should give a small amount at a time and give it Episodes, nevertheless, will occur and confound us even when the patients are under the most expert observation Operation in such individuals is so risky that it ought many times be refused

Blood Chemistry Determinations—Determination of the degree of an associated azotemia is very important in establishing the gravity of disease and of the operative risk in many conditions. This has special reference to all forms of renal disease, to cardiovascular disease in general, and in acute coronary seizures in particular. They are also of value in hepatic parenchymal disease, both because of the liver lesion itself and because of any secondary kidney effects (e.g., hepatorenal syndromes). Whenever possible any deviation from the normal should be corrected before any

operation is undertaken. Unfortunately, however, this is possible to a very limited degree only, if at all

In conditions associated with intestinal obstruction, various grades of azotemia are commonly present and should be interpreted as a measure of the length of time for which the obstruction has existed. Usually no preoperative measures are possible because of the immediate dominating necessity for the relief of the obstruction. The clinically established fact is, however, that the successful release of the obstruction is followed by a spontaneous return of the azotemia to the normal. In patients who are dehydrated, parenteral glucose in saline in sufficient quantity should be given preoperatively and continued, in bad cases, throughout the operation

#### Diabetes

Except in very marked cases, the additional preparation needed for this factor is not much. The diet is not cut down too extensively and whatever glycosuma or hyperglycemia is present is better adjusted with appropriate amounts of either simple or protamine insulin as the occasion demands. In severe diabetics, there is no objection to and, possibly, some advantage in permitting a slight glycosuma to remain. Nevertheless, there is no objection either in the severe cases or in the milder cases to having the patient completely sugar free. There is never any difficulty with this group of diabetics either before or after operation.

When acidosis is present, or in bad diabetics, the preparation takes longer, and sometimes careful jockeying of diet and insulin is necessary before the patient is in satisfactory condition for operation. It seems better, as indicated previously, to content oneself with reducing the glycosuma to around 0.5 per cent, but any acidosis should be eliminated entirely. With good medical cooperation, I have never had a patient who could not finally be brought into satisfactory condition.

## Preoperative Chemotherapy

In all patients the attempt should be made to minimize or avoid postoperative bacterial infection by the use of penicillin and the sulfa group of drugs, preoperatively, locally in the operative area at the conclusion of the operation, and postoperatively

Certain toxic effects of the sulfa drugs have been reported in the literature which are important from the point of view of the cardiac mechanism French and Weller<sup>2</sup> and Dozzi<sup>2</sup> have reported an interstitial myocarditis, rich in eosinophil cells Fortunately these occur rarely

#### Postoperative Care

In all patients and especially in elderly and/or handicapped patients who have undergone any large-scale type of operation, it is important that the care carried out before operation for any of the various complicating or associated disabilities be continued in the immediate postoperative period, in order to continue its good effect and to forestell and counteract the additional injury and/or physiologic disturbance by which the operative procedure was necessarily followed Such complications as cardiac, renal, pulmonary etc. should receive the appropriate attention they need The following are especially important.

Postoperative Hypoproteinemia. —A state of negative nitrogen balance exists for varying periods after operation The important factors include (1) anesthesia (2) a major surgical procedure with operative manipulation of deeply situated viscera and tissues, (3) a brief period of starvation, (4) shock, fever, vomiting and the presence of injured tissues.1

The major portion of the protein loss occurs during the first four or five days after operation and, ordinarily, this brief period of protein deprivation or limitation is well tolerated, and the vast majority of patients recover without any special attention to the temporary abnormality

In all other patients in accordance with the degree of the deficiency the length of time it has existed, the nature of the operation, and so on, the deficiency should be calculated and roplaced as in the preoperative preparation, of which the postoperative therapy is only a continuation, with some intensification of the program.

Postoperative Authenia -It has been noted clinically that following major surgical operations of various types there is frequently a rather prolonged asthema Leriche has referred to this syndrome, which cannot be defined clearly as 'maladic postoperatoire," and ascribed it to generalized disturbances of the sympathetic nervous system. This form of asthenia has been encountered, perhaps, most often after operation upon the pancreas-pancreatic asthenia (Whipple"), and less often upon the gallbladder and liver

or after severe destructive disease. Concerning all of these forms of postoperative asthema, further investigation is necessary. But it is interesting to speculate upon the possible role of any postoperative nitrogen loss in this connection the quantity of tissue protein lost may not be large, it might be sufficient enough to account for the symptoms

#### Summary and Conclusions

Modern surgery has achieved its great successes because of (1) a more profound knowl edge of the pathogenesis and mechanism of discase processes, (2) the resultant changes in the normal physiologic processes and (3) a better appreciation of the role of independent and/or resultant associated abnormalities or disease which commonly complicate the essential lesion for which surgery is contemplated

The important associated abnormalities include (1) protein deficiency states and hypoprotememia. (2) anemia (3) the various forms of circulatory and cardiorenal disease including embolic lesions in the brain, lungs etc. and (4) diabetes These extraneous factors increase in frequency and severity with the increasing age of the patient the presence of a malignancy and the severity of the surgical lesion. This has stimulated a greater understanding of the necessity of properly preparing patients for the large scale operations which today are commonly necessary There is a better understanding of the subject of anesthesia, better training and better technical ability marked by courage upon the part of the operating surgeons, and a better understanding of the postoperative period and of more efficient postoperative care plus the addition of modern methods, including blood and plasma transfu mon and the use of predigested proteins (hydrolvantes)

#### 1947 EDITION OF PARERGON

Parergon is Mond Johnson & Company's picture

book of artistic works by physicians.

The current edition is a book of 208 pages and shows 1 100 examples of creative art by contemporary physicians.

This book is available without charge only to physicians.

Requests for it should be addressed to Mead Johnson & Company Evansville 21 Indiana.

## SOME OBSERVATIONS ON TUMOR OF THE ACOUSTIC NERVE

BERNARD C MEYER, M D, New York City

(From the Neurological and Neurosurgical Services of the Mount Sinai Hospital)

In THIS communication only selected features of the problem of acoustic neuroma will be emphasized. To the reader familiar with Cushing's classic monograph on the subject it will be evident that little can be added to his lucid and thorough study of nineteen years ago. However, it seems worth while to repeat and underscore some of the more subtle points which tend to be forgotten and thus provide a source of unnecessary controversy. In addition, some features of the problem not mentioned in Cushing's book will be presented briefly.

The material presented is comprised of most of the proved cases of acoustic tumor admitted to the Mount Sinai Hospital in the past twelve years. This includes 40 odd cases, of which 42 have been selected as suitable for presentation. The diagnoses were established either at operation

or autopsy

The classic history of tinnitus and diminution of hearing over an extended period of time followed by vertigo and cerebellar symptomatology is too well known to be reviewed here cases under discussion it was the rule that auditory symptoms preceded all others, although rarely this was not the case Cushing stated that "when the maugural symptoms of a growth, obviously situated in the angle, have another sequence with secondary acoustic symptoms, the diagnosis must remain uncertain until the lesion is exposed " One symptom, also noted by Cushing, which was presented by at least 3 patients, is of considerable importance because of its susceptibility to misinterpretation, namely, motor twitchings of the affected side of the face, eyelid, In 1 patient in our series this was interetc preted as an indication of a cortical focus, leading to the conclusion that the case was one of tumor of the hemisphere Cushing stated "Irritative symptoms referable to the facial have been more frequently recorded than is commonly supposed " It is noteworthy that in his case number 22 a mistaken diagnosis of Jacksonian epilepsy was made on that basis

The ages of the patients at the time of admission ranged from 17 to 65, and were distributed as follows

10-20	1 (17 years)
20-30	3
30-40	11 )
40-50	12 }33, or nearly
50-60	10 ) 80 per cent
60-70	6

Cushing's youngest patient was 21 The majority in his series were in the fifth decade of life

## Involvement of the Fifth and Seventh Cerebral Nerves

Next to the eighth cerebral nerve the fifth and seventh are the most frequently affected in this condition, yet the relative importance of the involvement of each is a continued source of discussion and misunderstanding In the 42 cases studied the sensitivity of the ipsilateral corneal reflex was noted in 40 instances A reduction of the reflex was noted in 18 instances and its disappearance in the remaining 22 In other words. the corneal reflex was reduced or absent in 100 per cent of the cases in which it was examined Objective evidence of involvement of other sensory functions of the fifth nerve was less frequently observed Thus, in 25 per cent, sensation on the face was judged normal In 1 case it was markedly diminished, in 10 cases it was slightly diminished, often limited to the mucous membranes, in 2 instances it was doubtfully lowered, in 18 cases it was moderately though definitely diminished Consequently, it is evident that even if the "doubtfully and slightly reduced" cases are included, at least 25 per cent of the patients in this series display normal sensation on the face judged by objective testing, even though the corneal reflex may be affected ing stated that "attention should be drawn to the that in a few patients the loss of the corneal reflex was the only demonstrable evidence of trigeminal involvement. The most delicate objective evidence of a trigeminal involvement is unquestionably the lowering of, or the loss of, the corneal reflex on the affected side, and a normal corneal sensitivity was retained in only 4 of the 30 patients in whom the condition was carefully noted on the history "

Motor disturbances of the nerve were noted only three times, but this is of no significance since it is not likely that evidence of motor involvement was looked for in every case. Cushing noted deviation of the jaw to the affected side in 12 of his 30 cases, and always in conjunction with marked sensory involvement.

In sharp contrast to the frequent occurrence of sensory fifth involvement, which in the case of the corneal reflex reached 100 per cent in this series, is the relative rarity of significant asymmetries of facial innervation. Thus, 12 cases

displayed no facial asymmetry whatever, 13 showed "questionable" or "suggestive" weakness 9 showed "slight" weakness, and only 7 revealed a definite facial weakness. In other words, the aggregate of normal innervation, "suggestive," and "slight" facial weakness amounts to 83 per cent of the total cases showed a significant facial weakness. It is of further interest, moreover, that in the 7 cases comprising this group, the weakness displayed in 3 instances was not a clear-cut, lower motor neurone paresis.

In some cases a disorder in the sense of taste on the antenor aspect of the tongue was more noteworthy than the facial weakness. Thus in 1 case in which no facial asymmetry was apparent, a suspicion of agousia was noted on the same side as the auditory disturbances. In 4 of the 13 "questionable" or "suspicious" cases of facial weakness there was a definite agousia. These findings suggest that taste sensitivity is a more subtle indicator of the seventh nerve involvement in these cases than is motor activity

Cushing's observations on the subject of facial innervation are in keeping with these findings Whereas he found that 19 of the 30 patients in his series revealed some degree of facial weakness, he added that "in the majority of the cases the paresis was little more than an inconspicuous asymmetry shown in the lower facial muscles a planing out of the nasolablal fold apparent only during expressional movements This is remarkable in view of the fact that the nerve must often be pressed upon within the canal further remarked "The nerve may be elongated in its course to an amazing degree without producing any palsy whatever It normally should measure only about 10 mm but in Case XV, for example, it was 50 mm in length and though flattened to almost paper thinness, the patient showed but very slight expressional weakness of the lower face '

In the writer's expenence these remarks are repeatedly ignored or forgotten During discussions about a possible diagnosis of acoustic tumor one repeatedly hears the objection But there is no seventh nerve involvement!" The findings of the series herein reported confirms Cusling's observation that striking involvement of the facial nerve is a rare phenomenon in tumor of the acoustic nerve.

#### Pyramidal Tract Involvement

Cushing noted that "as a rule (the reflexes) were equally active on the two sides, though in 8 the homolateral reflexes were the more active with an occasional suggestion of clonus at the ankle and in these cases, also there was a sug

gestive dorsal toe response on the same side." In the Mount Sinai series ipsilateral hyperreflexia was noted in several instances, sometimes with a defective toe response and, sometimes, with weakness. Less frequently the hyperreflexia was contralateral. In the majority of instances no asymmetry of reflexes, whatever, was noted. Presumably the greater frequency of ipsilateral than contralateral hyperreflexia is due to pressure of the contralateral pyramidal pathways (above the decussation) against the rim of the foramen magnum.

#### Miscellaneous Observations

Spinal Fluid Protein.—No mention of this occurs in Cushing's monograph. In this series the spinal fluid protein was noted in 20 cases, in all of which it was pathologically increased. The lowest value was 64 mg per cent, the highest was 500 mg per cent. The protein in 14 out of 20 spinal fluid examinations, or in 70 per cent, measured botween 100 and 200 mg per cent.

Blood Pressure—Lamiting the definition of arternal hypertension to individuals whose systolic pressure is over 140 mm and/or whose diastolic pressure is over 00 mm, 12 of 37 individuals showed hypertension. However, 8 of the 12 had borderline hypertension according to this definition and there is, consequently, no evidence that hypertension is found more frequently in accounter tumor than in the general population of this age group

Electroencephalographic Fundings —Variable electroencephalographic tracings were reported on the patients in this series, ranging from normal records to others suggesting focal lexions in the hemispheres. In general pathologic electroencephalographic tracings tended to be non specific and were reported as consistent either with epilepsy or with lexions affecting the third ventricle, as for example internal hydrocephalus due to tumor of the posterior fossa

#### Surgical Aspects

The operations performed on these patients consisted either of simple enucleation of the contents of the capsule or of intracapsular enucleation followed by the removal of all or part of the capsule A controversy still exists concerning the relative ment of each procedure introduced the practice of total extirpation in 1922 and later the device of "uncapping" the Horrax and Poppen advocate cerebellum this method 2 In their hands there is no question of preserving the facial nerve they actively curette the internal auditory meatus so that facial paralyses occur in virtually 100 per cent of the cases afterward they perform nerve anastomoses which they declare function well after about a year

Although they acknowledge a higher operative mortality and admit the disadvantages of facial palsy, they feel that the possibilities of recurrence after simple enucleation and the difficulties in performing secondary operations Cushing, on the other justify this approach hand, tended to adhere to his more conservative procedure of simple enucleation although he conceded the temptation to remove the capsule Yet, he added, "the procedure cannot be unreservedly recommended, as it was in so doing that the hemorrhage occurred which led to the operative complications in case VIII and XIX and the ultimate death of these patients, and in case XXIX to a widespread injury of all the adjacent nerves" In reviewing the matter in 19323 he stated, "I have repeatedly, in years gone by, after a series of favorable cases, some of them with near total extirpations, suddenly been confronted by a fatality from being overradical and have then dropped back to a more conservative attitude, only to have the same cycle repeated" That he did not share the opinion of some others regarding secondary operations is indicated by his further remarks "In the average case, if the pressure effect of the tumor can be so far overcome by an intracapsular excavation as to permit a subsidence of the choked disk and thus to save vision, one may well be content, and should a secondary operation for recurrence ever be necessary, it need not be particularly dreaded "

Actually, he reported several cases in which he performed successful secondary operations as well as others who developed no recurrences, despite the fact that the capsule had been left behind

The experience of the Mount Sinai series agrees closely with the above impressions Simple intracapsular enucleation carried a lower mortality as well as a very much smaller incidence of facial paralyses than did intracapsular enucleation followed by removal of all or part of the capsule. In the cases where all of the capsule was removed, facial paralysis occurred in every instance. In 10 cases where part of the capsule was removed, facial paralysis resulted in 6 instances. Recurrences of large tumors occurred within a year in 4 instances of simple enucleation, but in 4 other cases treated in the same manner, no recurrences had been noted in four, six, seven, and ten years, respectively

It is difficult to explain these discrepancies in the further history of acoustic tumor following simple intracapsular enucleation, but that recurrences do not occur in some instances might be an argument in favor of a procedure which spares the facial innervation. The psychologic effect of a facial paralysis is as important as, if not more important than, the possibility of a recurrence. Again to quote Cushing "The mere lengthening of life is not a desirable basis on which to estimate end results unless the life has been made better worth living"

### **BIRTHS SET NEW RECORD IN 1947**

There is every indication that the number of births in the United States in 1947 will exceed the 3,440,000 mark set last year, and will thus establish a new all-time high record

Through May of the current year there were, according to provisional figures, about 1,572,000 births as against approximately 1,116,000 in the corresponding period of 1946, an increase of about 456,000

babies, or more than 40 per cent

The extraordinary record for 1946 was due very largely to the unusually high birth rates in the second half of the year. Even in May last year, instead of the usual seasonal decline in the birth rate, the rate increased sharply and continued upward at an accelerated pace during the summer months. Again, in place of the normal drop in the birth rate in the fall of the year, the curve for 1946 continued to climb

without interruption until the very end of the year, reflecting the effect of the rapid demobilization of our armed forces after the close of the war in the summer of 1945

Unquestionably the 40 per cent excess for the first five months of 1947 will be whittled down as the year progresses, but even if the number of births in the last seven months of the year remains at the level of that for May, the record for 1947 will materially exceed that for 1946

It may well be that 1947 will hold the record for numbers of births for some time to come. In any case, the marked drop in the marriage rate for the first five months of the current year as compared with last, foreshadows a drop in the birth rate in 1948—Metropolitan Life Insurance Company Statistical Bulletin. July. 1947

#### THE TREATMENT OF EARLY SYPHILIS WITH PENICILLIN AT BELLEVUE HOSPITAL\*

Evan W Thomas, M.D., New York City

(From the Department of Dermatology and Syphilology, New York University College of Medicine, and the Department of Dermatology and Syphilology Third Medical Division (New York University) Bellevie Hospital)

ALTHOUGH the treatment of early syphilis with penicillin was inaugurated on a fairly large scale in November, 1943, the statistical data of the results of treatment do not yet mye us the information needed for an authoritative statement on the optimum plan of therapy due to a number of reasons, chief of which are the chronicity and relapsing nature of the disease

As is well known, the evaluation of any new spirocheticidal agent in the treatment of syphilis requires years of trial and a prolonged follow up of patients before any final judgment can be made Even with the most careful observation and a sustained follow up of patients, statistics on the results of rapid treatment for early syphilis cannot be taken at their face value, because of the difficulty in distinguishing between infectious relapses and reinfections Unquestionably many of the so-called failures of rapid treatment for early syphilis are actually reinfections. Never theless, until we have more scientific means of differentiating between relapses and reinfections. it is unwise to attempt to distinguish between them in making statistical analyses. Consequently statistics to date are viriated by an unknown number of reinfections.

With the use of penicillin, additional difficul ties have been encountered in evaluating the results of different rapid treatment schedules because of the varying content of commercial penicillins over the past three years. Treponema pallida are not used in the bioassay of penicillin Only when the commercial penicillins were fractionated and the various crystalline products were tested against Treponema pallida was it discovered that fraction G was a more effective antisyphilitic weapon than any of the other avail able fractions The early commercial penicillins were believed to contain large amounts of fraction Subsequently, with changes in the method of growing the mold, the commercial penicillus were found to contain larger amounts of fraction K than G It is fairly cortain that the penicillins high in fraction K were much more effective against syphilis than when fraction K alone was used but the fact remains that we are forced to compare various schedules of penicillin therapy with no exact knowledge as to the relative merits of many of the penicillins used.

It was not until June 1946, that crystalline G penicillin was produced in sufficient quantities for large scale use in the treatment of early syphilis. Beginning July 1, 1946, at Bellevue Hospital under the direction of the Subcommittee for Venereal Diseases of the National Institute of Health, we started four different schedules of therapy for early syphilis, using the same lot of penicillin G for all patients. Today it is possible to give only a tentative report on the results of a six months follow up of the patients treated with these four schedules, but within another year we should have information that will be more valu able than our present report which deals largely with the results of therapy when varying lots of commercial penicillins were used

#### Schedules of Treatment

Since December, 1943, we have used nine dif ferent schedules of rapid treatment for early syphilis using peniculin alone or penicullin in combination with arsenoxide and/or bismuth of the treatment schedules were assigned to us by the Subcommittees for Venereal Diseases of the National Research Council or the National Institute of Health Unfortunately, owing to the shortage of penicillin during the war, the earliest schedules of therapy assigned to us called for the smallest amounts of penicillin. Therefore the series of patients followed-up for the longest periods were treated inadequately best treatment schedules used by us were started less than eighteen months ago Nevertheless, the results of the various treatment schedules are revealing and of definite value in spite of the differences in the periods over which patients have been observed

Table 1 gives the plan of treatment in each of the nine series of patients, the number of patients treated in each group, the number of patients followed up and the results of treatment up to March 31 1947 Only those patients who have been observed for at least six months after the completion of one course of treatment are in cluded in the table All of the patients treated in the nine series had darkfield positive early

Presented at the 141st Annual Meeting of the Medical Society of the State of New York, Buffalo Panel Discussion on Syphilia Section to Dermatology and Syphiliador Friday, May 9 104".

Added by grants from the Office of Scientific Research and Development and the United States Public Health Service

TABLE 1 -PLAN OF TREATMENT IN THE NINE SERIES OF PATIENTS

Series Number	Amount of Penicilin and Dosage	Number Treated	6 Months or More	- Follow up 2 Years or More	To March 31, 1947	Satisfactory Status	Unsatusfactory Result
1	November 26, 1943-June 30, 1944 10,000 units every 3 hours for 60 dones (600 000 units of sodium pencil lin)	881		249 (65 <b>4</b> %)		136 (54 6%)	113 (45 4%)
2	July~November, 1944 40,000 units every 6 hours for 30 doses (1 200 000 units of sodium penicil lin)	687		444 (64 6%)		(56 7%)	192 (43 3%)
3	November, 1944-December, 1945 20,000 units every 3 hours for 60 doses daily in jections of 0.04 Gm arsenoxide for 8 days (1,-200 000 units of penicillin and 0.32 Gm arsenoxide)	1,146		239	712 (total) (62 1%)	498 (70%)	214 (30%)
4	August, 1945-July 30 1946 600 000 units calcium penicillin in beeswax and peanut oil daily for 8 days (4 800,000 units)	802			529 (60%)	450 (85 1%)	70 (14 9%
5	March-July, 1946 40 000 units every 3 hours for 60 doses daily in- jections of 0 04 Gm ar- senoxide for 8 days, 5 injections of 0 12 Gm metallic bismuth (2,400,- 000 units of penicilin, 0 32 Gm arsenoxide, 0 6 Gm metallic bis- muth)	233			182 (78 1%)	164 (90 1%)	18 (0 9%)
6	July 1-September 30 1946 40,000 units penicillin G every 3 hours for 60 doses (2 400,000 units crystalline penicillin G)	76	63 (85%)			58 (92%)	5 (8%)
7	July 1-September 30, 1946 26,666 units peniculun G every 2 hours for 90 doses (2,400 000 units crystalline peniculun G)	76	59 (80%)		,	58 (98 2%)	(1 8%)
8	July 1-September 30, 1946 80,000 units penicillin G every 3 hours for 60 doses (4,800,000 units crystalline penicillin G)	83	68 (82%)			62 (91 2%)	(8 8%)
9	July 1-September 30, 1946 53,333 units penicillin G every 2 hours for 90 doses (4 800 000 units crystalline penicillin G)	93	74 (80%)			72 (97 3%)	(2 7%)

syphilitic lesions when treatment was started In the time allotted, it is impossible to give a

In the time allotted, it is impossible to give a detailed analysis of these nine groups, but I would draw your attention to the fact that, in spite of the variables already mentioned, these series, with the exception of the last four, represent relatively large numbers of patients followed-up for sufficient time to have genuine significance. The differences in the percentages of satisfactory results between the first three schedules of therapy and those used later with more adequate amounts of penicillin are statistically significant

#### Discussion

From the data given in Table 1 it is apparent that the treatment of early syphilis with 1,200,000

units of commercial penicillin in eight days is inadequate. Even when daily injections of 0.04 Gm of arsenovide for eight days were added to 1,200,000 units of penicillin, poor results were obtained. This may be due in part to the quality of the penicillin used, much of which was probably high in fraction K. Nevertheless, it is advisable to give more than 1,200,000 units of penicillin in eight days for the best results in the rapid treatment of early syphilis.

Good results were obtained with the use of 2,400,000 units of penicillin in seven and a half days (Series 5, 6, 7) One of these schedules (number 5) combined 0 32 Gm of arsenovide and 0 6 Gm of metallic bismuth with 2,400,000 units of penicillin Most of the 182 patients followed-up in this group have been under observation for

a year or more, which is a longer period of posttreatment observation than has as yet been possible in the penicillin G series. Nevertheless, it is doubtful whether the addition of arsenoxide and bismuth is necessary, because the series receiving 2 400,000 units of peniculin G alone (Series 6 and 7) have had just as good results for a six months' follow-up period as were obtained with a similar amount of penicillin with the addition of arsenoxide and bismuth Furthermore, most of the so-called failures in Senes 5 to 9 were probably reinfections To prove my contention that they were reinfections would necessitate giving the case histories of each of the so-called unsatisfactory results This would require more time and space than I have The following brief case histones of the unsatisfactory results in Sones 6 and 7 will serve as typical examples.

#### Treatment Failures

In the following case reports the treatment schedule used was 40,000 units of penicillin every three hours for 60 doses (2,400,000 units of penicillin G)

Case 1—C H a negro man, aged 25 was first treated for secondary syphilis from August 2 1046 to August 9 1046 The quantitative kahn test was 256. It fell to 3 on December 5 1046 On December 30 1046, it was 32 at which time the patient had a small darkfield positive chancre inside the meatus. He also had genorrhea and secondary lesions on the trunk and extremities which were darkfield positive. He had sexual relations with M. W following his original treatment M. W, has contact, was treated at Bellevue Hospital for darkfield positive secondary syphills on December 10 1046 The impression was reinfection.

Case 2 — A. C a negro man, aged 27 was treated for zeropositive primary sphills from August 19 1946, to August 27, 1946 The quantitative Kahn test was 123. On October 10 1946 it was 22 at which time he was found to have a darkfold positive chancre at a different site from his original chancre. The patient admitted sexual relations with B M the first week after his discharge from the hospital B M. his contact, was found to have secondary sphills on October 11 1946. The patient was retreated from October 19 1946 to October 27 1946 and was seronegative two months later The impression was reinfection.

Case 5—M B a negro woman, aged 24, was treated for secondary syphills from August 30 1946 to September 7, 1946 at which time her quantita tive Kahn test was 2 048. The Kahn test on December 5 1946 had fallen to 32. On January 20 1947 it had neen to 256 and she was found to have a generalized macular papular rash. She admitted regular relations with her friend, A. W., with whom she had sexual relations prior to her original treatment and resumed sexual relations two weeks after her treatment. The impression was a probable reinfection.

Case 4.—H. B a negro woman, aged 19, was first treated for secondary syphilis from September 17, 1916 to September 25 1916 at which time her quantitative Kahn test was 1 024 The Kahn test on December 19, 1946 was 64 and on February 21, 1947, it was 128 She returned on February 27, 1947, at which time she had darkfield positive secondary lesions. She admitted regular exposures, following her original treatment with her husband who was found to have darkfield positive secondary lesions on February 29, 1947 The impression was reinfection

Case 5—B W a negro woman aged 23 was first treated for secondary syphills from September 20 1946, to September 28, 1946 The quantitative hahn test was 128. The Kahn test fell to 3 on Docember 5 1946 On February 3, 1947 it was 256 and the patient was found to have secondary lesions which were darkfield positive. She had had regular sexual relations since her original treatment with her husband, C W., who was found to have secondary syphilitic lesions on February 3 1947 The impression was reinfection.

In the following case the schedule of treatment was 28,666 units of penicillin every two hours for 90 doses (2,400,000 units of Penicillin G)

Case 6—Mc. S. a negro man, aged 22 was treated for seropositive primary syphilis from August 6 1046 to August 14 1046 The quantitative Kahn test was 16 at the time of first treatment. On January 8 1047 he returned with a new darkfield positive chancer at a different site from the original one and his Lahn test was negative He admitted numerous exposures. The impression was reinfection.

If we disregard attempts to distinguish between reinfections and relapses, the data given in Series 6 to 9 favor injections of penicillin G every two hours for 90 doses rather than every three hours for 60 doses. But the results so far indicate that nothing is gained by giving more than 2 400 000 units of penicillin G, provided individual doses are given every two or three hours.

#### Penicillin in Beeswax and Oil

Of greater interest than the results of rapid treatment with ponicillin dissolved in water are the results of treatment with daily injections for eight days of 600,000 units of calcium penicillin in beeswax and peanut oil (Series 4) Penicillin in beeswax and oil can be given in outpatient clinics or physicians' offices Our data show that 85 1 per cent of 529 patients followed up for nine months or more have satisfactory results following treatment with penicillin in beeswax and oil Half of the "failures" were probably due to reinfections, but, disregarding attempts to

distinguish between reinfections and relapses, the results of this treatment for a similar follow-up period compare favorably with the results obtained by giving arsenovide, fever, and bismuth for the rapid treatment of early syphilis at Bellevue Hospital. The results shown in Series 4 not only justify the use of penicillin in beeswax and oil for the treatment of early syphilis but also make it desirable for the treatment of patients who will report regularly on an ambulatory basis

I do not have the time to report on the results of retreatments of patients who relapsed or were reinfected A detailed study of these cases is of interest

Suffice it to say here that, although we have treated a number of patients four times, we have no evidence that anyone is penicillin resistant.

One patient who was retreated three times with increasing amounts of penicilin after his original treatment for early syphilis still has a quantitative Kahn test of 64 more than six months after his last retreatment, but his spinal fluid findings which were originally positive have become normal

So far we have found no patient treated for early syphilis with positive spinal fluid findings which failed to become normal after one or more courses of penicillin

## Summary

In concluding I would like to emphasize again that we do not yet know the optimum plan of penicillin therapy for early syphilis. Enough information is available, however, to prove that penicillin in adequate dosage is superior to any other antisyphilitic agent. When penicillin is dissolved in water individual injections should be given every two or three hours for a total of 2,400,000 units. Giving more than this amount in a seven- or eight-day period seems unnecessary

Penicilin in beeswax and oil has proved effective in the treatment of early syphilis when given in daily doses of 600,000 units for eight days Possibly equally good results could be obtained with smaller amounts. Also, it may well be found in the future that injections of penicillin in beeswax and oil can be given less frequently over a longer period of time with satisfactory results. Much remains to be learned about the optimum period of treatment, but, in the meantime, we are fortunate in having an effective, relatively nontoxic weapon added to our armamentarium in the treatment of syphilis.

## SCIENTIFIC EXHIBITS 1948 ANNUAL MEETING

Applications for space for the scientific exhibits should be made directly to Chairman of Subcommittee on Scientific Exhibits of the Convention Committee

Dr J G Fred Hiss 505 State Tower Building Syracuse 2, New York

The Annual Meeting will be held May 17 to 21, 1948, at the Hotel Pennsylvania in New York City

No Applications can be considered after January 15, 1948

There will be two groups of awards

Awards in Group I are made for exhibits of individual investigation, which are judged on the basis of originality and excellence of presentation

Awards in Group II are made for exhibits which do not exemplify purely experimental studies and which are judged on the basis of excellence of presentation and correlation of facts

W P Anderton, M.D., Secretary

## TREATMENT OF LATE ACQUIRED SYPHILIS OTHER THAN NEUROSYPHILIS

JAMES W JORDON MD, and FRANK A DOLCE, MD, Buffalo, New York

(From the Department of Dermatology and Syphilology University of Buffala School of Medicine)

MUCH data on the treatment and outcome of treatment of early syphilis is available in the literature, since it is quite easy to determine the effects and efficacy of treatment on this form of syphilis Recent literature has numerous refer ences to various rapid methods of treatment. employing arsenicals, bismuth compounds, and antibiotics There are several guides which may be used in determining the efficacy of this treatment such as the healing of local lesions, disappearance of spirochetes from the local lesions, and observations on the titer of blood Wasser manns, or other serum tests. However, when one seeks information on the effects of treatment upon late syphilis, these guides are not available. In the case of latent syplulis since a serum Wasscrmann reversal is an inconstant phenomenon and there are no local lesions which one may observe, the only basis for judging the officacy of treatment is by following patients over a period of many years to see whether they develop any serious late complication of the disease.

It is desirable to compare patients observed for years and treated with various treatment sched ules with patients who have not received treatment to determine the ultimate benefits and the proper amount of treatment to employ One can observe in benign late syphilis, such as mucocu taneous gummata, osseous gummata, or visceral gummata, the healing of the local lesions, but this phenomenon is no criterion of cure nor an indication that more serious late complications such as a cardiovascular syphilis, will not develop the case of cardiovascular syphilis one can deter mine with some degree of accuracy, whether in the instance of simple nortitis, treatment prevents more serious complications such as aneurysm or aortic maufficiency, but when frank saccular aneurysm or nortic insufficiency has developed it is difficult to determine how much benefit is derived from specific antisyphilitic treatment.

There have been relatively few studies done upon the outcome of untreated early or latent syphilis and ultimate outcome of treated latent syphilis. The studies done on treated latent syphilis have all been on the effects of arsenical and heavy metal therapy, since the antibiotic treatment of syphilis is of such recent date that

enough time has not elapsed to determine definitely its value in the treatment of late syphilis other than neurosyphilis. Observations to date on the effects of antibiotics have been on their results in the healing of benign late syphilis. In spite of the inadequacies of long term studies on late syphilis we will attempt to present the known facts regarding proper treatment of the various phases of late acquired syphilis other than neurosyphilis

#### Latent Syphilis

By the term latent syphilis we mean syphilis in which there is neither symptoms nor physical signs of the disease other than positive serum tests. We exclude from the category of latent syphilis those patients in whom the spinal fluid examination is positive. This group we classify as asymptomatic neurosyphilis, and they will not be considered in this presentation

Recently we have studied and published data on a group of patients with latent syphilis who had been observed for a period of ten years or more 1 These patients were divided into two groups 100 patients received forty or more injections of an antisyphilitic drug and 69 received less than this amount. Those who received forty or more treatments were considered as hav ing been treated adequately They were com pared with the group that received less than forty injections of an antisyphilitic drug. The 100 nationts who received forty or more injections were divided into subgroups to determine the effects of varying amount of arsenical drugs and bismuth compounds on the ultimate clinical and serologic outcome From this study we were able to determine, with some degree of accuracy, the ultimate outcome of untreated or poorly treated latent syphilis and the effectiveness of varying amounts of treatment in the prevention of late serious complications of syphilis. The study demonstrated that in both treated and untreated latent syphilis there was a decided tendency of blood serum tests to fluctuate over a period of years. It also demonstrated that treatment had only slight effect upon the blood serum It was shown that in the case of properly treated latent syphilis the blood tests were of no progonatic value. Those patients in whom the blood remained positive following treatment did as well chincally as those in whom the blood be-

Presented at the Idiat Annual Meeting of the Madical Bockety of the State of New York, Buffalo Section on Der matelogy and Syphilology Panel Discussion on Syphilis Friday May 9 1947

came negative This study indicated clearly that in latent syphilis one should not continue to treat patients because blood tests are positive

We were able to show that arsenical drugs were more important in the prevention of late cardiovascular syphilis than were bismuth compounds, and that the optimum amount of treatment consisted of twenty to twenty-nine injections of an arsenical compound in combination with approximately forty injections of a heavy metal treatment than this amount did not improve either the clinical or serologic outcome. It was found that in patients who received this amount of treatment or more, only 1 9 per cent developed a serious late complication. Of the patients who received little or no treatment, 20 to 25 per cent developed a serious, late cardiovascular complica-There were also other less serious complications This demonstrates the effectiveness of proper treatment in the prevention of cardiovascular syphilis

Our studies, in general, agree with those of Diseker, Clark, and Moore,2 who observed 926 cases of latent syphilis for five years or more These authors believe that even less than the above treatment is adequate. In view of our findings, we, at the present time, recommend that patients with latent syphilis be treated with conventional doses of bismuth and arsenical com-These are to be given in courses of approximately ten weekly injections of an insoluble bismuth compound and eight weekly injections of an arsenical compound Approximately four such courses should be given Rest periods of two months may be permitted between courses, since short rest intervals appeared to have no effect upon the ultimate clinical outcome this amount of treatment has been given, no further treatment should be administered, regardless of the serum outcome Patients should then be examined at six- to twelve-month intervals for years, and special attention given to the cardiovascular system

We hesitate to speak of cure in latent syphilis, but, as far as we know, most of our adequately treated patients were cured in a chinical sense, masmuch as no signs or symptoms of syphilis, other than a positive blood test, presented themselves in a period of more than ten years. It may be that adequate treatment completely cures most latent syphilis and the persistence of a positive blood test is of no more significance than a positive Widal test following recovery from typhoid fever. We are unable to present any useful data on the effects of penicillin on latent syphilis. Stokes et al., while treating benign late syphilis with penicillin, found some improvement in the reagin titer in 50 to 60 per cent of 96 late.

cases <sup>3</sup> Ten per cent of their patients developed completely negative blood tests. This does not, however, give any indication as to the ultimate clinical outcome of these patients since they were not followed long enough. Data on the ultimate clinical outcome of patients treated with varying amounts of penicillin will not be available for many years.

## Benign Late Syphilis

In the authors' experience, the treatment of spinal fluid negative benign late syphilis with arsenicals and bismuth compounds produces as good a result as previously described under latent We could not determine from our observation on such patients that mucocutaneous or osseous syphilis predisposed to cardiovascular syphilis We believe benign late syphilis should be treated much the same as late latent syphils. There is some controversy as to whether arsencals should be employed in the treatment of gummatous syphilis of the liver It has been our practice to rely mostly upon iodides and bismuth in treating such patients Hahn,4 however, recently has presented data on 25 patients with gummatous syphilis of the liver and states that there is no evidence that hepatic damage due to syphilis predisposes to hepatic damage due to arsenicals He warns that the use of arsemcals in syphilis at the hilum of the liver might possibly give rise to a therapeutic parado, and thus produce portal thrombosis He believes that the presence of ascites contraindicates arsenical therapy

Stokes et al have recently reported upon the action of penicillin on lesions of benign late syphilis. These authors report that gummatous manifestations of skin, mucosa, and bones yield with striking rapidity in most instances and Tucker reported equally good results in producing the resolution of cutaneous, mucosal, and osseous gummata, and reported that hepatic gummata also respond well 5 They recommended a dose of at least two million units None of these penicillin-treated patients have been followed for a long period of time, so it is impossible to predict whether the penicillin given in treatment of late gummatous syphilis will prevent the development of cardiovascular syphilis at a later date know that small amounts of arsenical and bismuth drugs will produce rapid healing of late gummatous syphilis, but that the amount of treatment necessary to produce such healing is not adequate to prevent the development of other serious complications at a later date fore, do not at this time recommend the simple penicillin treatment of late benign syphilis feel that if this substance is used, the patient should also be given adequate treatment with arsenical and bismuth compounds

Olansky recently has reported Jarusch Herx heimer reactions from relatively small doses of penicillin. It has been noted repeatedly that in early syphilis at least 50 per cent of patients have reactions varying from mild to those with fover as high as 105 F. Olansky noted that as little as one thousand units of penicillin per injection could produce severe reactions in late syphilis. He concluded that ponicillin in any dose may give reactions and recommended that any patient with late syphilis who is to be given penicillin therapy receive bismuth therapy first. We are in accord with the observations of Olansky.

#### Cardiovascular Syphilis

We recently have gathered data on 177 cases of cardiovascular syphilis to determine how many had received adequate treatment either during the early stages of their syphilis or during the latent period. We were also interested in determining the effect of treatment on well-advanced cases of syphilitic aortitis, where the physical and x-ruy findings left little doubt as to the diagnosis. We are aware that many of the cases of latent syphilis, which were included in our previous study, were actually mild cases of syphilitic aortitis which are not diagnosable either by physical or x ray findings.

We believe that we have demonstrated that the proper treatment of these mild cases usually prevents development of nortic insufficiency or saccular ancuryam. This previous study did not include diagnosed syphilitic nortitis and in this study we wished to determine whether treatment of advanced nortifis prevents further progression. We were also interested in the race and sex incidence of the various forms of severe cardiovascular syphilis and the duration of the syphilis before cardiac involvement was demonstrable.

We divided out 177 cases into two groups, depending upon the type of aortic involvement Group I, consisting of 64 patients, had simple syphilitic aortitis The diagnosis was made upon physical and x ray findings Group II consisted of 113 cases of aortic insufficiency and saccular ancurysm. Thirty of the patients had both

#### Syphilitic Aortius

The average age group of the 64 patients was 46.8 years. There were 19 of the patients who knew when they had acquired syphilis, and the average duration from the early phases of the disease until a diagnosis of syphilitic aortitis was made was 21 7 years. Only 4 of the patients gave a history of having had forty or more injections of an antisyphilitic drug during the early or

latent phases of the disease. None of them had had as much treatment as we recommended previously for routine use in latent syphilis Eleven others had sporadic treatment, the average amount being four injections of an arsenical drug and four injections of a heavy metal. The other 40 patients had received no treatment during the early or latent stages of the disease Fifty-six of the 64 patients were under our observation for longer than one year These 56 were observed an average of 54 years. During this period 16 of them progressed from simple syphilitic aortitis to either aortic insufficiency or aneurysm The other 48 patients still had syphilitic acrtitis at the time of the last examination. The 16 patients who developed nortic insufficiency or aneurysm received little or no treatment during the period when they had frank syphilitic acrtitis average amount of treatment these patients received was 7.7 injections of a heavy metal and one injection of an arsenical drug Most of the other 48 patients were under antisyphilitic treatment for much of the period of observation believe, therefore, that proper anthryphilitic treatment of diagnosable syphilitic acrtitis prevents or slows down development of aortic insufficiency and ancurysm

#### Aortic Insufficiency and Saccular Aneurysm

There were 113 patients who had acrue insufficiency, succular angurysm, or both patients were observed for an average of about 29 years. There was considerable variation Several were observed ten years or more We were unable from our data to determine definitely what effect, if any, specific antisyphilitic treatment had upon prolonging the life of these It is our feeling that those who were patients diagnosed early and received treatment did better than those who were not treated. We do not believe that antisyphilitic treatment had much effect upon those who were diagnosed late in the course of their cardiac disease. We feel that advanced aneurysm of the aorta or aortic in sufficiency with decompensation is a problem for the internist rather than for the syphilologist

Many of these patients are still alive and under treatment. The average age of this group was 49 7 years. There were 48 patients in the group of 113 who knew when they had acquired syphilis, and the average time from the early phases of the disease until a diagnosis of severe cardiovascular syphilis was made was 21.8 years. Only 3 patients of the entire 113 gave a history of having had forty or more injections of an antisyphilitid drug Twenty others had some previous antisyphilitic treatment, the average amount was 4.5 injections of an arsenical drug and 7.8 injections of a heavy metal.

There was a decided preponderance of late, serious cardiovascular syphilis among negro men This was particularly true in saccular aneurysm Cardiovascular syphilis was next most common in white men and least common in white women It is our belief that hard manual labor, as performed by many of our negro patients, predisposes them to severe forms of cardiovascular syphilis and, therefore, we feel that patients who have syphilitic aortitis should not perform hard manual labor

## Comment on the 177 Cases of Cardiovascular Syphilis

We were unable to determine accurately what effect antisyphilitic treatment had upon prolonging the life of our patients with saccular aneurysm Our studies indicate, and aortic insufficiency however, that treatment of uncomplicated syphilitic aortitis often does prevent development of the more serious cardiovascular complications Padget and Moore state that antisyphilitic treatment of patients with saccular aneurysm and aortic insufficiency prolongs their life At best, though, such treatment adds only one to two years to life expectancy It is evident, therefore, that patients with syphilis should receive treatment before cardiac involvement is demonstrable We and other authors have shown that in most instances severe forms of cardiovascular syphilis may be prevented either by the proper treatment of early or latent syphilis None of our patients with cardiovascular syphilis had proper treatment during the early or latent period of their disease

We believe that simple syphilitic acrtitis should be treated much the same as latent syphilis. but that the treatment should be prolonged over a period of years We are unable to give the exact optimum amount of treatment but believe steady treatment should be given for at least two years followed by one course of treatment yearly for a total of five years Patients who are then symptom free should be kept under observation Once aortic insufficiency or aneurysm has developed, specific antisyphilitic treatment must be used cautiously Treatment should consist of alternating courses, started with heavy metals weekly for eight toten weeks in full doses, followed by arsenical drugs in one half to two thirds of the Because of the danger from reacusual dose tions, the best arsenical drug to employ at the present time appears to be mapharsen. There are fewer reactions which might be damaging to a cardiac patient with this drug than with the other arsenicals

No regular schedule of treatment can be given as this varies with each individual patient

depends upon their cardiac reserve and how well they tolerate treatment During periods of decompensation they should not be treated with antisyphilitic drugs but should be treated as are other types of decompensated heart disease Nothing is known at the present time of the value of antibiotics in the treatment of cardiovascular Jausch-Herzheimer reactions syphilis been reported in patients with caridovascular syphilis receiving penicillin treatment. If this substance is to be used, patients should be prepared adequately with heavy metals beforehand

## Summary and Conclusions

- Serum tests for syphilis cannot be used as a guide in the treatment of latent syphilis patients whose tests remain positive following treatment do as well clinically as those whose tests become negative
- Proper arsenical and bismuth therapy of latent syphilis usually prevents serious, late complications
- Arsenical drugs are more effective in the treatment of latent syphilis than heavy metal compounds
- Optimum treatment consists of twenty to twenty-nine injections of an arsenical compound and about forty injections of a bismuth compound
- 5 Benign late syphilis should receive the same treatment as latent syphilis
- Proper bismuth and arsenical therapy of syphilitic acrtitis prevents or slows down the development of aortic insufficiency or aneurysm
- Bismuth and arsenical treatment may prolong, somewhat, the life of patients with aortic insufficiency and aneurysm
- Patients who have late syphilitic cardiac disease seldom have had adequate antisyphilitic treatment during the early or latent period
- Among patients with syphilis, late syphilitic cardiac disease is most common in the negro man, next most common in the white man, and least common in the white woman

#### TREATMENT OF NEUROSYPHILIS\*

BERNHARD DATTNER, M D New York City

(From the Department of Dermatology and Syphilology and the Department of Neurology New York University College of Medicine and the Department of Dermatology and Syphilology Third Medical Division (New York University) Bellevie Hospital)

IT IS obvious that the primary goal in treating an infectious disease must be the destruction or arrest of the invading micro-organism in the shortest period of time without injury to the pa tient. In addition, one would like to reverse the clinical manifestations which have occurred in the course of the disease. But this is not always possible because frequently the pathologic process has been so destructive that restitutio ad intearum is impossible. In such cases terminating an infection cannot in itself restore function Let most authors who report therapeutic results in neurosyphilis use, as the standard of success. the clinical improvement of the patient without realising that clinical manifestations may possist although the inflammatory syphilitic process has been arrested That the activity of the infection and the clinical manifestations of the disease do not run parallel is shown in cases of asymptomatic neurosyphilis where the infection may be very active and continue for many years without mani festing itself in neurologic signs or symptoms Finally, clinical improvement of the patient may be only transitory and not indicative of the total arrest of the process.

All these facts emphasize the need for more objective criteria for the success or failure of treatment than a reliance on clinical manifesta tions alone

What then should be the standard for deter mining the effectiveness of our therapeutic measures? For more than twenty years we have demonstrated and stressed that the spinal fluid findings are the only reliable guides as to the activity and character of the infectious or degenerative process. However this holds true only if the spinal fluid examination comprises the cell count, total protein determination, colloidal gold and complement fixation test, and if all the tests are considered as a whole. Furthermore, all these tests must be quantitatively standardized so as to give accurate and reproducible results.

What are the criteria of activity of the syphili tic process as mirrored in the spinal fluid findings? Based on our past experience in the follow-up of parctic patients who were successfully treated

of paretic patients who were successfully treater

Presented at the 141st Annual Meeting of the Medice
Bodely of the State of New York, Buffalo, Section on De-

Presented at the 141st Annual Meeting of the Medical Society of the State of New York, Buffalo Section on Der matclory and Syphilology Fanci Discussion on Syphilis, Friday, May 1647.

\* Alded by grants from the Office of Scientific Research and Development and the United States Public Health Service. by malaria therapy as demonstrated by their survival for more than fifteen years, we have emphasized that the cell count is the most important aid in determining the activity of a syphilitic process in the central nervous system. As a rule lymphocytosis is the first abnormality to disappear in the spinal fluid after successful treatment as it is the first to appear after infection of the central nervous system. The increase in protein, abnormal colloidal curves and specific tests for syphilis may persist for longer periods, even though the pathologic process has been arrested

Because of such discrepancies between the rapid drop to normal of the cell count in successfully treated patients as compared with the gradual decline or fluctuating values obtained in the other tests confusion has anson in the literature with regard to the effectiveness of treatment as reflected in the spinal fluid syndrome

Within the past few years, however, through the initiative of the New York State Department of Health laboratory (Dr. Maillard in charge of the New York Branch) quantitative complement fixation tests and quantitative colloidal gold tests have become available. With the ald of these new quantitative tests it becomes apparent that there is a strict parallelism between the activity of the process and all the spinal fluid tests.

As an illustration we present two case histories Case 1 -The patient was a 26-year-old negro woman whose first knowledge of syphilis dated back to 1942 when a positive Wassermann reaction of the serum was found by a local medical doctor. She was given 80 neoarsphenamine, 34 mapharsen and 2 bismuth injections until March 1944. A positive spinal fluid syndrome for syphilis of the central ner your system was found in the Bellevue Outpatient Department on April 17 1944 A recheck of the spinal fluid findings on May 16 1944 revealed identical results. No neurologic abnormalities were present and the patient therefore was classified as having asymptomatic neurosyphilis. The patient was given 2 000 000 units of penicillin 20 000 units every three hours for 100 doses. At the end of treatment the cell count protein values and colloi dal gold test showed a slight drop Six months after treatment the cell count total protein and col-loidal gold tests were normal. However a recheck six months later showed abnormal values for these tests, and one month later the abnormalities were still more pronounced Therefore the patient was retreated with 8 000 000 units of penicillin 50 000 units every three hours, for 160 doses Since then

<sup>\*</sup> Titered in units

all the tests, including, the quantitative complement fixation test, have been constantly improving Table 1)

It should be noticed that the reversal of the spinal fluid findings indicating renewed activity of the process occurred more than six months after termin-This would indicate that a ation of treatment waiting period of more than six months is required to evaluate the arrest of the process by tests of the spinal fluid In the follow-up of malaria-treated patients we found that only about 4 per cent of the patients had a similar relapse more than six months after treatment. So far, the same rate seems to prevail in our penicillin-treated patients

Case 2 — A 36-year-old patient with general paresis had deteriorated markedly over a period of several months before admission He was first subjected to malaria treatment. Spontaneous arrest of fever occurred after the seventh bout of fever and. therefore, the patient, was given three intravenous typhoid vaccine injections with satisfactory febrile He then received ten daily injections of

mapharsen, 006 Gm each. The spinal fluid syndrome showed signs of activity one year after termination of this treatment and the clinical status of the patient had only moderately improved Quartan malaria with nine fever bouts, followed by ten daily injections of mapharsen, 0 06 Gm., resulted in a slight improvement of the spinal fluid findings then subjected to a course of forty intramuscular injections of a pentavalent arsenical (Solvarsin) spite of this, the spinal fluid examination indicated persistence of an active syphilitic process and the patient, therefore, was given 9,000,000 units of pencillin, 40,000 units every three hours for 225 doses Since then all tests of the spinal fluid show a marked decrease which has now continued for two years He has had a normal cell count since March, 1945, but clinically he has never attained his preparetic level (See Table 2)

It would be desirable to report on the therapeutic results which were obtained by various methods of treatment of neurosyphilis

ever, I will limit my comments to the effect of pencillin in neurosyphilis. For the purpose of comparison I will give the figures reported by me with Drs Thomas and Wexler in a previous paper on the rapid treatment of neurosyphilis with malaria and chemotherap. With this type of treatment the percentage of success in all types of neurosyphilis varied from 74.2 to 88 5 per cent the average being 85 9 per cent. In this series there were 298 patients who were followed-up from six to forty-seven months

How do these figures compare with results ob-

tained with penicillin therapy?

At Bellevue Hospital, we have treated 250 patients having neurosyphilis with penicillia alone, using penicillin dissolved in water, given intramuscularly every three hours. The total desage of penicillin used in these cases varied from 2,000 000 to 9 000 000 units, given in dosages varying from 30 000 to 40,000 units per in jection every three hours (Table 3) riod of treatment varied from nine to twentyeight days The spinal fluid was examined before treatment and every three months after treatment for the first year, then every ax months thereafter The longest period of observation was thirty-six months (Table 4) to be expected, the largest percentage of relapses following treatment occurred among those who received less than 5 000 000 units.

Of the 250 patients treated, only 226 completed their treatment more than six months ago and 33 have been lost from further observation, so that only 193 have been followed up for more than six months, 135 of these have been followed for a year or more and 73 for two or more years.

Of the 103 patients followed up for more than six months (Table 5) 85 per cent now have an inactive spinal fluid which compares favorably with the figures given for a similar group of patients treated by combined malaria and chemotherapy

I have not attempted to evaluate the results of

treatment by describing the clinical response. Many of the patients had marked clinical improvement So far as we can determine this differed in no respect from that following malaria therapy But I wish again to emphasize that we treat syphilis for the purpose of eradicating the infection. If this is accomplished function of damaged nervous tissue may or may not improve according to the localization of the process and degree and extent of the damage. Thus for any scientific evaluation of treatment we must discover to the best of our ability, whether or not we have arrested or destroyed the invading organisms. If at the same time there has been an im provement of function we, as well as the patient can rejoice, but this alone does not afford as ob-

### THE SEROLOGIC TESTS IN PENICILLIN-TREATED SYPHILIS

CHARLES R REIN, MD, New York City

(From the Skin and Cancer Unit of the New York Post-Graduate Medical School and Hospital, Columbia University, and the Division of Scrology, Army Medical Center, Washington, D(C)

PRACTICING physicians frequently are faced with the problem of how to evaluate or interpret serologic reports obtained from the laboratory in determining the presence or absence of a syphilitic infection. They are often disappointed when serologic tests remain positive for several months following penicillin therapy. There are, however, several factors which influence the length of time required to attain seronegativity.

### Factors in Seronegativity

1 Stage of Disease—The older the disease the longer spirochetes have been present and the longer it takes for the body cells to stop forming reagin. As a rule, patients with secondary syphilis require more time to acquire seronegativity than patients with seropositive primary lesions.

2 Immunologic Response of Individual Patients—Some patients with syphilis develop more antibodies or reagin than do others after the same type of stimulus. The former patients usually require more time to attain seronegativity.

3 Serologic Titer—As a rule, patients with high serologic titers at the onset of therapy may require more time to attain seronegativity than those with relatively low titers

4 Sensitivity of the Serologic Procedure—The more sensitive the serologic test the longer it will take to attain seronegativity. When a serologic battery consisting of tests with varying sensitivities is employed, negative reactions may be obtained with less sensitive tests long before the more sensitive tests become negative

6 Type of Test—Certain types of tests may remain positive long after other tests have become negative, even though they may be in the same relative range of sensitivity

6 Treatment Schedule—The amount of pencilin, the type of pencilin, and the length of time required to administer that amount of treatment may also affect the length of time to attain seronegativity. As a rule, the higher the total dosage of pencillin, the greater the percentage of the "G" friction and the longer the period of time during which the treatment is administered, the shorter the time required to attain seronegativity

Presented at the 141st Annual Meeting of the Medical Boolety of the State of New York Buffalo, Section on Dermatology and Syphilology, Panel Discussion on Syphilis Friday, May 9, 1947

It must be pointed out, however, that there are many variations to the above factors and no set rules can be made to determine or anticipate the length of time required to attain seronegativity Thomas believes that patients who continue to have persistent, strongly positive serologic reactions nine months after rapid therapy should be retreated as a precautionary measure 1. He emphasized the fact that one should not expect rapid reductions in serologic titers in such patients after retreatment It has been observed that some patients may remain seropositive, particularly when treatment is started during the stage of secondary syphilis, for as long as two years before reversal to seronegativity If retreatment is instituted within the first year and that patient subsequently becomes seronegative, the clinician is at a loss to know whether that reversal is due to the additional treatment or whether he would have become negative if the retreatment had been withheld Certainly such patients should not be classified as "treatment failures" in evaluating the efficacy of penicillin in the treatment of syphilis

## Serologic Differentiation Between Relapse and Reinfection

With the introduction of various forms of rapid treatment for early syphilis, particularly penicillin therapy, many more patients are attaining serologic and clinical cures earlier than hereto-Such patients are candidates for reinfections and it is not an infrequent occurrence to find patients reinfected with their own spirochetes This type of reinfection was very aptly called "ping-pong" syphilis The individual acquires syphilis extramaritally and, after the development of the primary lesion, infects his marital He receives adequate penicillin therapy and may attain a rapid clinical and serologic cure During this time his wife has been incubating the spirochetes and reinfects him with his own spirochetes on subsequent sexual exposure

The onterna for indisputable reinfection are quite rigid and, unfortunately, the patients are not observed at sufficiently frequent intervals to satisfy all of these requirements. It is, therefore, often quite difficult to determine whether the patient has developed a new infection or if there has been a relapse of the old infection.

At the Army Medical School we have had considerable experience with the serologic follow-up

of patients with penicillin treated early syphilis A battery of serologic tests was performed with serums of such patients at daily, weekly, and monthly intervals. From our observations we feel it is possible to distinguish between relapse and reinfection by carefully conducted quantitative serologic studies at frequent intervals Following peniculun therapy in patients with early syphilis, there is usually a progressive reduction in serologic titer. In reinfection the patient usually attained and maintained complete seronegativity followed by the development of a dark field positive, seronegative lesion at a new site. Shortly afterwards such patients developed seropositive reactions with rapidly increasing In treatment failures or relapso there was noted a sudden increase in serologic titer followed in about one month by clinical evidence of a mucocutaneous relapse in the majority of in stances. If penicillin-treated patients would be subjected to serologic examinations at weekly or monthly intervals, it might be possible to predict a clinical relanse about one month before there is any clinical evidence, by a progressive increase in scrologic titer on repeated examinations

It is of utmost importance therefore to edu cate patients of the great need of reporting to physicians for serologic and clinical examinations at regular monthly intervals for at least one year following the completion of penicillin therapy

Many patients who are classified as clinical relapses are most likely reinfections. It is not fair to consider such cases as treatment failures when the majority of them may actually be reinfections. For every reinfection classified as relapse there is a reduction of 2 per cent in the 'cure rate' in Indicating the efficacy of that particular treatment schedule

### Penicillin Therapy in Concomitantly Acquired Gonorthea and Syphilis

With the introduction of penicillin the phy sician now has at his disposal a therapeutic agent which is efficacious in the treatment of gonorrhea and syphilis When penicillin was adopted by the Armed Forces as the standard treatment for gonorrheal infections it was anticipated that a concomitantly acquired syphilitic infection would be masked by the penicillin and many reports of this type have appeared in the literature most instances the patient acquired syphilis con comitantly with the gonorrheal infection iscuous patients however, may acquire syphilis immediately prior to or soon after becoming in feeted with generation. The amount of peni cillin (usually 200 000 to 400 000 units) which is adequate for the cure of gonorrhea is definitely inadequate for the concomitant avphilitie in-

fection In such patients the following may occur

(a) Abort.—If the patient received penicillin very early in the course of the gonorrheal infection and the syphilis is only of a few days durition, that relatively small amount of penicillin may be sufficient to abort or cure the syphilitic infection. This has been corroborated by animal experiments where small amounts of penicillin administered a few days after infection were sufficient to affect a cure

(b) Mask—If the concomitant syphilitic infection is a few days older, the same amount of penicillin may prevent the appearance of the primary or secondary lessons. In such instances the only evidence of a syphilitic infection is the development of positive serologic tests for syphilis several weeks or months following treatment of the genorrheal infection.

(c) Delay—In still older infections the penicillin therapy will tend to delay the appearance of the early cutaneous manifestations for several months after the disease has been acquired

Some investigators 1, 1 have observed the oc currence of chills, fever, and malaise developing early in the course of penicillin therapy for gonorrheal patients who also have a syphilitic infection. They believe these symptoms indicate a Hery helmer reaction due to the rapid destruction of the spirochetes, the incidence and severity of the reactions depending upon the extent of the spirochetal invasion It has been suggested that the following be done whenever penicillin therapy is instituted for gonorrheal infections (1) thorough examination for any clinical evidence of syphilis and the performance of a serologic test prior to the administration of therapy, (2) observations should be made for the occurrence of chills, fever and malaise accompanying penicillin therapy (3) repeated clinical and serologic rechecks at monthly intervals for six months following ther-If at any time during this period there is any clinical or serologic evidence of syphilis additional adequate penicillin therapy should be administered

It has been estimated that approximately 75-000 soldiers were separated from the United States Army with positive serologic tests for syphilis. Many of them presented no clinical or anamiestic evidence of syphilis. They did how over receive penicillin therapy for an acute gonor rheal infection at some time during the preceding several months. It is quite possible that they may have acquired a concomitant syphilitic infection and the relatively small amount of penicillin (200 000 to 400 000 units) served to mask or abort the appearance of the early syphilitic lesions. It is suggested therefore that patients

who develop positive serologic tests following penicillin therapy for gonorrhea be considered as having acquired a concomitant syphilitic infection, and that additional antisyphilitic therapy be instituted

### Conclusions

Carefully conducted quantitative serologic examinations are of definite value in the control of follow-up of penicillin-treated syphilis

As a guide of response to treatment

- As a means of differentiating between serologic relapse and reinfection
- In predicting an impending clinical relapse
- As a means of detecting masked syphilis following a concomitantly treated gonorrheal infection

### VETERANS CONVALESCENT HOSPITAL

New York State has established, at Mt Mc-Gregor, one of the finest and most modern institutions for convalescent care of its veterans. All patients are under medical supervision at all times Physical medicine is practiced to further the purpose of restoring the veteran to an employable state of health, or to as close an approach to normal heath as may be attained. To this end, a modern Occupational Therapy Department is maintained, and also physiotherapy facilities are available, consisting of whirlpool bath, short-wave diathermy, ultraviolet lamps, infra red, and bakers Prescriptions for outdoor exercise are carried out carefully and supervised by a competent athletic instructor equipment necessary for diagnostic work is an allable for use of the physician, including x-ray, fluoroscopy unit, electrocardiograph, basal metabolism apparatus, and other usual aids. The medical staff consists of two physicians, five nurses, one physic-therapist, one occupational therapist, and an 1-ray and laboratory technician

The property consists of approximately 1,600 acres, of which 1,200 acres are mostly forest land, with many pleasant trails for use of the patients Nine modern, fire resistant buildings are used for housing the patients, providing accommodations for 650 to 700 patients during the summer months, and 450 patients during the winter Administration building, theater, refectory, chapel, occupational therapy, power house, two dormitory buildings for employees, and residences for eleven families complete the main group of buildings The farm of 400 acres supplies milk and cream from its herd of registered Ayreshires, and eggs, poultry, pork,

and fresh vegetables This entire service is provided at no cost to the

veteran, including transportation to and from his home, and lodging, meals, laundry, and the use of all facilities and equipment

Veterans' Counselor or the Director of the County

Veterans' Service Agency Admittance is obtained by contacting a State

### ALLERGY CONVENTION IN DECEMBER

The American Academy of Allergy will hold its annual convention at Hotel Jefferson, St Louis, Missouri, December 15 to 17, inclusive All physical Al cians interested in allergic problems are cordially invited to attend the sessions as guests of the Academy by registering without payment of fee The program and the scientific and technical exhibits have been arranged to cover a wide variety of conditions where allergic factors may be important Round table conferences will be held on Monday afternoon, December 15, 1947 Advance copies of the program may be obtained by writing to the Charles of American Charles H. Evergence Chairman on Arrangements, Charles H Eyermann, M D, 634 North Grand Boulevard, St Louis, Missouri

### THREE BEST ESSAYS IN THE NATION

The Association of American Physicians and Surgeons, in cooperation with State and County Medical Societies, announces the winners of the annual National Essay Contest for Junior and Senior High School Students for 1947

The three best essays on the subject "Why the Private Practice of Medicine Furnishes This Country with the Finest Medical Care" were written by Miss Jean Downhour, Benchland, Montana, who won the first prize, \$1,000, second prize was awarded to Richard Brandow, Bradford, Pennsylvania, \$500, and the third prize of \$100 went to Miss Bettye

Eccles, Gulfport, Mississippi Honorable mention and \$25 cach was awarded to Naw York, Miss Jean Ritchie, Saratoga Springs, New York, Miss Louise Bekman, Ottumwa, Iowa, and Richard

Renner, Mansfield, Illinois.

## THE VALUE OF SYMPTOMS AND PHYSICAL SIGNS IN THE DIFFERENTIAL DIAGNOSIS OF JAUNDICE

WILLIAM F LIPP, MD, ALFRED R. LENZNER, MD, and AH AARON, MD Buffalo New York

J AUNDICE is a frequent sign of pancreobiliary tract disease. It is essential that the nature and location of the lesion producing the jaundice be recognized if proper treatment is to be instituted. In the light of recent progress in the field of liver physiology with consequent advances in (1) the medical (dietary) treatment of liver disease, (2) preoperative and postoperative care in biliary tract surgery, and (3) the surgical management of malignant disease involving the pancreas and duodenum, the need for accurate diagnosis becomes even more evident.

For clinical purposes, jaundice occurring as a result of lesions in the pancreobiliary tract may be divided on an anatomic basis into intrahepatic and extrahepatic jaundice (known by various terms such as hepatocellular jaundice, parenchymal jaundice, etc.) includes infectious hepatitus, the cirrhoses, and the dystrophies, the management of this group of diseases usually is medical Extrahepatic jaundice, commonly called obstructive jaundice, includes such lesions as common duct stone, carcinoma, and stricture, as a rule, the treatment is surgical.

The differential diagnosis between intrahepatic and extrahepatic jaundice continues to represent a problem in a small but definite group of cases in spite of increasing knowledge of biliary tract physiology Most of the errors in diagnosis occur in the group of patients of middle and past middle life. In recent years many so-called liver function tests have been introduced for the purpose of aiding in the differential diagnosis of jaundice, as well as to assess the degree of hepatic damage Clinical investigation has demonstrated the shortcomings of these laboratory tests Their usefulness is limited by the com plexity and multiplicity of liver physiology, the extensive reserves of liver tissue, and the capacity of the liver for regeneration. Although certain of these procedures have value in supporting a clinical impression the differential diagnosis of jaundice at the present state of our knowledge remains largely a bedside problem Consequently, it is of value to recognize the symptoms and signs commonly associated with the various types of mundice.

### Material and Method

In an effort to evaluate the degree of accuracy of diagnosis in jaundice in a general hospital. the records of 412 patients admitted to the Buffalo General Hospital during the period 1936 to 1946 with the presenting sign of icterus were The patients were admitted on many services and consequently a number of physicians shared in their management. Thus, it is felt that the results of the study represent a generally fair picture of the management of jaundice at the general hospital level. In each case the causative lesson was within the pancreobiliary tract. patients with so-called hemolytic laundice were excluded from the study In most instances the diagnosis was confirmed through surgical intervention, biopsy, or postmortem examina tion. However, in the majority of cases of infectious hepatitus and in some cases of cirrhosus the diagnoses were necessarily clinical.

In the present portion of the study an attempt is made to determine the relative diagnostic worth of such clinical factors as age, sex, duration and depth of jaundice, pain, chills and fever, history of previous attacks, digestive symptoms, alcohol and other liver poisons, weight loss, splenomegaly, palpable gallbladder, physical characteristics of the liver, ascites, angioma, and color of the stool The distribution of cases is shown in Table 1

The designation billary eardnoms refers to malignant lesions other than neoplasms of the pancress, such as car chroms of the galibladder carrinoms of the bile ducts and metastatic carrinoms.

#### Results

Age.—The distribution according to age is shown in Table 2. Eighty-six point six (80.0) per cent of the patients with hepatitis were under forty years of age and were equally distributed over the second third and fourth decades while 78 per cent of those with dirrhosis were over forty years and were similarly distributed over the fifth sixth, and seventh decades. The cases of dystrophy were scattered through all age groups. Common duct stone was

---

Presented at the Islat Annual Meeting of the Medical Society of the State of New York, Buffalo Section on Gastroenterology and Proctology May 7 1947

\* In all tables figures indicate number of cases

much more frequent in the later decades (86 1 per cent over forty). The great majority (96 8 per cent) of patients with carcinoma of the pancreas were above forty years, while 87 3 per cent were fifty years or older. The cases of carcinoma arising elsewhere in the biliary tract were distributed similarly to those with carcinoma of the pancreas.

When these statistics are examined from the point of view of age rather than the disease, it is found that 75 2 per cent of patients under forty years of age have types of intrahepatic jaundice, and 72 9 per cent of cases over fifty years have forms of extrahepatic jaundice, while from 40 to 50 years the two principal classes of jaundice are about evenly distributed (intrahepatic, 44 5 per cent, extrahepatic, 55 5 per cent)

Thus consideration of the age of the patient has some significance in the differential diagnosis of laundice

TABLE 8 -- Sex

	Men	Women
Hepatitis (60)	30	30
Cirrhosis (91)	59	žž
Dystrophy (24) Calculus (152)	8	16

Carcinoma of pancreas (63)	38	25
Biliary carcinoma (15)	8	7
Stricture (7)	0	7

Sex —The sex incidence is shown in Table 3 As would be expected in infectious disease, there was an equal distribution in hepatitis Cirrhosis showed a predominance of men in the ratio 2 to 1 (men, 64 8 per cent, women, 35 2 per cent) The reverse was true in the cases of dystrophy In common duct stone, women predominated in the ratio 2 to 1 (men, 32 3 per cent, women, 67 7 per cent), while in carcinoma of the pancreas the relationship was reversed, there being 60 3 per cent men and 39 7 per cent women.

Thus, in cirrhosis, common duct stone, and carcinoma of the pancreas a significant sex incidence obtains

Degree —The intensity of jaundice was graded clinically on a 1 to 4 plus scale, as shown in Table 4. This is obviously a gross observation and varies with the examining physician and the interpretation of records. The degree of jaundice generally was considered less in the intrahepatic group, except for the dystrophies, although there were a number of instances of deep jaundice in patients with hepatitis and cirrhosis. In extrahepatic jaundice, the intensity appeared greater when the obstruction was due to a malignant lesion than when it was produced by a common duct stone. Because of rather wide vari-

ations, the degree of clinical interus would appear to have limited value in the individual case

Duration —This factor also is subject to a number of variables —Except for cirrhosis, the duration of intrahepatic jaundice was generally one to two weeks, as shown in Table 5 —This was also true in common duct stone, while in extrahepatic jaundice due to malignancy a longer history (four weeks and more) was present in over half of the cases —Although many factors tend to influence the course of jaundice from onset to time of hospital admission, a longer history would suggest either carcinoma or cirrhosis

Biliary carcinoma (15)	12	1	1	1
Stricture (7)	4	2	1	0

Pain —For the purposes of this study, pain was designated as (1) severe, denoting the biliary colic type of pain, (2) moderate, such as "dull", "aching", and (3) distress. It is well known that pain descriptions will vary from patient to patient, depending on the individual threshold, among other factors. The distribution is shown in Table 6

Pain was a much more prominent symptom in extrahepatic jaundice, particularly in the patients with common duct stone where typical biliary colic occurred in 84.9 per cent of cases Pain of moderate intensity was described by 92 per cent patients, while in 59 per cent there were so-called "silent" stones.

In carcinoma of the pancreas pain of varying degrees was present in 413 per cent of the cases. It was severe, simulating biliary colic, in 79 per cent, in 175 per cent there was moderate pain, in 159 per cent distress alone was described. In 7 cases (269 per cent) with pain there was radiation through to the back, "boring" in nature. Thus, 587 per cent of patients with pancreatic malignancy had so-called "painless jaundice". Of the cases with carcinoma elsewhere in the biliary tract, such as the

gallbladder and bile duets, 70 9 per cent gave no history of pain

Pain, variable in type and degree occurred in 46 5 per cent of patients with hepatitis, 77 per cent of those with cirrhoses, and 16 5 per cent of those with various dystrophies. However in only a few instances did the pain in intrahepatuc jaundice (hepatitis, 5 per cent, dirrhoses 0 per cent dystrophy, 8.3 per cent) resemble the colle of common duct stope.

The presence of pain and its nature constitute a significant clinical aid in the differential diagnosis of laundles

Prerious Attacks—The frequency of previous attacks in the group of choledocholithiasis was strik ing enough for special comment. Seventy-six point nine per cent of patients with extrahepatic jaundice due to common duct stone gave a history of one or more previous attacks of billary colic. Of these, 36.7 per centreported jaundice with one or more of the earlier episodes while 27.3 per cent had had a previous cholecystectomy. This has diagnostic value. The only other billary tract diseases under consideration in which recurrent episodes of jaundice might be expected are the cirrhoses and dystrophies.

TABLE 7 -- CHILLS AND FEVER

	Chills at Onset	Fever
Hepatitis (60)	12	26
Cirrhosis (91)	4	21
Dystrophy (24)	0	7
Calculus (152)	70	63
Carcinoma of pancress (63)	4	9
Biliary eardinoma (15)	ī	5
Stricture (7)	2	3

Chills and Fever—These data are presented in Table 7 Except for the cases of bepatitis, the history of a chill was infrequent in intrahepatic jaundice It occurred at the onset in 20 per cent of the hepatitis group In extrahepatic jaundice chills were associated with 50 per cent of the cases of common ductation, while they were uncommon in maliginant obstruction (6.3 per cent)

Fever at the time of admission was 100 F or more in 43.3 per cent of those with hepatitis 23 per cent with cirrhests, 20 I per cent with dystropty 41 4 per cent with choledocholuthasis 14.3 per cent with carcinoma of the pancreas and 33 3 per cent with malignancy arising elsewhere in the biliary tract.

As would be expected, these manifestations are more likely in the presence of infection and acute tusue destruction. The history of chill suggests common duct stone or infectious is patitis.

Digestive Symptoms.—Anorexia and nausea are usual in all forms of jaundice Emesis occurred in 716 per cent of cases having hepatitis 11 per cent having cirrhosis 417 per cent dystrophy; 57 per per cent common duct stones 22 per cent paneres tic malignancy and 6.7 per cent having carcinoma obsewhere in the billary tract.

Thus emeals in the presence of pain might sug gest common duct atone while emeals with no pain or moderate pain might favor the diagnosis of hepetitis or dystrophy Hepatotoxins.—Fifty-six point ax per cent of the patients with cirrhosis gave an sleoholic history while in those with dystrophy 12 per cent used alcohol to excess and 12 per cent were exposed to other recognized liver poisons

TABLE 8 .- Loss of Wright

	None	5-10 Pounds	10 Pound Plus
Hepatitis (60)	59	1	0
Circhoeds (91)	71	6	14
Dystrophy (24)	19	4	1
Calculus (152)	126	4	23
Carcinoma of pancreas (63)	3	5	55
Biliary carcinoma (15)	1	1	13
Stricture (7)	1	3	4

Weight Loss.—The incidence of loss of weight is shown in Table 8. As would be expected, this was more common in the groups with malignant obstruction. Eighty-seven point three per cent of the patients with carcinoma of the pancreas and 86 6 per cent of those with carcinoma arising elsewhere in the billary tract had lost ten pounds and more However 14 4 per cent of the patients with common duct stone and 15.3 per cent of those with cirrhosis also reported marked loss of weight.

Liser—Except in some of the cases of dystrophies and cirrhoses the liver was almost always increased in size. However the variation was so considerable that this sign appeared to have little value in the differential diagnosis. Nodular livers were more common in the chronic affections such as cirrhosis and carcinomatous involvement. Tenderness occurred more frequently in hepatitis (50 per cent) and common duct stone (75 per cent)

Palpable Spilen.—The spicen was felt in 25 per cent of the patients with hepatitis 516 per cent with carrhests 208 per cent with dystrophy, 19 per cent with choledocholithiasis 31 per cent with pancreatic tumors, and 60 per cent of those with carcinoma arising elsewhere in the billiary tract (Table 9) If the intrahepatic types of jaundice are considered as a group spienomegaly was evident in 38.2 per cent of the cases the spicen was felt in only 2.9 per cent of all cases of extrahepatic jaundice

Consequently, the presence of a palpable spleen is an important finding, indicating an intrahepatic type of jaundice.

TABLE 9 -PHYSICAL SIGNS

	Spleen	Gallbladder	Ascites
Hepatitis (60)	15	0	O
Cirrhoeis (91)	47	0	73
Dystrophy (24)	8	Ó	6
Calculus (152)	3	. 9	.0
Careinoma of panereas (63)	2	27	11
Biliary cardinoma (15)	1	Ī	3
Rivieture (7)	1	0	0

Palpable Gallbladder —The gallbladder could be felt in 42.8 per cent of the patients with carrinoma of the pancreas, according to Courvoisier a law (Table 9) In a much larger portion of the cases of pancreatic carcinoma, the gallbladder was found to be greatly distended at laparotomy An enlarged tender gallbladder was noted in a few instances of common duet stone.

A palpable gallbladder, therefore, is a valuable sign of extrahepatic jaundice, usually indicating the presence of carcinoma of the pancreas

Ascites —Free fluid in the peritoneal cavity was demonstrated in 79 1 per cent of the patients with cirrhosis, 25 per cent of those with dystrophy, 17 4 per cent with pancreatic malignancy, and 20 per cent with carcinoma, arising elsewhere in the biliary tract (Table 9)—It is thus a frequent sign of intrahepatic jaundice, although it may occur during the later stages of malignant disease

Angioma —Angiomas were noted in 35 per cent of the patients with cirrhosis. This incidence is low, undoubtedly because it is only recently that they have been looked for. They represent a sign of intrahepatic disease, particularly cirrhosis.

TABLE 10 -- COLOR OF THE STOOL

	Brown	Light Brown	White
Hepatitis (60)	41	18	1
Cirrhosis (91)	79	12	0
Dystrophy (24)	19	5	0
Calculus (152)	116	27	9
Carcinoma of pancreas (63)	2	22	39
Biliary carcinoma (15)	1	10	4
Stricture (7)	2	Б	0

Color of Stool .- The color of the stool in the various forms of jaundice is shown in Table 10 "White" stools were described in 16 per cent of patients with hepatitis, none in those with dystrophy, 59 per cent of those with common duct stones. 618 per cent of those with carcinoma of the pancreas, and in 266 per cent of cases of malignancy elsewhere in the biliary tract Brown stools occurred in the majority of patients with intrahepatic jaundice, as well as extrahepatic jaundice due to The color of the stool of jaundiced patients measures approximately the degree of obstruction Thus the frequency with which complete obstruction occurs in extrahepatic lesions, particularly carcinoma, and the infrequency with which it occurs in intrahepatic jaundice constitute a valuable clinical ındex

### Summary and Conclusions

The value of the churcal picture in the differential diagnosis of jaundice is reaffirmed by the results of an analysis of the records of 412 patients admitted to the Buffalo General Hospital This observation probably reflects the management of jaundice throughout the country at the general hospital level—the level at which a large section of the population is served In the great majority of cases, careful evaluation of such clinical factors as age, sex, pain, splenomegaly, and ascites, among others, will indicate the site and nature of the lesion producing the naundice In spite of improvement in our understanding of liver physiology with the development and application of many tests of liver function, the diagnosis will at the present state of our knowledge be arrived at through bedside observa-Indeed the more useful laboratory procedures may be employed only to confirm the clinical impression, and they will lose what value they possess unless the results are interpreted by the clinician in the light of the clinical picture

Furthermore, as will be reported in another communication relative to the rate of accuracy of diagnosis in jaundice, there will remain a small group of patients in whom the most intensive study over a period of time will fail to demonstrate satisfactorily the causative lesion and in whom surgical exploration will be necessary to avoid overlooking a remediable extrahepatic lesion such as a silent common duct stone or neoplasm

The diagnosis of pancreobiliary tract lesions producing jaundice is made in the majority of instances through careful appraisal of historical evidence and physical findings

### Discussion

Dr Albert F R. Andresen, Brooklyn, New York.—The authors have done a very fine piece of work in studying 412 cases of jaundice from the records of a general hospital, and in addition to their present study we may anticipate a series of articles on various phases of pancreobiliary tract disease which will be of inestimable value to the clinician

I agree with the authors that the differential diagnosis of jaundice, in spite of the many liver and pancreatic function tests which have been devised, is still largely a bedside problem. Some of our most valuable liver function tests cannot be applied in the presence of jaundice, and the very multiplicity of tests shows that as yet no really conclusive ones are available in any case. It has been pointed out by the authors that this is to be expected because of the many functions of the liver, its reserves of liver tissue, and, particularly, its capacity for regeneration of functioning liver cells

The present study shows how valuable such a gathering of statistics of a large group of proved cases can be It demonstrates the importance of a consideration of age and sex in the differential diagnosis of jaundice as contrasted with the relative uncertainty of the degree and duration of jaundice The severity of the pain in extrahepatic jaundice as contrasted with its comparative mildness or absence in intrahepatic jaundice is an interesting observa-The frequent presence of pain, at times even severe, in pancreatic carcinoma should be emphasized, as should the frequent presence of fever and the relative absence of chills The universal complaint of retrostaltic symptoms with frequent vomiting in all types of jaundice is a well known fact, with this study showing that severe pain with vomiting suggests common duct stone, whereas vomiting with little or no prin favors intrahepatic jaundice

The predominant history of alcoholism in patients with cirrhosis agrees with the experience of all clinicians, although as an etiologic factor it is regularly discounted by pathologists. In connection with the discussion in regard to liver enlargement,

it should be pointed out that clinical notes on charts often will describe enlargement of the liver when operation or necropsy will show a liver of normal or even small size. A diagnosis of splenomegaly is also often a deceiving observation, some clinicians per hans being able to feel spleens better than others The authors also point out how frequently an enlarged galibladder though present, is not felt in the presence of pancreatic carcinoma. Observations in regard to the color of the stool are notoriously bad in general hospital cases and white or clay-colored stools may often be caused by the presence of barrum given for an x-ray study

I agree with the authors in their conservative estimate of the value of laboratory procedures in the differential diagnosis of jaundice in their emphasis of the value of clinical interpretation and in their conclusion that often surgical exploration is desir able in doubtful cases in order that curable or remedi able surgical measures be not neglected

#### TUBERGULOSIS PATIENTS REACT WELL TO PURIFIED STREPTOMYCIN

Four New York doctors report that reactions to highly purified streptomycin on long-continued ad ministration are sufficiently low to justify the use of the drug in the treatment of most forms of tuberculocis.

This investigation was conducted under the di rection of the National Research Council Committee on Chemotherapeutics and Other Agents, by Drs Robert F Farrington, Harnet Hull-Smith Paul A

Bunn, and Walsh McDermott.

Writing in the June 21 issue of the Journal of the American Medical Association the investigators point to four general types of toxic reactions to the drug among 16 tuberculous patients histamine or allergic reaction in which pouon is released by the tissues, characterized by flushing, headache, and an abrupt fall in blood pressure, various forms of ana phylaxis or hypersensitivity to the drug neurologic disturbance with occasional deafness and kidney damage.

However in only two of the 16 patients treated for 120 days, was it necessary to interrupt the ad minustration of the drug and it was possible to re-sume treatment eventually in both of these patients.

'On the basis of the present investigation," write the physicians "it appears that the toxicity of highly purified streptomycin is sufficiently low to justify its long-continued administration to patients with ac-tively progressing tuberculosis and other comparably serious infections. Conversely it appears that streptomycin should not be employed in the treatment of relatively benign [mild] infections such as recently developed minimal tuberculosis or chronic brucellosis [undulant fever], until the question of possible late effects resulting from the use of the drug can be determined.'

### INDIVIDUALIZED TREATMENT NEEDED FOR THYROID PATIENTS TO AVERT CRISIS

Patients with a serious and sometimes fatal condition resulting from overactivity of the thyroid gland called 'thyroid storm by four Boeton doctors, should receive individualized treatment directed toward the correction of all recognizable abnor malities

Writing in the July 5 issue of the Journal of the Writing in the suny o mane of the Journat of the American Medical Association, Drs. Janet W MeArthur Rulon W Rawson, J H Means, and Oliver Cope, from the Thyrold Clinic Massachusetts General Hospital state that of a total 2,033 patients with a poisonous thyroid admitted to the wards of the Massachusetts General Hospital in the past

25 years 30 had experienced a thyroid storm.
Our conception of storm, the doctors say "is essentially that it represents the inability of the patient any longer to adjust to the strain imposed by the hyperthyroldism [overactivity of the thyroid glandi

Sixteen of 25 patients who experienced a thyrold storm following surgery died and eight of 11 patients having thyroid storm following medical treatment died.

The most common complication in these 86 patients was heart disease which was noted in 23 pa-tients. "That these complications exerted a significant, often decisive influence on the survival of the patients is clear "state the authors, for of the 12 survivors, whose sverage age was 48 five had complicating decases, whereas among the 24 deaths, average age 49 19 had complicating diseases.

In the majority of patients the physicians were able to determine a precipitating factor which pro-voked the crass in the medical storms the commonest cause was the withdrawal of iodine and in surgical atorms, the crisis usually followed the removal of the

thyroid.

In conclusion the authors point out that since thyroid crisis occurs in patients with severe poisonous thyroids who are undernourished and suffer from serious complicating diseases and in whom medical treatment has been unsatisfactory the occurrence of crisis can be reduced by not operating on such patients until normal thyroid function has been restored in the patient with antithyroid drugs such as thiouracil.

# REPORT OF AN ITCHING DERMATITIS APPARENTLY DUE TO SCHISTOSOMA CERCARIAE

WILLIAM A HOLLA, MD, and EDWARD A LANE, MD, White Plains, New York

(Commissioner and Director, Division Communicable Diseases, Westchester County Department of Health)

BEGINNING about the latter part of July, bathers at Interlaken Lake in the Town of Eastchester, Westchester County, New York, began to experience an itching eruption that at first was considered to be the result of insect bites The lesions developed, shortly after bathing, as minute red macules or papules which increased in diameter, in some cases remaining more or less flattened and in others becoming slightly raised In the more extensively involved cases the distribution was irregular but more or less general, except for the face and arms Some of the lesions became quite red, appearing almost pur-The fastigium lasted about three days with more or less discomfort due to the itching. after which the eruption tended to subside during the next few days The itching did not respond to the usual local applications One patient, an adult woman with a very extensive involvement. was hospitalized for relief from the intense irrita-Among the children there was evidence of mechanical injury and mild secondary infection with crusting due to scratching Two or three of the patients mentioned some edema about the eves

The lake in question is part of a multiple apartment development, housing about 1,500 people Bathing is restricted to the tenants Formerly a reservoir for the City of New Rochelle, Interlaken Lake, which is shaped like a V, is a little over a mile long and a little less than 1/4 of a mile at the widest part There is an artificial sandy beach about 100 feet long on the outer shore near the center of the V, with a dock extending out into deep water for the swimmers and a fenced-in pen for young children A short distance from the dock on the side opposite the pen are some boats and the resting place of a flock of waterfowl The waterfowl, which consist of some domestic white ducks and a few wild ducks, together with occasional wild geese, have been more numerous this year than formerly As they are fed by the children, they tend to congregate near the same part of the shore in close proximity to the bathing area

In view of the supposed absence of water itch in this part of the country it was at first thought that the itching eruption was probably due to insect bites. It was generally agreed, however, that it did not resemble mosquito bites nor did there appear, on casual inspection, to be any other insects present in sufficient numbers to account for the trouble

In view of the inconclusive nature of the investigation, and having in mind the possibility of a causal connection with the waterfowl, some snails obtained in the area of the bathing beach were submitted for examination to the Department of Preventive Medicine, New York University, College of Medicine Donald V Moore, who conducted the investigation in the laboratory, discovered cercariae in one of the snails which, when placed on his wrist, produced a typical water itch eruption Two of his associates also developed a dermatitis snails, which were sent by Dr Moore to the Museum of Comparative Zoology at Harvard University, were identified by Dr William J Clench, curator of mollusks, as Physa heterostropha Say Dr Moore was unable to find cercarnae in a pail of the lake water obtained at the bathing beach However, one of the white ducks that was sent to him for examination was found to harbor schistosomes which proved to be Trichobilharzia physellae

It appears probable from the foregoing that the bathers at Interlaken Lake were affected by schistosome dermatitis. This in turn evidently resulted from the presence of some infected waterfowl that have been visiting the lake as well as other collections of water in lower Westchester County in increasing numbers in recent years. It is evident that this condition, formerly associated primarily with the Great Lakes region, is now present in this part of the country. With the increasing influx of waterfowl it is probable that water itch will be encountered with greater frequency hereabouts in the future.

### EMBOLIC OCCLUSION OF THE BIFURCATION OF THE ABDOMINAL AORTA

SAMUEL EPSTEIN, M D , F A C P , Brooklyn, New York

(From the medical services of Dr Thomas J Longo Medical Director, Coney Island Hospital)

THE study of thrombo-embolic disease is of the utmost importance today Recent surgical and medical advances in diagnosis and therapy have been remarkable. With the advent of refinements in survical technic and the further development of anticoagulant therapy early recognition of occluave ambolic processes in the larger arterial vessels is imperative

In the past we have seen on our wards classic cases of "rider's embolism in theumatic heart discase with auricular fibrillation. 1 Several have been treated by embolectomy others have been recanalized under medical therapy and with no fur ther embolic processes, have led fairly useful lives

It is our purpose to present the atypical manifestations in which early diagnosis may enable the

institution of early remedial measures.

Up to 1943 when Greenfield reviewed the litera ture 156 cases of thrombosis and embolism of the sorts had been reported.2 He added 5 more cases and Reich \* in 1948 added 10 cases, making a total of 177 reported cases. There is no doubt, however that the incidence is much greater Recovered cases usually are not reported: others (like some of ours) without unusual features are likewise not reported Phillips and Gross point out that atypical cases are frequently overlooked. The classic dramatic onset with sudden, severe pain in both lower extremities followed immediately by objective signs of arterial occlusion offers no difficulty

It is the group of cases with slow onset and apparently gradual occlusion which requires attention We shall present one such case with autopsy find ings and a second case in which early diagnosis was arrived at because of our experience with the first

#### Case Reports

Case 1 -M T, a 40-year-old woman, was admitted on February 17 1944 and died on March 14 1944

Her chief complaint was numbress of both lower extremities of three months' duration coming in transient attacks following emotional stress in-volving both feet legs, knees the lower quarter of both thighs in circular fashion, and the anal region Her legs felt rubbery, the patient felt as though she were losing her legs and was unable to stand or walk. She would, however, do both if she were urged. Her family history was negative except that she was the oldest and favorite child of a family of six siblings. She had always been nervous, irritable and easily aroused to emotional stress. Nine years ago she had an almost complete bilateral cophorectomy She had had rheumatic heart disease since 1921 and auricular fibrillation since 1941

Physical examination on admission revealed a pa tient who apparently, markedly exaggerated her symptoms and demanded sympathy with rewards being offered for such sympathy she did not appear acutely ill. There were evidences of left and right

ventricular hypertrophy Systolic and diastolic murmurs were audible at the apox, the pulmonic second sound was greater than the acrtic second sound The rhythm was totally irregular and the ventricular rate was 96 per minute. The right lower extremity revealed some weakness and a diminished There were no pathologic reflexes. abdominal reflexes were present. No color changes were noted. The numbress in both lower extremities continued, but on February 19 1944 the knes jerks were bilaterally equal and active On February 22 the lower right extremity became cold and painful, and an area of bluish discoloration appeared on the lateral aspect of the right calf. The dorsalis pedis popliteal, and femoral arteries were not palpable on either side Heparmization was immediately instituted. On February 23 the lower right extremity was warmer but the area of bluish discoloration was larger The oscillometric readings were negative at all levels of both lower extremities. The evidences of arterial obstruction in the lower right extremity increased gradually and on Febru ary 26 the patient was accepted for surgery \(\lambda\) ray of the lower extremity on March 4 revealed loss of soft tissue at the apex of the toes and poor detail of the middle phalanges (gangrene of toes) On March 6 a midcalf amputation under refrigeration anesthesia was performed The patient a condition On March 13 signs of condeteriorated gradually solidation were noted at the right lung base, and on March 14 the patient died

The pertinent laboratory findings were tempera ture 100 F to 102 F for three weeks up to the fourth postoperative day and then, 104 F, 105 F and terminally 107 F The blood pressure was 140/90 and the Wassermann test negative. The electrocardiogram on February 23 revealed auricular fibril lation with a ventricular rate of 95 and QRS of 0 08 A chest plate on February 16 revealed an enlarged heart with mitral pathology, and on March 13, pulmonary congection. A blood culture taken on March 3 was negative The blood count on February 24 revealed hemoglobin of 84 per cent red blood count of 40 million white blood count of 21 800 polymorphonuclears 80 per cent lymphocytes 18 per cent and monocytes 2 per cent on March 4, the white blood count was 25 600 with 89 per cent polymorphonuclears 9 per cent lymphocytes and 2 per cent monocytes. Sedimentation rate on February 17 was 2 mm. in five minutes and

on March 6 was 7 mm. in five minutes

Specific gravity of the urine was 1 019 to 1 033 with two plus abumin on three occasions and fine and coarse granular casts. The interus index on February 21 was 11 with van den Bergh direct. negative. Blood glucose on February 17 was 150 mg and urea nitrogen was 17 mg. per 100 cc Bleeding time was from three minutes on February 22 to twenty two minutes on February 25

Therapy was with theelin digitalis papaverine

heparin, and sulfadazine

The clinical diagnoses were rheumatic heart decase enlarged heart, mitral stenesis and insufficency auricular fibrillation, rider's embolus at the aortic bifurcation with gangrene of lower right ex tremity pulmonary infarct of lower right lobe.

The significant postmortem findings were as follows (autopsy by Drs Rudolph and Sherman)

The surface of both lungs revealed many purplish discolored areas which on cut section were square or rectangular in shape, oozed blood on compression, and were sharply demarcated from the surrounding The blood vessels leading to these areas revealed small emboli firmly adherent to the vessel One large infarct, measuring 4 inches by 4 inches by 3 inches, was noted at the right base posteriorly and its supplying artery was plugged by an embolus

The heart weighed 425 Gm No auricular thrombi-ere present The right ventricular wall measured 0.75 cm and the left ventricular wall, 1.5 cm the aper of the left ventricle were three thrombi protruding into the ventricular cavity No thrombi

were noted in the right ventricular cavity

The coronary arteries were normal. The tricuspid leaflets were thickened with fusion of chordae The mitral orifice was greatly narrowed tendineae The mitral valve leaflets were greatly thickened, stiff, and almost rigid. No vegetations were pres-The chordae tendineae were fused and The aortic cusps were thickened and semirigid with some widening of the commissures, but no fresh vegetations were noted

The liver weighed 1,600 Gm The capsule was smooth and glistening, the cut surface was finely

granular with moderate nutmegging

The spleen was small (250 Gm) There were
many pitted surface scars

The lower pole showed a gray-white discoloration which on cut section extended 2 cm into the parenchyma, this section was yellowish white and sharply demarcated from the surrounding beefy-red, trabeculated splenic tissue The left kidney weighed 85 Gm and in the upper

pole showed a deep old scar, fibrous on section, with a thin shell of cortex measuring 2 by 2 by 2 cm. The a thin shell of cortex measuring 2 by 2 by 2 cm right kidney showed six infarcts varying from 1 by 1 cm to 4 by 2 cm in size, they were grayish yellow

The aorta showed minimal atherosclerosis was a "saddle-embolus" extending from the lower portion of the aorta to both iliac and both femoral It extended up into the right renal artery arteries At the bifurcation, it was firmly adherent to the aortic wall

Microscopic study revealed thrombi filling the lumina of arteries leading to the various infarcted regions of the lung The liver showed chronic passive congestion and evidences of fine currhosis (increased intracapillary connective tissue) Some areas showed necross of liver cells due to hemorrhage

with compression atrophy of the cells

The anatomic diagnosis was rheumatic heart disease, mitral stenosis and insufficiency, aortic stenosis and insufficiency, tricuspid valvulitis, multiple thrombi, left ventricle, multiple infarcts of lungs, kidneys, and spleen, saddle-back thromboembolism of the aortic bifurcation, right renal artery thrombosis, chronic passive congestion of liver, and cardiac cirrhosis

Comment —In the present stress of psychosomatic medicine, the original impression by several capable observers was that the environmental background, the psychobiologic status of the patient, the distinct relationship of the symptoms to emotional stress and strain, and the paucity of objective findings warranted a diagnosis of anxiety neurosis subsequent course of events definitely proved that the symptomatology dating back three months had a definite organic basis

Case 2 -R W, a housewife, aged 51, was first admitted to the hospital on October 14, 1945, com planning of severe dyspines and a productive cough She had had scarlet fever at the age of 6 and typhoid fever at 8 She had been a known cardiac since the age of 21 with a history of frequent sore throats, parovysmal dyspnea, and ankle edema Tonsillectomy had been done at age 30 At the age of 27 she had gone through an uneventful pregnancy and labor, menopause was at 47 years

Admission examination revealed an acutely ill woman in pulmonary edema, double mitral murmur, RSR, the pulmonic second sound was greater than the aortic second sound, blood pressure was 140/82 There were signs of consolidation at the Chest x-ray revealed a heart enlarged in right base all diameters and a suggestive pulmonary infarct in the right lower lobe. On October 23, October 26, and October 30 she had episodes of chills with tem-perature rise to 102 F. Repeated blood cultures

were negative

On October 28 auricular fibrillation was noted for the first time and the patient was digitalized November 11 there was an episode of sudden pain down the left arm, followed by a sensation of numb-ness and coldness in that arm The left radial pulse was not palpable and no blood pressure reading was obtained in the left upper extremity. About a month later, the left radial pulse could again be palpated and the hand was of normal temperature The patient was discharged on December 18, 1945, with a final diagnosis of rheumatic heart disease, enlarged heart, mitral stenosis and insufficiency, auricular fibrillations, pulmonary infarction, and embolism to the upper left extremity

Laboratory data were as follows Electrocardiogram on October 19 showed regular sinus rhythm, with a rate of 80 On November 8 it showed suricular fibrillation with a ventricular rate of 75, there was an occasional pulsus bigeminus The Wasser mann test was negative Blood chemistry on Noglucose 115 mg, wea Maximum sedimentavember 15 was as follows nitrogen 28 mg per 100 cc

tion rate was 3 mm in five minutes

On admission hemoglobin was 88 per cent, red blood count 45 million, white blood count 11,200 On November 14 hemoglobin was 98 per cent, red blood count 48 million, white blood count 5,000, with 73 per cent polymorphonuclears, and 27 per cent lymphocytes Blood cultures on October 23 and 29, November 5, 8, 13, and 15 were negative Urinalyses were repeatedly negative

On February 9, 1946, the patient was re-admitted She had been on 0.2 mg of digitoxin daily and me-cupurin as indicated and had been well since her discharge until the afternoon of re-admission, when she experienced sudden pain in the left shoulder radiating down the arm and lasting a few minutes She then felt well until four hours later, when suddenly she felt pain in her right foot, which became white, cold, and numb After a short interval of treatment had a short interval of treatment by local heat at home, the lumb returned to its normal status Then there was a sudden stab of pain in the left lower extremity, which became cold, blue, and numb

Physical examination revealed moderate distention of the neck veins with the absence of normal systolic collapse. There were bilateral basal rales The cardiac apev was broad and heaving, palpable in the fifth left interspace beyond the midelavicular There was dullness at the lower end of the sternum with systolic heaving due to right ventricu-At the apex, a diastolic thrill was lar hypertrophy palpable, a snapping first sound and a middiastolic

The pulmonic second sound murmur were audible The rhy thm was totally irregular rate of 88 per minute. The liver was accontuated with a ventricular rate of 88 per minute. was palpable one finger's breadth below the costal margin. There was slight pretibial edema, bi laterally Examination of the extremities revealed the left toes to be colder than the right The right femoral, popliteal, and dorsalis pedis arteries were palpable. The corresponding vessels on the left wore not.

In view of our experience with Case 1 it was felt that the bilateral onset of signs indicated an in complete occlusion at the aortic bifurcation. The diagnosis was rheumatic heart disease enlarged heart mittal insufficiency and stonosis right and left ventricular hypertrophy auricular fibrillation Class IV E and saddle-back embolus to the ab-

dominal aorta bifurcation

The condition remained unchanged, but the right dorsalis pedis and popliteal arteries subsequently were not palpable and on March 4 1946, the right femoral artery also was not palpable No sensory changes were noted On March 6 oscillometric roadings were negative at all levels of both lower extremities. Skin temperature readings were diminished in both lower extremities more on the On April 10 oscillometric readings were negative throughout. Skin temperatures at this time revealed higher readings, especially toward the periphers. On May 2 oscillometric readings remained unchanged although subjective and objective im provement continued.

On May 8 the patient was discharged home with apparent recanalization on expectant therapy

aboratory data on this admission were as follows Liectrocardiogram on February 11 1946 showed auricular fibrillation with a vontricular rate of 80 and a QRS of 0 06 second and digitalis effect. nalyses showed red blood cells on February 15 naiyaes showed red blood cells on rebruary about were negative otherwise. Blood culture was negative on February 21. Blood count on admission was hemoglobin 104 per cent red blood count 51 million, white blood count 10 400 poly morphonuclears 74 per cent lymphocytes 24 per cent and monocutes? Per cent lymphocytes 24 per cent and monocutes of both cent, and monocytes 2 per cent. \ \-rays of both lower extremities on April 4 were negative for arterial calcification. Sedimentation rate on May 6 was 7 mm. in five minutes. The temperature was normal throughout.

Comment —The above case proves the wisdom of the dictum set forth by Reich! that we should anticipate the possibility of aertic bifurcation embelization in every case of rheumatic heart disease with auricular fibrillation, especially in women and more especially when emboli to other organs have oc-

curred.

In Case 2 the appearance of auricular fibrillation was followed shortly by embolization to the loft upper extremity and subsequently by 'rider's em bolism. In Case 1 the clinical background of mitral stences, chronic fibrillation, and clinical evidences of pulmonary infarction are also noteworthy

Case 1 exemplifies the recent explanation by Santemma' of the lower extremity pain being dependent not only on ischemia of distal peripheral nerves but more so on ischemia produced by lessened blood flow in the regional vessels, derived directly from the aorta, supplying the cauda equina and its component nerves. The blocking of the circulation in these regional vessels and not the conus medullaris circulation is said to produce the dermatome levels of impairment.

#### Discussion

Occlusive processes of the abdominal acrts bifurcation are due in 50 per cent of the cases to em bolism.\* Most frequently this occurs in women between the ages of 30 and 65 who have rheumatic heart disease, mitral stenosis, and auricular fibrillation. Other less frequent causes are cardiac infaretion with mural thrombus and embolization, and embolism from thrombi of luctic acrtitis.

Thrombo-arteriosclerosis of the aorta accounts for 35 per cent of similar occlusive processes. These instances of thrombotic phenomena superimposed on an aorta the site of ulcerative atheroma tous changes occur in 5 men to 1 woman and usually between the ages of 50 to 80

Less frequent predisposing etiologic factors are abdominal aorta aneurysm with mural thrombosis, infection (e.g., sepsis typhoid, tuberculous glands)

and retroperitoneal malignancy

One point bears emphasis. The recent knowledge concerning the thrombogenic effects of digitalis\*-1\* makes plausible the additional factor of digitalis administration bearing a role in promoting the forms tion of auricular thrombi which later embolise Then, too, the propagation of the embolus might be aided by the continuation of digitals medication. It remains to be determined whether or not the crystalline digitoxin preparations have similar thrombogenic properties. That they may have is indicated by Macht, 11 who also reports on the thromboplastic properties of mercurial diuretics. Hence the frequent exhibition of the mercurials may well be another factor in thrombogenesis. These conaiderations concerning thrombogenic properties of these medications need corroboration

#### Summary

We have presented two cases of 'rider's embolism to the bifurcation of the abdominal aorta. Both cases have been of the atypical onset described.

The frequent appearance of this syndrome in women with rheumatic heart disease mitral stenoas and auricular fibrillation has been stressed.

A new interpretation of the cause of the pain in the lower extremities and the anal and pelvic regions has been quoted.

The possible role played by the thrombogenic properties of digitalis and the xanthine derivatives and the thromboplastic properties of mercurial diuretics has been suggested

Early diagnosis to enable early treatment by the newer therapeutic methods has been emphasized.

## MIXED EMPYEMA SECONDARY TO CHRONIC PARACHOLECYSTIC ABSCESS TREATED WITH STREPTOMYCIN

BERNARD J FICARRA, MD, and GEORGE H LORDI, MD, Brooklyn, New York

RECENTLY the management of a patient with mixed empyema revealed an underlying pathogenesis of unusual interest. It was only after the performance of an incomplete necropsy that the bizarre situation was unfolded. In view of these features the presentation of this case report is believed to be significantly valuable.

The patient was a 64-year-old housewife admitted to the Hospital of the Holy Family on August 18, 1946 She had been observed over a period of four years for gallbladder disease. During those years she was treated for diabetes mellitus as well as for chronic cholecystitis, the former condition being difficult to control in the presence of the latter. Two years before her hospital admission she had a serious exacerbation of gallbladder cohe associated with chills, fever, palpable right upper quadrant mass, and leukocytosis. After an illness of many weeks, her symptoms subsided. Cholecystogram at that time revealed cholelithiasis. An operation was

contemplated following this episode

Four months before her hospitalization she had another exacerbation associated with a septic course She recovered from this attack and progressed satisfactorily until four days prior to entering the hospital, when she again had a recurrence of her symptoms and, in addition, had nausea and vomiting. At no time did she have any jaundice. She was advised time did she have any jaundice. She was ad to enter the hospital at that time, but refused the day of admission the patient was almost in com-plete shock, having cold and clammy skin, blood pressure of 90/60, respirations 30, and pulse of 124 Chest examination revealed limitation of motion on the right side with absent breath sounds, and the usual signs of pleural effusion. The abdomen showed limited movement on the right side, marked tenderness, and right upper rectus rigidity liver was displaced 8 cm below the costal margin and Hospitalization was advised again and the patient finally consented to enter the hospital on August 18, 1946

Laboratory Data on Admission.—urinalysis 4 plus sugar, 3 plus acetone, blood sugar 320 mg, red blood count 4,040,000, hemoglobin 79 per cent, white blood count 15,000 with 82 per cent polymorphonuclears, total protein 65 Gm, blood type IV, and Rh negative Subsequent laboratory studies revealed negative blood cultures

The patient was treated conservatively, which included penicilin, by one of us (G L) who managed her diabetic state in preparation for future surgery An x-ray of the chest confirmed the presence of a large amount of fluid in the right pleural cavity. The left ventricle was enlarged and the aorta showed

slight widening

A thoracentesis was performed and 900 cc of fecal, foul-smelling pus were aspirated. The only improvement noted following this procedure was a fall in temperature from 103 F to 99 8 F. This improvement was temporary. Although her general condition was poor, it was decided to perform a thoracotomy. Culture showed the following organisms. Bacillus coli predominating with secondary

invaders, namely, Streptococcushemolyticus, Staphylococcus aureus, and Vincent's organisms

On the tenth hospital day a thoracotomy was performed, and 4,000 cc of pus were aspirated. A tube drain was inserted for twenty-four hours and the wound was then left wide open for drainage, aspiration, and treatment. One gram of streptomycin was placed into the pleural cavity. The patient's physical condition was very poor during the immediate postoperative period. One-quarter gram of streptomycin was given intramuscularly every four hours, and in addition, I Gm was instilled into the pleural cavity daily. Following the operation the temperature rose to 104 F. The next day it was 99 2 F. thereafter it maintained a low grade septic course (Fig. 1).

An x-ray of the chest following operation demonstrates.

An x-ray of the chest following operation demonstrated a diminution in the amount of fluid, however, the lower half of the lung field continued to be

obscured

Following the operative procedure the patient improved clinically. The diabetes was controlled, the liver was no longer palpable, respirations were not labored, and oxygen could be discontinued. Drainage from the chest was profuse and continued to be foul

On the seventh postoperative day the patient suddenly became worse. Her breathing was labored in spite of ovygen, and restlessness was constant. Her progress was decidedly downhill from that day forward. The pulse became rapid, the chest refilled with fluid, respirations became labored, and death finally supervened on the tenth postoperative day.

A limited postmortem examination identified the underlying pathology. The initiating lesion was chronic empyema of the gallbladder with cholehthiasis. A right paracholecystic abscess contiguous with the gallbladder and the undersurface of the liver was noted. A secondary abscess of 5 cm by 5 cm was present in the upper anterosuperior area of the liver. This latter abscess had perforated into the right subphrenic abscess had perforated into the right subphrenic abscess had eroded and perforated through the diaphragm, and thus entered the pleural cavity, resulting in the right-sided empyema, which evidently was the cause of the rapid filling of the pleural space (Fig. 2)

### Discussion

This case presentation illustrates an infrequently encountered complication of chronic gallbladder disease The clinical picture is one of exacerbations and recrudescences in a patient with diabetes mel-Her first episode of four years ago apparently was acute cholecystitis with a severe pericholecystic inflammatory reaction Two years later the septic course was interpreted by her family physician as empyema of the gallbladder with the possibility of a hepatic abscess Hospitalization and surgical intervention were refused by the patient at that time The septic course four months before entering the hospital was compatible with the formation of the hepatic abscess burrowing into the right, subdia-

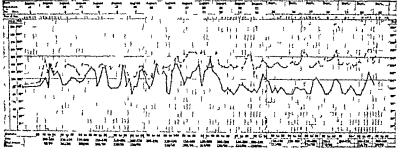

Fig 1 Temperature Chart.

phragmatic space The period preceding hospitalization was the time in which the subphrenic abscess was ereding into the pleural space. When the pleural cavity was finally entered the patient presented the picture of shock.

It appeared as if every episode of serious gall bladder colic stimulated inflammatory activity and accolerated abscess formation. This was a chronic process extending over a four-year period. The abscess formations plus the diabetes were the even tual cause of death occurring in spite of the administration of penicillin and streptomyem.

The culture taken from the pleural cavity identified a variety of organisms which produced the mixed type of empyema. Because of the variety of organisms both penicillin and streptomycin specific for B coll were employed. In spite of this intensive therapy and surgical drainage the patient succumbed.

### Summary and Conclusions

1 An unusual case is presented of putrid, mixed empyema secondary to chronic purulent infection of the gallbladder and caused by B coli.

2 At the end of a four year period the patient developed a paracholecystic abscess, a hepatic abscess, and a subphrenic abscess which eroded into the pleural cavity

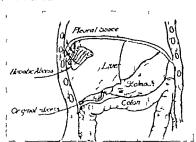

Fig. 2. Anterior view of the abdomon showing original paracholocystic abscess and the metastatic hepatic abscess with its passage into the subphrenic space and finally its entrance into the pleural cavity through the disphragm.

3 Treatment consisted in controlling the dia betes, open thorseotomy and the administration of streptomycin both in the pleural cavity and intra muscularly plus pencillin.

4 Death supervened in spite of intensive medical treatment and surgical intervention

567 First Street

### FREQUENCY BANDS FOR MEDICAL DIATHERMY EQUIPMENT

Medical diathermy equipment may be operated on the 13 66-megacycle, 27.32 megacycle, and 40 98-megacycle bands without license according to Public Notice #7723 of May 9 1947 released by the Federal Communections Commission No limit is given to the power output that may be radiated Diatherny appearatus operated outside the assigned frequency bands above shall be completely shelded and filters placed in the power line. The Commission will determine if the diathermy equipment is not operating in compliance with the rules and in such cases will notify the owner who is responsible for making the changes to prevent interference.

All equipment manufactured before July 1 1947, will not be subject to the new regulation for a period of 5 years (June 15 1952)

A special band at 2,450 megacycles has been made available for industrial, scientific, and medical purposes. This is to allow the production of experimental machines of extremely short wavelength—approximately 12 contimeters long. Such machines have not been used by the medical profession up to the present time. However this channel may be subject to development in later years as the medical profession either accepts it or not.—Secretary s Letter A M.A. June 30 1947

### Public Health Grants for Cancer Research

PUBLIC health grants of \$363,749 have been awarded recently by the Federal Security Agency to universities and state health services for cancer

research and control

The grants, part of the \$14,000,000 program authorized by Congress for the 1948 fiscal year, will finance research on improved technics for professional cancer instruction, a nation-wide survey of cancer clinics, and evaluation of various cancer control measures

The projects were recommended by Dr A V

Deibert, chief of the national cancer institute's cancer-control subdivision, and were approved by the National Advisory Cancer Council, a non-governmental committee of cancer specialists. They included The American College of Surgeons, \$30,-340, to survey cancer clinics throughout the United States, American Cancer Society, \$36,600, for a cooperative project for production of diagnostic motion pictures, Yale University Medical College, \$2,000, improvement of cancer teaching, Cornell University, \$37,800, a cytologic diagnosis center

### Academy to Have Lectures to the Lasty

THE New York Academy of Medicine, 2 East 103rd Street, New York City, is now sponsoring

103rd Street, New York City, is now sponsoring its thirteenth series of lectures to the laity. The subject of the series is "Perspectives in Medicine". Dr. George Ronald Hargreaves, former assistant director of the Army Psychiatric Division, British War Office, will speak on "The Psychology of Leadership in War and Peace," on Wednesday evening, November 19, at 8 30 PM. Presiding chairman at the lecture will be Dr. Frank Fremont-Smith "Food and Civilization" will be the subject of Sir Raphael Cilento director of the Division of of Sir Raphael Cilento, director of the Division of Social Activities for the United Nations, Lake Success, who will speak on Wednesday night, December 17, at 8 30 PM Dr Frank G Boudreau will be chairman

Dr Edward J Stieglitz, chief of medical staff, Suburban Hospital, Washington, D C, will have as

his subject, "On Being Old Too Young," on Thursday night, January 22 Chairman for the lecture will be Dr Russell L Cecil Dr Cornelius P will be Dr Russell L Cecil Dr Cornelius P Rhoads, director of Memorial Hospital, New York City, will speak on "Perspectives in Cancer Research," on Wednesday night, February 4 Presiding chairman will be Dr Harold Brown Keyes. Dr William C Menninger, of the Menninger Foundation, Topeka, Kansas, will give the George R Siedenburg Memorial Lecture on Thursday evening, February 26 His subject will be "Psy chiatry for Everyday Needs" Dr Thomas A. C Rennie will be presiding chairman On Thursday evening, March 11, Dr James B Conant, president of Harvard University, will speak on "The Interelation of Pure and Applied Science in the Field of Medicine" Presiding chairman for the lecture will be John W Davis be John W Davis

### Neuropsychiatric Residencies Available in New Jersey

OPENINGS are available in neuropsychiatric residency at the Veterans Administration Hospital, Lyons, New Jersey The residency has been approved by the Council on Medical Education and Hospitals, the American Medical Association, and by the American Board of Psychiatry and Neu-

rology
The course consists of one, two, or three years' training with intensive postgraduate teaching in clinical neurology and psychiatry, psychopathology,

clinical psychology and related sciences, neuro anatomy, neurophysiology, neuropathology, and neuroroentgenology

The type of instruction, supervision, and train ing is carried out in accordance with the requirements of the American Board of Psychiatry and Neurology

For further information, apply to Dr A Pauncz,

acting director of professional education, Veterans Administration Hospital, Lyons, New Jersey

### Education for Prevention Chief Goal of Venereal Disease Fund Drive

E ARLY detection and treatment of venereal diseases to minimize the spread of infection from person to person will be the primary aim of the 1948 program of the American Social Hygnene Association, Howard S Cullman, chairman of the Association's current New York fund-raising campaign, said recently

The major factor toward the disease's control must be to bring the victim to the doctor before the germ is passed on The Association plans to work closely with government health agencies, hospitals, and other groups in intensifying its educational program for early treatment, while continuing its general education for prevention

#### PERSONALITIES

Retired.—Dr Aendall Emerson managing director of the National Tuberculosis Association, after twenty years work with the organization managing director since 1928, effective January 1, 1948 Dr Douglas Gordon, head of Odell Sanatorium, Newburgh, since 1947 Dr Edward McPherson Armstrong medical director of the Mutual List Insurance Company of New York for the past

twenty-eight years

Honored.—Dr James C McClelland Toronto, recently elected president of the Western New York and Ontarno Urological Society Dr J Sydney Ritter New York City, who discussed Renal Neoplasms" at the Third American and Fourth Brailian Urological Congress in Ruo de Janeiro recently at the invitation of the Brazilian government. Dr Donald P Ross Niagara Falls, former commander in the U.S Naval Medical Corpe navarded a commendation ribbon for 'excellent service in line of his profession on Iwo Jims in March, 1945 Dr A. M Crance Geneva re-cleoted secretary and treasurer of the Western New York and Ontario Urological Society. Dr Walter S McClellan, medical director of the Saratoga Spa, who presided at the twenty fifth annual meeting of the American Congress of Physical Medical in Minneapolis, Minnesota, in September Dr Mary Theress Green, who has recently completed her fiftieth year of medical work at the Wyoming County Sanitarium where she has been proprietor and medical director

Appointed.—Dr James E. Perkins, former deputy commissioner of the Stato Health Department, who served with the Italian Medical Nutrition Mission as codirector of the epidemiologic branch, effective January I, managing director of the National Tuber culosis Association. Dr Milton J Matsmer, Brooklyn, who served as commander in Naval Medical Corps during World War II, as consultant in gnatureenterology to the Veterans Hospital at Manhattan Beach Dr Wendell R. Ames, former health commissioner of Cattaraugus County, as director of the medical care section of the Baltumore,

Maryland, Department of Health Dr Jesse D Stark New York City, choof roentgenologist of Gouverneur Hospital, as surgical consultant in radiology for the Station Hospital, United States Military Academy West Point Dr Granville W Larimore, New York City, educational director of the American Cancer Society for the past year and chief of the Army's Health Education Unit during World War II, as director of the State Department of Health & Odice of Public Health Education

New Officea.—Dr John F Flynn, Addison after five years sorvice in Naval Medical Corps, now associated with Dr Luther A. Thomas at the Thomas Clinic in Painted Post. Dr James P Hoffman, in Bolivar, for practice of general medicine. Dr Leonard M Niesen and Dr Joseph P Gold, formerly of the Van Winkle Clinic new offices

in Hudson

Dr Ralph M Cudlipp Jr Winthrop, where he is associated with his father, also now practicing medicine in North Lawrence and Hopkinton Dr Lowis J Graham, Corning formerly with the Navy Medical Corps attached to the Marine Corps, and for the past two years medical director of the Corning Glaza Works, now associated with Dr L. E. Whipple in Corning Dr Philip Hust, physician in Hamden for the past seven years, now in Delbi.

Dr George F Nevin Newark, battalion surgeon with the 85th Regiment of the Tenth Mountain Division in the Italian Campaign during World War II associated with Dr Hugh Frail in Marathon Dr Paul W Myers Schoharie with Dr Donald C Walker for the practice of general medicine in Delanson. Dr Tobias M Rubin, in Yonkers for the practice of general medicine and surgery after being chief of medical service of the U.S. Armys 85lst Station Hospital in Tokyo. Dr L. D. O Nelli, after three years of active duty with the U.S. Seventh Fleet amphibious and submarine service, former physician in charge of medical and surgical service at Central Islip Hospital Central Islip now in general practice Valloy Stream.

### COUNTY NEWS

#### Albany County

"Recognition and Treatment of Electrolyto Disturbances in Diarrhea was the topic of Dr Daniel Cady Darrow professor of pediatrics at Yale University Medical School, when he spoke to mem bers of the Albany County Medical Society at their meeting on October 22 at the Albany College of Pharmacy

Following his talk, a lengthy discussion was held, with Dr Otto Faust and Dr Hugh Leahy as

leadera.

### Allegany County

At the September meeting of the Board of Super visors of Allegany County a lotter from the Medical Society of the County of Allegany was read, requesting the board to "reconsider the cetablishment of a county health unit and subsequent county hospital plan in Allegany County."

of a county health unit and subsequent county hospital plan in Allegany County. The Woman's Auxiliary of the Allegany County Modical Society also advised the Board that it had passed a resolution asking that the county health service plan be resubmitted to the Board and went on record as unanimously in favor of that plan, ask ing that action be taken at the earliest possible date

#### Bronx County

'The Sanitary Code as Related to Obstetres in the Hospitals' was the subject of a talk presented to members of the County Society on October 15 by Dr Samuel Frant, doptuy commissioner of health. The discussion was opened by Dr W John Dolan Dr Samuel Weiskopf newly elected president of the Society gave his inaugural address at the meeting

#### Broome County

Dr Hyman Spelcrson was the speaker at the scientific session of the October meeting of the Broome County Medical Society His subject was Surgery in the Patient Over Sixty five

#### Cayuga County

With the cooperation of the Cayuga County, Medical Society and the County Dopartment of Health, arrangements were made to provide free x ray examinations for all Cayuga County residents over fifteen who had not had such an x ray taken within the past three years. The program was supervised by the Cayuga County Health Association and expenses were met from funds derived from the sale of Christmas seals.

### Chemung County

Dr David J Kaliski, director of the Bureau of Workmen's Compensation of the Medical Society of the State of New York, acted as moderator of a panel discussion on workmen's compensation, held on September 17 in Elmira at the meeting of the Chemung County Medical Society Among the members of the panel were Dr Norman's Moore, of the State Society, and Dr Laurence Hobler, of the County Society

At the business meeting which followed the discussion, the resignation of Dr E F Butler as chairman of the Compensation Committee was accepted, and Dr W J Gusick was appointed chairman Dr Butler has been appointed second in charge of the Veterans Administration in New York State Also named to the committee was Dr J H Burke, Jr

A business meeting of the County Society was held on October 8 at the Arnot-Ogden Hospital, in Elmira, with the main topic of discussion being the report of the Public Health Committee on the adoption of a County Health Unit Dr George Murphy reported that the Health Unit had failed to be approved because of a lack of support by the members and their failure to contact their supervisors to request favorable action. The matter had been tabled by the Board of Supervisors, and it was stated to be too late to revive it this year Dr W R Phillips moved that the County Society go on record as standing behind the Health Committee's report of last year in favor of the establishment of a County Health Unit, and that the County Supervisors should be so notified. The motion was seconded and unanimously approved.

Dr George Murphy reported on the meeting of October 1 with representatives from the Council of Rochester Regional Hospitals, and explained the advantages of joining in this eleven county test plan. The members unanimously approved joining the

Dr J Scott Howland, reporting for Dr Lynch on the Cancer Committee meeting, stated that the Community Chest had allocated \$10,000 for cancer work, \$6,000 of which is to be spent locally. The following two recommendations were made by the Committee (1) the possible setting-up of two cancer detection clinics in the city, one at each hospital, (2) the acceptance of the State's offer of free radium for treatment of cancer patients in this area. At Dr Howland's recommendation, the Society accepted the State's offer of radium. The motion that the formation of two cancer detection clinics in the city be approved resulted in a tie, and the president then appointed a committee to work out the details of a cancer control program and submit it at the next meeting. Members of the Committee are Drs. J. F. Lynch, R. Scott Howland, A. H. Hillman, W. T. Boland, H. L. Walker, F. S. Hassett, H. Burch, and S. E. Cohen.

### Clinton County

"The Management of Diabetes with the Various Forms of Insulin" was the subject of a lecture given to the County Medical Society by Dr Byron D Bowen on October 16 Dr Bowen is professor of clinical medicine, University of Buffalo, School of Medicine The lecture was a cooperative endeavor of the Council Committee on Public Health and Education of the State Medical Society and the New York State Department of Health

### **Dutchess County**

Dr Gerald Pratt, of New York City, spoke to members of the Society on October 8 at the monthly meeting His subject was peripheral vascular diseases

Postgraduate instruction, arranged for the County Society by the State Medical Society in cooperation with the State Department of Health, was given on November 12 by Dr Frederick S Wetherell, professor of clinical surgery, Syracuse University, College of Medicine His lecture was entitled "The Relation of the Sympathetic Nervous System to General Medical Problems"

### Erie County

The 1947-1948 season of the Medical Society of the County of Erie began on October 28 with a program titled "Chinical Afternoon and Evening" at which three outstanding physicians in their respective fields were heard. At the afternoon session Dr. Frank. H. Lahey, of Boston, discussed "Present Concepts in the Surgical Treatment of Peptic Ulcer, Resection v. Vagotomy," and Dr. Sidney Farber spoke on "The Treatment of Cancer in Children" Dr. Farber is chairman of the Division of Laboratories and Research of the Children's Hospital, Boston, pathologist-in-chief of the Children's Hospital, and assistant professor of pathology at Harvard Medical School

Also speaking at the afternoon session was Dr Louis M. Hellman, associate professor of obstetrics, Johns Hopkins Hospital, Baltimore His subject was "The Use of Pituitrin in Obstetrics."

At the evening session Dr Lahey again addressed the group with a talk entitled "Management of Diseases of the Thyroid Gland"

### Jefferson County

Two programs of postgraduate instruction, arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York, were held recently for members of the Jefferson County Medical Society, at the Woodruff Hotel, Watertown
On October 9, Dr Robert O Gregg, associate

On October 9, Dr Robert O Gregg, associate professor of clinical surgery at the Syracuse University, College of Medicine, spoke on "Treatment of Massive Hemorrhage from Peptic Ulcer," and on November 13, Dr Joe W Howland, instructor in medicine at the University of Rochester, School of Medicine and Dentistry, spoke on "Medical Aspects of the Atomic Bomb"

### Kings County

Three lectures were presented to the County Society members at the scientific program of the October state meeting "Differential Spinal Block" was the subject discussed by Dr Stanley J Sarnoff, research and clinical fellow, department of surgery, Harvard Medical School, and "Sulfadiazine and Penicillin Prophylaxis in Prolonged Labor with Special Reference to Cesarcan Section" was the subject of Dr R Gordon Douglas, associate professor of obstetrics and gynecology, Cornell University Medical College, and obstetrician and gynecologist, New York Hospital The last lecture, entitled "The Cancer Problem in Brooklyn," was presented by Dr S Potter Bartley, chairman of the Brooklyn Cancer Committee of the American Cancer Society, Inc

The final Friday afternoon lecture of the fall season will be given on November 21 on the subject of abdominal surgery in infants and children. The lecturer will be Dr. William H. Lanman visiting surgeon, Children's Hospital, Boston, and assistant professor of surgery Harvard Medical School

The medical profession is cordially invited to attend a meeting of the Pediatric Section of the Kings County Medical Society on Monday ovening, November 24 at 9 00 r m at the Medical Society of Budding, 1313 Bedford Avanue Brooklyn Dr William Damesbek, of Boston, will speak on Blood Diseases in Inlancy and Childhood and Their Treatment.

#### Livingston County

Members of the Lavingston County Medical Society met on October 1 as the guests of the medical staff of Craig Colony Sonyea. Dr Douglas Taylor of Toronto, presented an illustrated talk on "Ar thritis, Its Diagnosis and Treatment."

#### New York County

Philip McCord Morse Ph.D., was the principal speaker at the October stated meeting of the New York County Medical Society Dr Morse, director of the Brookhaven National Laboratory explained the important developments of radioactivity its scope and the effect of atomic radiation on health, nutrition disease, and pathology Dr Lloyd F Craver, of the Memorial Hospital discussed the talk, telling of the pioneer work in the application of atomic radiation in the field of cancer research

#### Oneida County

Dr Charles LoRoy Steinberg, senior visiting physician and physician-in-charge of the arthritis clinic at the Rochester General Rospital spoke on chronic arthritis at the meeting of the Oneida County Medical Society on October 14 at the Rome State School, Rome.

The lecture was part of the postgraduate instruction arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York, for the County

#### Society

#### Onondaga County

A symposium entitled 'The Appraisal of Rational General Practice was held at the October meeting of the County Medical Society Participants in the discussion were Dr W Walter Street and Dr Paul C Clark. Dr Richard II Lyons was moderator

#### Queens County

The annual joint meeting of the Queens County Medical Society and the Queensboro Tuberculesis and Health Association was held on September 30 The program included a talk by Dr. Carl Muschen leim, assistant professor of clinical medicine at Cornell University Medical Collego, on 'Streptomycin in the Truatment of Tuberculesis, and a talk by Dr. Milton I Levine, assistant professor of pediatrics at Cornell University Medical College, on 'The Present Status of BCG'

#### Schoharie County

Three programs of postgraduate instruction arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York for the Schoharze County Medical Society were held during October The first two at the Cobleskill Library Cobleskill, were

given by Dr David P Earle Jr., assistant professor of medicine at the New York University College of Medicine, on "Renal and Cardiae Aspects of Arteriosclerosis and Aging, and by Dr A. Wilbur Duryce, associate clinical professor of medicine, College of Physicians and Surgeons, New York on Peripheral Vascular Aspects of Arteriosclerosis and Aging

At the annual meeting on October 14 at the Coblekill Golf Club a talk on "Neuropsychatrac Aspects of Arteriosclerosis and Aging" was given by Dr Morris Herman associate professor of psychiatry at the New York University College of Medicine

#### Suffolk County

Dr Albert F R. Andresen, professor of clinical medicine Long Island College of Medicine, presented a postgraduate lecture to members of the County Society on November 5 His instruction on gallbladder disease was provided by the State Medical Society in cooperation with the State Department of Health

### Sullivan County

Dr Eldridge H. Campbell professor of surgers and director of the department at the Albany Medical College spoke on "Brain Tumors" at the meeting of the Sullivan County Medical Society held on October 8 at the Lenape Hotel Liberty The program of postgraduate instruction was arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York for the County Society

#### Ulster County

The Rh factor was the subject of the scientific session of the fall meeting of the Ulster County Medical Society held October 7 at the Kingston City Laboratory. The speaker was Dr Irving B Wexler of the Brooklyn Jewish Hospital who was a coworker in the original research work on the Rh factor Participants in the discussion which followed were Drs. John B Krom, F. E. O Connor E. S. Goodyear, J. J. Jacobson and J. S. Taylor Dr Alfred M. Feldshuh was chairman of the meeting.

#### Warren County

Postgraduate instruction arranged by the Council Medical Society of the State of New York for the Warren County Medical Society was the feature of the annual meeting held October 9 at Glens Falls Dr Thomas H McGavack, professor of clinical medicine at the New York Medical College spoke on The Treatment of Hyporthyroldism.

#### Wayne County

Dr John C. M Brust, associate professor of surgery at the Syracuse University College of Medicine spoke on The Bignificance and Management of Infections of the Anua, Rectum, and Coceyx, at the meeting of the Wayne County Medical Society on October 14 at Lyona. The program of postgraduate instruction was arranged for the County Society by the Council Committee on Public Health and Education of the Medical Society of the State of New York.

#### Westchester County

Dr Froderick W Williams president of the New York Diabetes Association, spoke to members of the County Society at the monthly meeting in October His talk was ontitled 'Present Status of the Treat ment of Diabetes—Including Surgical Complications of the Lower Extremities.'

### HOSPITAL NEWS

### Seven Hospitals Join New York University Study Plan

THE Regional Hospital Plan of the New York University College of Medicine is now in progress with twenty-four doctors from seven hospitals within a 100-mile radius of New York participating

The new program, according to Dr Clarence E de la Chapelle, associate dean and director of the college's postgraduate division, is designed "to bring to independent, nonteaching hospitals, the advantages of a working relationship with a university medical school" It will make possible, he explained a continuing process of education to staff members of affiliated hospitals

Dr de la Chapelle said that emphasis would be placed on the training of interns and residents, with particular attention to the training of residents in the basic sciences as applied to the various fields of

medicine and surgery

Spending a full academic year at the College of

Medicine, residents of affiliated hospitals will study subjects applicable to their residencies and will receive intensive instruction in the basic medical sciences

The hospitals participating in the plan will be required to supply maintenance facilities for the student-doctors. The university, however, will not charge tuntion fees. Doctors enrolled in the program have agreed to return to the member hospitals for at least a year following the course.

program have agreed to return to the member hespitals for at least a year following the course Organizations that have enrolled in the program are Grasslands Hospital, Valhalla, New Rochelle Hospital, Flushing Hospital and Dispensary, Monmouth Memorial Hospital, Long Branch, New Jersey, Fitkin Memorial Hospital, Neptune, New Jersey, North Country Community Hospital, Glen Cove, Long Island, and St Luke's Hospital, Newburgh

### Hospitals to Cooperate in Food Emergency Campaign

GRAHAM L Davis, president of the American Hospital Association, has called on the nation's hospitals to cooperate with President Truman's request to observe meatless Tuesdays and to serve no poultry or eggs on Thursdays as their contribution to the Food Emergency Campaign "Compliance with the President's request," Mr

"Compliance with the President's request," Mr Davis said, "should be possible in so far as meals to hospital personnel and routine food service to patients must necessarily follow the physicians' recommendations in the interest of proper patient care"

An average of 1,142,000 patients are in the nation's

6,125 hospitals of all types, Mr Davis pointed out, and he said the hospitals can make substantial contributions to the program "Hospitals purchase an average of six ounces of meat per patient per day. Thus, a possible daily saving of meat in hospitals among patients alone amounts to approximately 6,852,000 ounces or 428,250 pounds for each Tuesday the meatless campaign is observed. In addition, he stated, "these hospitals employ approximately 830,000 full-time personnel, many of whom eat one or more meals daily in hospitals, a source of a considerable additional saving"

### **NEWS NOTES**

The site of the new Edward John Noble Hospital in Gouverneur will be on the south side of West Barney Street, according to a recent announcement by hospital authorities, and will be high above the north bank of the Oswegatchie River The hospital is scheduled to have 60 beds. It is one of the three hospitals planned for the North Country section of the State, the other two being at Alexandria Bay and Canton

A plan for establishing a central purchasing program for the twenty member hospitals of the Council of Rochester Regional Hospitals was approved recently by the Council's board of directors, giving to the hospitals a joint membership in the Hospital Bureau of Standards and Supplies Membership will enable the Council to make quantity purchases at a saving of hospital costs The Council includes hospitals in Wayne, Yates, Ontario, Seneca, Monroc, Orleans, Chemung, Allegany, Schuyler, Steuben, and Livingston counties

Last year 10,424 patients received 108,066 days of care, the majority of them without fee or below cost, in Beth Israel Hospital, New York City, according to the hospital's fifty-seventh annual report. The largest nonsectarian hospital conducted under Jewish auspices, Beth Israel had 178 postgraduate physician-students enrolled for four to sixteen weeks for specialization during the 1946 to 1947 academic session. The hospital was founded in 1890 "to establish and maintain a hospital in the City of New York where poor people will receive medical advice and treatment free of charge"

Three cancer-prevention clinics, established by the Brooklyn Cancer Committee during the last year, reopened this fall after a summer recess, it was announced by Dr S Potter Bartley, committee chairman The clinics are at the Brooklyn Cancer Institute, Methodist Hospital, and St Mary's Hospital Appointments for examination at these clinics may be made at the Little Red Door Information Center

Members of the netive medical staff of Little Falls lospital were hosts in September to the hospital sensulting staff of specialists Dr Joseph Conrad is president of the staff and Dr A L Lombardi was chairman of the program committee. Consultants attending were Dr Ross D Helmer of Jordanville, formerly of Utica Drs L. L Bryan, P L. Turner M Stovens, R. C Hall Edward Evans, and H D Parkhurst, all of Utica and Dr Herbert Schwarts superintendent of Pine Crest. Also present were Dr Evelyn Rogers, of Utica district State health officer and Dr David Park, a representative of the American College of Physicians and Surgeons.

Oswego Hospital was observed in action by the citizens of Oswego during the hospital s open house in September Demonstrations, with medical staff menand technicans in attendance were set up in the emergency room, v rav department operating room maternity department, and laboratory Physicians who participated were Drs. Grover C Elder Francis L. Carroll, L. Wood Jarvis Bonjamin Seldenberg Ohn J Mowry, Harvey S Albertson Milton W Kogan Frank Frost Gaspar J Fatta, and G A Marsden

A special pain clinic to instruct medical special ists and educators throughout the United States in the nerve block technic of anesthetics has been opened at New York University College of Medicine. The first of its kind, the newly formed clinic will put into practice the revised procedures of nerve block technic that have been developed since the war Dr F A. Rovenstine is chaliman of the department of anesthesia at the College

Appointed.—Dr David II Ross, connected with the Mount Sinal Hospital in New York City since 1941 as the director of the Jewish Hospital Cincin nati Ohio Dr Loo W Tuckor, executive officer of the U.S. Marine Hospital on Staten Island since July, 1945 and veteran of twenty-six years' service in the U.S. Public Health Service, as chief quarantine officer for the Hawalian Islands and officer in charge of the medical reliof station in Honolulu. As associate professor in the department of medicine of the Yake University School of Medicine Dr David M Kydd, former associate in medicine at the Mary Inugene Bassett Hospital in Cooperstown where he was an active member of the staff for thirteen years

Dr. Alexander Brunschwig, former professor of surgery at the University of Chicago as a department head at Memorial Hospital, Center for Cancer and Allied Diseases in New York, City and as professor of clinical surgery at Cornell University, Medi-

cal College.

Eloven staff members of hospitals in New York City and Cooperstown to the staff of the College of Physicians and Surgeons, Columbia University from St Lukes Hospital, New York City Dr William F Maelee as clinical professor of surgery Dr Bonjamin Shore and Dr Paul Calhoun Morton as assistant professors of surgery, Dr John J Keating, Dr Albort C Herring, and Dr Waldo B Farnum as assistant clinical professors of medicine from Goldwater Memoral Hospital Wolfaro Hand, Dr Margaret Bovans as assistant clinical professor of pathology Dr Robert W Berliner as assistant professor of medicine and Dr David Tanchester as clinical professor of dentistry, from the Mary Imogene Bassett Hospital in Cooperatown, Dr James Bordloy III as associate clinical professor of medicine, and Dr Monroe A McIver as associate professor of surgery

### NUTRITION MAY BE FACTOR IN POLIO

A study of the 1946 infantile paralysis outbreak in Chicago shows increasing incidence of the disease in higher age groups, especially in rural areas, and emphasizes the importance of nutrition in its background, two physicians reported in the September issue of the Illinois Medical Journal official publics then of the Illinois State Medical Society

The two physicians are Archibald L. Hoyne M.D., superintendent of the Chicago Municipal Contagious Disease Hospital and Peter J. Cotafrilos M.D. pediatnes divison Cook County Hospital.

Reviewing 225 cases of pollomyelitis admitted to the contagious disease department of Cook County Hospital in 1946 out of 1006 reported for Cook County during the year the two doctors emphasized nutrition as 'what has seemed to be a constant factor in susceptibility to the disease in years past and has become increasingly apparent.

In discussing the physical characteristics of pollo-

In discussing the physical characteristics of pollomyelitis patients in 1916 one of us described the victims as exceptionally well nouristed and mentoned the fact that the discase somed to prefer blondes. Some thirty years ago a negro with pollomyellitis was quite a rarity among our hespital patients.

More recently the Negro race has contributed a much greater number of cases during epidemic periods. Can it be that a higher scale of living with general improvement in nutrition and sanitation is responsible for this change?

They also recalled reports in medical literature indicating that a deficiency of thiamin one of the B vitamins seemed to necessor resistance to the disease in experiments with mice. Some authorities believe that the virus, as a parasite organism lacking the power to live independently, must have a well-pour ished heat on which to feed. Poorly nourished children therefore may exhibit a relatively greater re-

There were 51 negroes among the 225 patients more than 22 per cent of the total.

The authors pointed out also that in the last 30 years the number of adults stricken with infantile

sistance to the disease.

paralysis has been increasing.

A higher susceptibility was also noted in the case

studies for rural patients in the older age brackets.
Commenting on the symptoms axidiated by the
225 patients, the physicians noted that fever was the
most characteristic 218 of the patients running a
high temperature

Other common symptoms the onset of which usually occurred within four days, were stiffness of neck, 172 cases headacle 150 stiffness of back 130 loss of appette 101 vorming 95 and naives SE Fifty four patients complained of sore threat

and 46 listlessness.

### **NECROLOGY**

Howard Dennis Collins, M D, 79, of Millbrook, died on October 8 After graduating from Yale University in 1890 and from the College of Physicians and Surgeons, Columbia University, in 1893, Dr Collins practiced medicine in New York for twenty years He served in World War I as a major in the Army Medical Corps From 1895 to 1904 he was an assistant demonstrator of anatomy at the College of Physicians and Surgeons and was attending surgeon at Knickerbocker Hospital, New York City, from 1906 to 1919, and at City Hospital, Welfare Island, from 1907 to 1925 Dr Collins retired from active practice soon after the war, but remained with City Hospital as a consulting surgeon With W H Rockwell he wrote Handbook of Physiology, he also contributed to Johnson's Surgical Technique He was a member of the New York Surgical Society and the Academy of Medicine, a fellow of the American College of Surgeons, and a member of New York State and Dutchess County medical societies

Edwin Thomas Redmond, MD, of Brooklyn, died on October 8 at the age of 54 He was graduated from Eclectic Medical College in Cincinnati, Ohio, in 1916 Dr Redmond was pediatrician at the Prospect Heights and Brooklyn Nursery and Infants' hospitals, both in Brooklyn He was a member of the New York State and Kings County medical societies and of the American Medical Associ-

John Wilson Sayer, M D, of Watertown, died on September 25 at the age of 37 He was graduated from Syracuse University, College of Medicine, in 1935, and then completed postgraduate work at St Vincent's Hospital, Staten Island, and St Joseph's Hospital, Syracuse Dr Sayer practiced medicine in Gouverneur until he entered the US Army Medical Corps in December, 1940 For eighteen months he was on duty in the European Theater of Operations, specializing in anesthesia He completed a residency in anesthesiology at Flower Fifth Avenue Hospital, New York City, last year and had since been engaged in the practice of anesthesiology in Watertown He was also on the staff of the Van Duzee Hospital in Gouverneur Dr Sayer was a member of the American Society of Anesthesiology.

the Jefferson County and New York State medical societies, and the American Medical Association

Clarance Henry Smith, M D, 72, of the Bronx, died on October 6 After graduating from Bellevue Hospital Medical College in 1899, Dr Smith interned at the Smith Infirmary, now the Staten Island Hospital For ten years he had a general medical practice and then specialized in ear, nose, and throat medicine For twenty-five years he was a faculty member of the New York Post-Graduate Medical School, and since 1934 he was professor of clinical otolaryngology there He was consultant in ear and throat diseases at Mother Gabriel Memorial, Morrisania, Bronx, Union, and St Elizabeth's hospitals, all in the Bronx He was also an ear special ist at the Manhattan Eye, Ear, and Throat Hospital, and a consultant at the Bronx Eye and Ear Infirm ary

Dr Smith was a diplomate of the American Board of Otolaryngology and a fellow of the American College of Surgeons and the Academy of Medicme. He was a member of the Bronx County Medical Society, the American Medical Association, the American Laryngological, Rhinological, and Otological Society, the American Academy of Ophthalmology and Otolaryngology, and the American Otology Society

Frederic E Sondern, M D, 80, of New York City, died on October 10 A pathologist credited with introducing several testing technics to the United States, Dr Sondern was a former president of the Medical Society of the State of New York He was graduated in 1889 from the College of Physicians and Surgeons of Columbia University and served his internship at German Hospital, now the Lenor Hill Hospital

He was associated with Post-Graduate Hospital, New York City, and at one time was president of its medical school Dr Sondern was also a past-president of the Society of Clinical Path ologists, and a member of the American Society of Pathologists and Bacteriologists, the Academy of Medicine, the New York Pathological Society, and the American Medical Association

A memorial to Dr Sondern appears in this issue of the Journal on page 2413

### 1948 MEETING OF THE AMA TO BE IN CHICAGO

The House of Delegates of the American Medical Association selected Chicago as the 1948 convention city, Atlantic City for the session in 1949, and San Francisco in 1950

Important among the resolutions adopted recently by the house of Delegates was the one discharging the Committee on National Emergency Medical Service and constituting this body as a council of the Board of Trustees, to be known as the Council on National Emergency Medical Service This is a real progressive step, and the work of this group will go forward toward planning for medical care of civilians and military personnel in the event of a national emergency

Adopted in toto were the recommendations made by Dr Edward L Bortz of Philadelphia, our new president They were

1 A two-day scientific session for general practitioners at the time of the semiannual meeting of the House of Delegates.

2 Change of meeting place for the semiannual session—to convene in a different geographic district each year—at which time the two-day session for general practitioners would be held

3 Closer affiliation with third and fourth year medical students—possibly by affiliate membership—and re-establishment of a student section in the Journal, and encouragement of presentation of scientific papers at county, state, and even national levels, also to study the possibility of a student section of the scientific assembly

### WOMAN'S AUXILIARY

#### TO THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

#### Executive Board Coordinates Year's Activities

THE Executive Board of the Woman's Auxiliary to the Medical Society of the State of New York met on October 7 and 8 in Port Jervis to coor dinate the activities of the Auxiliary Mrs Harry F Pohlmann, State president, and chairman of various committees presented reports and made suggestions as to possible projects which the Auxil iary could adopt during the coming year Two of the current projects discussed were Physicians' Home and scholarships and loans for needy nursing students

The meeting opened with a modified conference of the county presidents, at which an informal discussion of the programs and projects of the year brought forth an interchange of ideas, pointed out the problems each auxiliary faced, and the methods and solutions undertaken. The net result of this meeting was to stimulate the county presidents to

active participation in the Auxiliary program.

Guest speaker at the dinner on October 7 which closed the first day's seesion, was Mr Loc B Mailler, majority leader of the State Assembly and chair-man of the Advisory Board and the Joint Hospital Survey and Planning Commission. He stated that an active constructive interest by women in the health of their community can go a great way toward solving the health problems of the State. proof of what can be done in small communities Mr Mailler, who is superintendent of the Cornwall Hospital, cited the accomplishments of the Citi zens' Public Health Committee organized last year by women in Cornwall. Establishment of immuni zation clinics raising of money for a new hospital, and a number of other services to the hospital are among the committees achievements, he stated.

Mr Mailler also spoke briefly of the maldistribution
of doctors in New York State saying that 'there are too many in the cities and too few in the rural areas.

At the morning session on October 8, Mr Thomas E. Walsh, of the Public Relations Bureau of the State Modical Society spoke on the need for Auxihary members to "determine whether or not their dootor husbands were participating in medical care plans. He emphasized the part they could play in pointing out the necessity of the individual doctor to laten to the voice of public opinion which is demanding some type of prepaid medical

Mrs. Harry Van Wagenen, State Commander of the Field Army of the American Cancer Society was a guest speaker at the luncheon session that day She stressed the vital need for continued awareness

of the cancer problem.

The National president-cleet of the Woman's Auxiliary to the American Medical Association, Mrs. Luther H. Kice, of Garden City was present at the meeting and was introduced to the group by

Mrs Pohlmann

Mrs Pohlmann
Also introduced were Mrs. Harold B John
son, of Buffalo recording secretary of the State
Auxiliary, Mrs. Fred G Jones, of Utica, treasurer
Mrs. Walter A. Schmitz of Middletown, cor
responding scoretary Mrs. Edgar M Neptune, of
Syraouse State president-elect Mrs. Thomas E.
Bullard of Schuylerville first vice-president Mrs.
John J Rainey of Troy second vice-president Dr
V J Hicks of Middletown, president of the Orange
County Medical Society Mrs. Frederick R. Small,
of Newburgh, president of the Orange County
Woman s Auxiliary Dr Theodore Neumann, of
Central Valley chairman of the Orange County
Advisory Council, and Dr Harry F Pohlmann
Several past-presidents also were introduced

Several past-presidents also were introduced Mrs J Emerson Noll, of Port Jervis Mrs. Carlton Werts, of Buffalo, Mrs Edwin A. Griffin of Brooklyn and Mrs. Alfred L. Madden, of Albany

### Schenectady Auxiliary to Hold Legislative Meeting

DR. JOSEPH S LAWRENCE, director of the Washington office of the Council on Medical Service, will be guest speaker at the Legislative meeting of the Auxiliary to the Schenectady County Medical Society on Thursday evening, November 20, at the Van Curler Hotel in Schenectady His subject will be "Medicine a Political Football All County Auxiliary members and their hus-bands are invited to the meeting. Following Dr Lawrence's talk, there will be an open forum.

### THE GUILTY ANOPHELES

The scientific and medical world observed a significant anniversary on August 25 this year That date marked the fiftieth anniversary of the discovery by Sir Ronald Ross that malaria parasites were to be found in a mosquite s stomach and that mosquites (Anopheles) therefore, were wholly responsible for spreading malaria throughout much of the world.

Sir Ronald, who was to win the Nobel prize for his important discovery was just a medical officer with the British Army when he found the long sought answer to malarial infection at Secunderabad, India, August 25 1897 Many important scientists, doctors, and others had tried to determine the cause of malaria but it remained for an obscure, hard-working Army doctor buried in the Indian hinterlands to come up with the right answer after years of effort.

Sir Ronald, however did not stop his work on malaria with the discovery of the mosquito s part. He plunged into the problem of proper medication, being one of the first to determine the right dosages of quinine. He urged, in proneering fashlon, that schoolmasters and other public servants be trained in urging children and adults to take quinine regu-

## ABSTRACT OF MINUTES OF THE COUNCIL OF THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

AT ITS meeting on October 9, 1947, the Council considered various matters, taking action or directing further study and reports, as indicated under the following headings

### Secretary's Report

Remission of State Assessments—The remission of State assessments was voted on account of service with the armed forces for 1 member for 1948, 682 for 1947, and 76 for 1946, also on account of illness for Drs Robert F Schanz and John P Schneble

Meetings—It gave your Secretary great pleasure, with Dr J Stanley Kenney, to represent the Medical Society of the State of New York at the Annual Meeting of the Medical Society of the State of Pennsylvania, at Pittsburgh, September 19, 20, and 21 Since then I have also attended the meeting of the Seventh District Branch at Bath, and the Eighth District Branch at Jamestown on September 25 and October 1, respectively Also on September 20, with Dr Hannon, I was present at a hearing conducted by Senator Feinberg at Albany in regard to a proposal to establish a new medical school as part of the proposed New York State University Dr Hannon's statistics helped much to show the legislators how little there is need of an added medical college in New York State I have also attended committee meetings and have kept up with correspondence

Dental Associations—Liaison Committees—Dr George F Lull, secretary and general manager of the American Medical Association, in his letter of September 15, 1947, urges state and county medical societies to have liaison committees working with the corresponding dental associations. I wrote Dr Lull that our society has such a committee. Do you wish to urge similar committees in the constituent

county medical societies?

After discussion,

It was voted that Dr Anderton write to each county society suggesting that it might be well for them to have a joint committee with dentists

Communications—Dr Bauer stated he had received a communication from the United Medical Service, Inc., regarding a dinner at the Hotel Biltmore on November 19, as a means of public notice on the progress of prepaid medical care and hospital insurance. Dr Charles Gordon Heyd will be Charman of the dinner committee, and Dr Bernard M Baruch will be the principal speaker. The United Medical Service and the Associated Hospital Service requested that the Medical Society of the State of New York be a sponsor for the dinner, without cost

It was voted to sponsor the dinner

### Treasurer's Report was Accepted

### Report of Executive Officer

Dr Hannon reported that he had attended the meetings as mentioned by the Secretary in connection with the proposed State University Medical School and the three District Branch Meetings that have been held, the Seventh, the Fifth, and the Eighth

### Activities of Committees

Committee on Legislation—Dr H Aranow, Chairman, stated that he intends to call a meeting of the committee as soon as the District Branch meetings are completed

Subcommittee on Cult Practices and Subcommittee on Legislation —Dr Maurice J Dattelbaum, Chairman, reported that two matters had been referred to the Subcommittee on Legislation one on medical technicians and one on podiatrists, and they had reached the following conclusions

"For medical technicians a two-year course of instruction is sufficient if the schools that give such a course are authorized and approved by the proper authorities. A four-year course is not necessary, as there probably would not be enough students to take it. We are not opposing the four-year course as such, because we think that if there are any medical technicians that want a degree and desire to advance themselves, they should be encouraged to do so."

As to the podiatrists, at the committee meeting we were shown a catalog from the Long Island University. This has nothing to do with the Long Island College of Medicine. They are entirely separate and distinct organizations. At the Long Island University a four-year course has been in augurated for podiatrists. We found in the booklet the names of eminent specialists in Greater New York who are asked to give lectures there, so we felt a questionnaire sent to those lecturers would give us information as to whether we should or should not oppose the podiatrists' expanding the field of podiatry. In the proposition, the podiatrists are asking to be permitted only to treat systemic diseases, but we added the word "diagnosis" to make it read "the diagnosis and treatment of systemic disease." We feel the privilege of treatment should not be granted without their knowing something about diagnosis.

Dr Anderton has sent out this questionnaire, and he has some answers. All except one have stated that they feel the course in podiatry should not be four years. They all state that they have lectured at the Podiatry Institute on a few occasions at the request of the head of this Institute, without re-

muneration

Committee on Economics, Subcommittee on Medical Expense Insurance —Dr Carlton E Wertz, Chairman, referred to the following report of the Director of the Bureau of Medical Care Insurance

Director of the Bureau of Medical Care Insurance
September 20-23, 1947 Mr Farrell attended the
second Annual Conference of the Associated
Medical Care Plans at St Louis Recommendations
regarding all phases of the functions of medical care
plans were introduced by the special committees as
follows

Physician Cooperation

Barrett A Nelson, M.D., Chairman, reported that an analysis of problems was divided into the following factors

"1 The average physician does not understand how his own plan operates

"2 The fee schedule must provide satisfactory compensation for medical services rendered

"3 It is important that the administration of claims and payments to physicians be subject to medical interpretation

"4 The doctor becomes irritated with outside arrangements which tend to interfere with his

physician-patient relationships
"5 The feeling frequently arises that the plan
discriminates between urban and rural physi-

2472

cians

Lack of discipline in the ranks of the medi

cal profession Restrictions in contracts invite abuse and

"9 Economic conditions at the moment tend

misunderstanding "8 A minority element within the medical

profession are dishonest

to lessen the amount of real interest in the average medical care plan 10 Demand for osteopathic participation. "Ī1 Special consideration demanded by the

specialist groups.

12 The physicians' secretaries need to be

- plan. 13 Physicians' lack of understanding of the elementary principles involved in the field of medical economics.
- '14. Physicians fear that fee schedules will tend to reduce the level of fees in private prac-
- 15 Physicians object to a third party setting fees for medical service.
- 16 Little opportunity for training in medical economics afforded by the average medical school "17 Income limits for service benefits create confusion.
- "18. Many doctors resist any sort of inter ference with his private practice of medicine
- The doctor fails to read material which is 19 directed to him through the mail.
  - 20 Doctors resist paper work and forms Physicians often agree to participate in a "21

medical care plan as a choice between the lesser of two evils.

Doctors too often fail to appreciate the devicus, and sometimes subtle processes through which public opinion is formed The shaping and controlling of public opinion is a skilled art beyoud the reach of most men. Careless remarks with individual patients may ultimately be translated into adverse public opinion because individual patients belong to groups and the plan deals primarily with organized groups of enrolled persons. Lack of cooperation which is com-mitted innocently is the most difficult of all problems to eradicate.

Recommendation That AMCP initiate an adequately conceived study capable of probing beyond mere statements of fact which would result in the accurate determination of reasons causes underlying fears and explanations for the existence of facts which are observable but not thoroughly understood.

Departments of Physician Relations Established in Local Plans

Recommendation That AMCP seek to further establish of a Department of Physician Rela tions within each of its member plans.

"That the Director's office be instructed to proceed with preparation of a brochure which is the result of methods used in various plans and which might serve as a working tool to be used by AMCP member plans in the establishment of such departments—this brochure to be used for dis-semination of such information to the member plans and to which might be added, periodically results of studies initiated by this committee.

### Cooperation from Medical Societies

Recommendation The acceptance of the following statement of principle

"It shall be recognized that the responsibility for maintaining physician cooperation must be shared by plan management and the sponsoring medical society, that while management shall be held responsible for furnishing full information to the medical profession regarding its operations and development, the responsibility for gaining professional acceptance of the philosophy and principles of prepaid medical care shall rest essentially with the physicians and their organized societies and further, that the financial support of programs designed to pro-mote better physician relations shall also be shared.

#### Cooperation from the A.M A

"Recommendation That AMCP Commission encourage the Council on Medical Service and other offices of the A M A to continue active coopera tion toward furthering physician cooperation

#### Assistance from AMCP

"Recommendation That AMCP establish a list of qualified physicians, willing to accept speaking engagements on invitation of both plan management and sponsoring medical society

That AMCP prepare visual presentations of in formation, such as slides and filmstrips for use by member plans in furtherance of better physician relations that AMCP produce effective literature for use by member plans in distributing pertinent information to physicians that AMCP prepare exhibit material in such form as might be utilized by member plans in planning exhibits for medical society meetings etc and to furnish general field service in the development of physician relations programs and that a qualified person be added to AMCP staff for this work

### Case Procedure—Charles G Hayden M D Chairman

Standarduration of Statistical Data

Recommendation That it favors the accumu lation of experience data necessary for a scientific actuarial study

#### Recoprocity of Benefits

That the Committee ex 'Recommendations plore fully the Inter Plan Service Bank proposal currently being developed by Blue Cross Commission, to determine whether the basic proposal could be adapted to reciprocity of medical benefits that the following principles be observed

'1 Payments to physicians should remain identical to the fee schedule in effect in the plan with which physician is participating regardless of

fee schedule used by patient s home plan

2. The home plan should pay for services rendered at its own too schedule rate regardless of the fee schedule used by the plan in whose area service is rendered.

#### Employment of Medical Director

Recommendation That AMCP staff member be employed to work in the field of case procedure preferably a physician with proper qualifications and experience in medical care plan administra tion.

#### Enrollment Committee-Harley West Temporary Chairman

Recommendation from Reciprocity Committee That AMCP recognize the urgent need for a uniform contract to facilitate enrollment of national accounts"

### National Accounts

"Recommendation That AMCP give final approval and objectives be worked out cooperatively between AMCP and the Blue Cross"

### Community and Rural Enrollment

"Recommendation That AMCP commend and encourage the Council on Medical Service of AMA in establishing community health councils and that AMA Board of Trustees approve what the Council hoped to accomplish and that AMCP advise member plans regarding the Council's project as soon as Council receives official approval to proceed",

## AMCP Studies on Community and Rural Enrollment

"Recommendation That AMCP expand amount of information now on hand by conducting a thorough study of all aspects in community, rural, and individual enrollment"

#### Personnel

"Recommendation That AMCP make provision for adequate personnel to render service to its member plans in the field of enrollment"

### Research Studies—Jay C Ketchum, Chairman AMCP Depository of Studies

"Recommendations That AMCP circularize all sources, to determine what surveys, studies, or data had been developed, that such studies regardless of limitation be collected in Chicago office, catalogued and made available to member plans, that AMCP request tabulating sections in the new district organizations to work out uniform methods for maintaining minimum statistical information pertaining to membership which shall be kept by each plan.

That AMCP request the claims department sections in the new district organizations to work out uniform diagnostic and/or experience codes to be used by each plan in recording experience data, that accounting sections in district organizations work out uniform methods of financial reporting for use of plans in reporting to AMCP."

### Reciprocity—A. J Offerman, M.D., Chauman Membership Transfers

"Recommendation That the presently established Blue Cross Inter-Plan Transfer and Branch Office Enrollment Agreement be adopted immediately by as many AMCP member plans as possible Agreement in part is herewith reproduced

"(A) To accept as participants the paid-up subscribers from other medical service plans who establish residence in our enrollment area, without regard to local group enrollment requirements

regard to local group enrollment requirements "(B) To recognize the previous continuous enrollment period in another plan (or plans) as the basis for meeting any waiting period requirement for benefits in our plan

"(C) To accept branch office or local employed groups of out-of-town organizations, when smaller in number than regular minimum group requirements, provided enrollment of the home office employees is proceeding, or has been effected, through another medical service plan

"(D) To accept branch office or local employed groups of out-of-town organizations, which by numbers qualify under minimum group requirements at percentages of 50 per cent or more, waiving the enrollment percentage requirements of the local plan, provided enrollment of the home office employees is proceeding, or has been effected, through another medical service plan"

### National Enrollment

"Recommendation That AMCP recommends early and immediate attention to the problem of establishing a uniform contract for enrollment of national accounts, together, with uniform practices for billing and collecting and that the Committee's efforts be correlated with Blue Cross National Enrollment committee, and finally, that AMCP Enrollment Committee give consideration to the possibility of sharing in the support and cost of a national enrollment office in cooperation with the Blue Cross Commission."

### AMCP-Blue Cross Joint Committee—Frank Feitra bend, Md, Chairman

"Recommendations That Associated Medical Care Plans, Inc , establish Plan district organizations equivalent to the present Blue Cross districts,

"That AMCP and Blue Cross Plans work to-

gether on a district basis,

"That the committee refer, through the respective Directors of each, agenda items for the joint session of the AMCP and Blue Cross Commissions at St Louis"

The following recommendations of AMCP Public Relations Committee were considered

"I That the words 'Blue Shield' and the Blue Shield emblem be adopted as the official symbol of AMCP member plans, and that AMCP register the above-mentioned name and design with the U.S. Patent Office,

"2 That the Blue Cross Commission be requested to devote regular space in the Blue Cross Bulletin to news of nonprofit medical care plans, detailed arrangements to be worked out by

Directors of each Commission, and
"3 That Director of AMCP be requested to
proceed with the further factual investigation of
the publication of a National Health Magazine,
and that AMCP Commission be advised of the
proposal for such a publication and the Committee's action in that regard"

## Finance Committee—Norman M Scott, MD, Chairman

"Recommendation And the Commission approved, that the By-Laws of the Association under Chapter III, Section I, (a) be amended to read as follows

(a) Full Members Monthly rate of 1 mill per beneficiary covered by contracts in force, minimum \$10 per month, maximum \$500 per month

Recommendations by all committees were accepted by the AMCP Commission except the recommendation of the Finance Committee This report was amended to read as follows "Full Members—Monthly rate of 2 mills per contract per month on contracts in force, minimum \$10 per month, maximum \$500 per month."

In adopting the recommendations of the special committees the AMCP is taking a practical and con-

structive approach from a local to a national level in promoting voluntary nonprofit medical care plans

There are over forty medical cure plans approved for membership by AMCP and it is the recommendation of Mr Farrell that New York State Medical Care plans which have not done so apply for membership in order to participate in the benefits of membership and have a vote in the formation of its policies

September 20 1947 Mr Farrell attended the Seventh District Branch meeting of the Medical Society of the State of New York at Bath NY, and arranged at that time with the Legislative Com mittee of the Steuben County Medical Society to meet with them on October 9 1947 to discuss a report recommending endorsement of a medical care plan

The report was accepted

Committee on Questions on Ethics.-Dr James R. Reuling, Chairman reported that there had been referred to the Committee on Questions on Ethics material in regard to a suit instituted against the N 1 State Society of Pathologists by a commercial laborator. The pathologists desire to have the Medical Society of the State of New York participate in this action as they feel that the suit challenges all our organized groups

After discussion.

It was roted that the Council approve of having the Secretary of the Medical Society of the State of New York write to the Secretary of the pathologists organization and suggest to him that we have a joint committee to study mutual problems and to iron out any differences so that we could present a united front on the subject of medicine as a whole this Committee to be a Subcommittee of the Economics Committee

Hospital Association of NY and Medical Society of the State of NY , Joint Committee. - Dr Carlton E. Wertz Chairman reported that Mr Clearwater met with the Attorney for the Joint Council representing the specialists of pathology roentgenology, anesthesiology and physical therapy. He stated that there would be a meeting in the near future with the hospital group and thought it would be wise if we express certain broad principles, and then proceed to straighten out the association between the doctors and the hospitals He recommended that the Council accept the following principles with the idea that they will be broadened, enlarged and additions made

'(1) It is agreed that the practice of Pathology Anesthesiology Rocatgenology and Physical Therapy are medical services and the practice of

medicine

(2) That these specialties are so recognized
(3) That an equitable arrangement can be made between the individual hospitals and the doctors who practice these four specialties recog nizing the above principle, whereby the hospital may bill for services in the name of the person rundering them. (This can be done by inserting the name on the regular hospital billhead ic. Instead of Nay indicate Professional Services of Dr Roentgenologist, )

After discussion,

It was roted that we rolterate our approval of these principles relative to the four specialties as being the practice of medicine,

Committee on Office Administration and Policles.—In the absence of the Chairman, the Secretary reported verbally that the Committee had mot October 8 1947 and transacted routine business particularly as applied to the salaries of a number of employees

Planning Committee for Medical Policies .- Dr J Stanley Kenney Chairman reported that there were two things that were principally engaging the attention of the Committee at the moment-the resolution referred at the last meeting relative to the reorganization of the District Branches on the request of Rockland County and the Group Practice resolution which was referred back to the Planning Committee In this connection, there was to be a meeting the following day with Dr Dickinson, the bead of the Bureau of Economic Research of the American Medical Association, Dr Edward Cun niffe, Dr Kenney and several members from the Group Health Council

He stated he had attended in Chicago hat week a conference of the National Physicians Committee and thought it was one of the most extraordinary medical gatherings that he had ever attended New York State had at that meeting Dr Conrad Berens Dr Roy Henline, Dr Herbert Bauckus and Dr Kenney It was attended by about 162 physicians from the 48 states Alaska Hawaii and by some 40 dentists by the members of the Medical Service Foundation, their officers and board of directors the Trustees of the National Physicians Committee and many of the past and current officers of the American

Medical Association.

Committee on Public Health and Education,— Dr O W II Mitchell Chairman, reported as fol lows

September 16, 1947 Attended a meeting of the Council Committees on Public Health and Education and Legislation and the Joint Subcommittee on Physical Medicine held in New York City

October 8, 1947 In New York City attended a meeting of the Council Committees on Public Health and Education and Lonalation and tho Joint Subcommittee on Physical Medicine. The State Education Department was also represented at this meeting

October 17, 1947 In New York City attended a meeting of the Council Committee on Public Health and Education and the Subcommittee on Cancer Invited to attend this conference were some of the officers of the Medical Society of the State of New York and representatives of the State Department of Health.

October 21 1947 In New York City attended a meeting of the Council Committee on Public Health and Education and the Subcommittees on Maternal Welfare and Child Welfare. The Child Consulta tion Clinics and the proposed additional films on obstetrics for postgraduate medical education were considered at this conference.

Also on this same day in New York City, there was a conference of the Council Committee on Public Health and Education and the BCG Ad-

visory Committee

Invited to attend these meetings were some of the officers of the Medical Society of the State of New I ork and representatives of the State Department of Health.

Committee on Public Health -A meeting of the Joint Subcommittee on Physical Medicine Charles M Allaben, M.D Chairman—was held in New York City on September 16, 1947 Members of the Council Committees on Public Health and Educa tion and Legislation were present as were some of the officers of the Medical Society of the State of New York. The qualifications and licensing of physictherapists were considered at this meeting

result of the discussion, a tentative resolution was drawn up with reference to qualifications required of physical therapists in New York State, and referred to the Council for study to be taken up at a later meeting

Postgraduate Education -Postgraduate instruction has been completed in Cayuga, Nassau, Ostego,

Sullivan, and Warren counties

Postgraduate instruction has been arranged for and will be given in the following counties Broome, Clinton, Cortland, Jefferson, Ontario, Orange, Oswego, Schenectady, Schoharie, Seneca, Tompkins, and Wayne

Arrangements have been completed for a Teaching Day to be given in Monroe County on Novem-

ber 13, 1947

A request for a series of twelve lectures has been received from the Richmond County Medical Society When subjects and speakers are decided upon, the Committee will proceed with arrangements

The report was accepted

Subcommittee on Nutrition -Dr Bauer reported that he had had a telephone call from Dr Herman Hilleboe, State Commissioner of Health The Governor has appointed him chairman of a Committee on Nutrition to cooperate in the nationa food conservation program. He stated that Dr Hilleboe would appreciate having a subcommittee from the State Society under Dr Mitchell's Committee on Public Health and Education to co-operate with this general State committee After consultation with Dr Mitchell, he suggested the following names

Dr Norman S Moore, Chairman, 512 East

State Street, Ithaca
Edgar C Beck, M D, 333 Lanwood Avenue,
Buffalo 9, assistant professor of medicine and therapeutics, University of Buffalo, School of Medicine

Elaine P Ralli, M D, 138 East 36th Street, New York 16, associate professor of medicine, New York University, College of Medicine Norman Jolliffe, M D, 39 East 75th Street, New York 21, associate clinical professor of pre-ventive medicine, New York University, College of Medicine

It was voted that Dr Mitchell be given authority to designate a Chairman of the Subcommittee in case Dr Moore would not accept

Dr Anderton was requested to notify Dr Hilleboe that the State Society through its Council has appointed this Subcommittee on Nutrition Committee on Public Relations—Dr

Winslow, Chairman, read the following report

It is requested that the Council ask the Board of Trustees to appropriate for the use of the public Relations Bureau an additional sum of \$3,201 15 which represents emergency and unexpected outlays in the spring of 1947 for which there was no budgetary allowance

Expenditures of the Public Relations Bureau to date have been about equal to the proportionate budgetary allowance Therefore, unless this ad-ditional money can be obtained, it will be impossible to be in sufficient funds to publish phamphlets planned. They are

planned

A handbook descriptive of the activities of the Medical Society of the State of New York

Pamphlet describing the awards which were given at the 1947 annual meeting at Buffalo to 400 physicians who had practiced medicine for fifty years or more Photographs have been obtained

from practically all these men, and miniature bi The cost of printing ographies have been written this document, proposals for which have been re-ceived, will be \$3,275 00 We are already in receipt of many letters from these physicians inquiring when the document is to be published. They and their friends are looking forward to receiving it with great interest

Mr Thomas E Walsh attended district branch meetings at Bath, Utica, and Jamestown continued his investigation of the feasibility of speakers' bureaus in connections with these and other

field trips he has made

Releases regarding postgraduate education were sent concerning the activities of the Committee on Public Health and Education to newspapers in the following counties Clinton, Cayuga, Cortland, Nassau, Seneca, Tompkins, Warren, and Geneva Academy of Medicine

It was voted that the report of the Public Relations Committee be accepted, carrying with it the recommendation for an additional appropriation to the Board of Trustees

Committee on Publication -Dr George W Kosmak, Chairman, reported that the Publication Committee had had its regular meeting on October 8, 1947, and considered many routine matters

In view of the enormous amount of material on hand awaiting publication, both in the way of scientific papers, council matters, etc., the Committee deemed it desirable to increase the Journal by at least one additional form, and have secured the paper at the price of 141/2 cents a pound instead of

The question of certain advertising was discussed, and the Committee is proceeding with further studies to develop just what is meant by "undesirable and unethical advertising" as stated

at the last meeting of the Council.

The matter of Dr Thomas Halsted's advertisement was discussed, and it was decided to notify him that as this type of advertising is considered illegal, it will

have to be omitted from the JOURNAL

The Directory was discussed, and the next issue is ider way. Copies of the 1947 edition have been under way distributed to all members

Liaison with the Veterans Administration —Dr Herbert Bauckus, President of the Board of Directors of the Veterans Medical Service Plan of New York, Inc , reported that there had been a meeting of the Board on October 8, 1947, with representa-tives from New York State of the Veterans Ad ministration, including the new branch medical director, Dr Ethan Flagg Butler

"During the eleven and one-half months that the plan has been in operation, 188,961 authorizations were granted, for which the amount obligated was \$5,146,888 The amount of money actually paid, however, was about 20 to 25 per cent less authorizing physician allows an amount that is not always used

"There has been a considerable change in the handling of much of this work in that more and more of it has been diverted to the Veterans Administra-

tion clinics

"When this plan went into effect last September there were many veterans in need of treatment, and the Veterans Administration did not have the facilities or personnel to take care of them So they urged us to hurry our program, which we did In the month of October, which was the first full month last year, there were 11,000 authoriza tions and \$159,000 obligated, then it went up so

that in March there were 23 000 authorizations with \$643,000 obligated. Then it began to decrease the next month when there were 18,000 authorizations and the smallest amount we had was in August with 13,359 authorizations and \$320,000. That represents in part the fact that many of these veterans have been taken care of, and the case load should go down

"There is another thought about that and that is when this program eventually goes over into the Veterans Administration clinic care, which I think is bound to come it will be shown how much this cost originally under our plan and how little money they were spending for it two years later The obvious comparison to the public and their understanding will be that we have cost the Government a great deal of money in taking care of patients under this

"The reason I mention this point is that yesterday the former branch medical director stated several times that he thought that the clinic method of care had a superiority over our private care system. He is quite committed to that, and that type of leader ship, I think, has harmed a great deal the private care for the veteran in this State in the past year Furthermore he said that Veterans Administration will take care of all of neuropsychiatry in the New York area in the clinics beginning the first of January This is an order that he sent out just the other day For one thing it is going to be a great deal cheaper, some \$500,000 a year less than they figured will be the cost here in the metropolitan area. This branch is taking in the immediate metropolitan area and some of the outlying counties under the supervision of our Coordinator in this area. Dr. O Kane

I want to report to the Council that the panel of neuropsychiatrists taking care of these patients—about 600 of them are the active ones—have been told beginning October 1 no new authorizations will be made, and they should expect to have all private

care treatment terminated by January 1

Then there is another item you should know The American Medical Association has called a conference of representatives from all the states for November 6 in Chicago A program will be presented, and there will be representations from various groups in the states Many, I understand, are very dissatisfied with this program.

A Committee in the American Medical Associa tion having to do with the study of this veterans medical care problem is to meet November 5 American Medical Association, through its Council on Medical Service has charge of this and Dr McVay the Chairman has invited each state to have representation. At this mooting General Hawley will present the main topic in the afternoon.

There is one other thing I should mention. We renewed the contract with our Veterans Administration for another year, so that it has practically another year to run. It was renewed on the same terms as the old contract but in my opinion there have been many violations of that contract or at least in the tenor of them, so that it really does not matter so very much except for two things. One is the establishment of the proper fee schedule, and the other is that under this system the coordinators, the physicians who are employed to look after the quality of the work, have a very important job They have done a good job and we can be very proud of our accomplishments in caring for the veterana

The question of the fee schedule was discussed and Dr Butler thought that we ought to have a re-

vision of it, and that we ought to have two fee schodules in N Y State one upstate and one downstate There was also interjected into the discussion the idea of the National Fee Schedule which the Veterans Administration have put out as a sort of maximum fee schedule for all states

We stated that we had gone through this question of fees very thoroughly, and as far as we could make out the fee was all right and was the same as was usually charged by the private practitioner but that we would appoint a committee and again go over the entire ice schedule and talk with the Veterans Administration about it afterward We also stated that this fee schedule has been agreed to by the Veterans Administration It is the Veterans Ad ministration fee schedule as much as it is ours. We went over it many times with them, and we agreed to make revisions when it was shown by them that they were necessary In order to get the men to do the work we felt we should have this fee schedule as outlined, so when it comes to that question it is as much the obligation of the Veterans Administration as it is of the Veterans' Medical Service Plan of New

lork or of the physicians generally

It was roted that the Council go on record as

favoring one fee schedule for the State Committee on Workmen's Compensation -Dr

J Stanley Kenney submitted the following report.

Arbitration Proceedings Arbitration proceedings were held in Albany Utica, Rochester, and Buffalo

from June 24 to June 27, 1947

An increasing number of physicians who have signed arbitration forms and agreed to appear at the arbitration sessions have failed to appear We have made every effort to assure the attendance of physicians. In some instances where it was impossible for the physician to attend and our office was notified well in advance, we consented to represent the physician if it appeared that the necessary medical information could be obtained, and if the physician agreed in writing to abide by the results of the arbitration In spite of this we have noticed an increasing tendency on the part of certain physicians to fail to put in an appearance without notifying us Every effort should be made to impress upon physicians the importance and seriousness of arbitration proceedings and the necessity of their attend

Legislation The Bureau has prepared legislation to amend the Workmen's Compensation Law and to add to it for submission to the Committee on Legislation. It is hoped that this year legislation recommended by the Committee and approved by the Council will be ready for presentation as soon as the Legislature convenes.

Radiology An examining Committee in Radiology has been appointed in Albany to examine a candidate for radiologic rating from Albany County A radiologic examination will be held at New York University X ray Department on October 7 when five candidates will be examined

Chemung County Round Table Meeting Director acted as moderator at a round table discussion on Workmen a Compensation in Limits on September 17 1947 Among those participating in the meeting was the vice-chairman of the Workmen s Compensation Board Frank D Maurin, who subsequently sent the following letter to your Directory

It was a pleasure to have participated with you in the Workmen's Compensation Forum sponsored by the Chemung County Medical Society and for which you acted as moderator Such activity is most desirable and informative

"Kindly accept my congratulations upon your

efforts in this most worth while activity

"With warm personal regards, I am "
New Fee Schedule Your Director has received from the assistant counsel of the Workmen's
Compensation Board the following memorandum
concerning the interpretation of certain items in the
new fee schedule

new fee schedule

"With regard to the increased medical fee schedule that became effective June 1, 1947, the Advisory Committee in recommending the increased schedule to the Chairman, representative as you know of all parties in interest, had in mind that the increased fee should be applicable to those cases in which medical care began on or after June 1, 1947. Where a claimant did not receive any medical care before June 1, 1947, the increased fee schedule is applicable regardless of date of accident.

"In a case where treatment began prior to June 1, 1947, and a new doctor is called in after June 1, 1947, the old fee schedule nevertheless is applicable. Compared with the number of increased fees, these cases would be relatively few."

Anesthesia Fees. An anesthetist in Elmira was requested to pay to a hospital in Elmira, where he had anesthetized a workmen's compensation claimant, a fee to cover the cost of anesthetic drugs used. In answer to the physician's inquiry we have replied that there is nothing in the fee schedule which permits or directs a physician to refund any part of his fee for the cost of the anesthetic drugs supplied in the hospital. It has not been customary for the hos-

pitals to charge physicians for such drugs
According to a statement made by a member of
the Hospital Association Committee on Arbitration,
the fee of \$20 or \$15 which the hospital receives for
the use of the operating room includes the anesthetic
Furthermore, a physician is entitled to charge for the
use of drugs, biologicals, sera, etc., in addition to the
fee for medical service. For example, if a physician
uses tetanus antitoxin or penicillin, he charges his
medical fee plus the cost of the drugs used and it is

customary and in accordance with the fee schedule for the employer or insurance carrier to pay these charges. Therefore, physicians should be on their guard in allowing any refunds to the hospital for the use of anesthetic drugs. The employer is liable for all medical care, drugs, etc., and if the agreement with the Hospital Association for the use of the operating room does not include the providing of the anesthetics, then the employer or insurance carrier would be charged not only for the scheduled fee for the induction of anesthesia but also the cost of the drugs.

mduction of anesthesia but also the cost of the drugs Meetings Dr Kenney stated that during the summer he called on the chairmen of the County Society Workmen's Compensation Committees in Buffalo, Syracuse, Rochester, Ithaca, and Schenectady He was much impressed with the organization in Eric County He had two meetings with the Chairman of the Workmen's Compensation Board, and has an appointment for another meeting with her next week. Through Dr Bauer's kindness he attended the Pennsylvania State Society meeting. There he had an extensive talk with Dr Laverty of Harrisburg in connection with Workmen's Compensation in Pennsylvania.

One of the functions of our Committee on Work men's Compensation this year will be to try to effect a close huison with the individual counties and get them to comply with the provisions of the law, particularly as to the filing of reports

"There is an apprehension in certain parts of the state as to the extending activities of the Medical Practice Committee, which supervises the workmen's compensation work in four metropolitan counties. This is particularly true in Erie because they are not far from the one million population mark, and if they should cross it they would automatically come under that Medical Practice Committee

"I hope that this year in conjunction with our Legislative Committee something can be done to break down that, and legislation can be passed to abolish the Medical Practice Committee

World Medical Organization.—Dr Louis Bauer reported that the World Medical Association was organized last month in Paris, France

## DOCTORS-WE NEED YOUR HELP

Cards for next publication of the Medical Directory of New York, New Jersey, and Connecticut will be mailed to you about December 15, 1947

### REVIEWED

A Surgeon's Domain By Bertram M Bernheim, M D Octavo of 253 pages New York, W W Norton & Company, 1947 Cloth, \$3 00

Dr Bernheim describes the trials and tribulations of the surgeon from the training of the neophyte to the finished product Included are his own various experiences. He discusses his theories for the correction of the evils of medical practice. This volume may be of interest to the laity

RALPH WOLFE

Radiology for Medical Students By Fred Jenner Hodges, M.D., Isadore Lampe, M.D., and John Floyd Holt, M.D. Octavo of 424 pages, illustrated Chicago, Year Book Publishers, 1947 Cloth, \$6 75

This book admirably fulfills its purpose to supply medical students with all the knowledge a physician needs if he wishes to make the best possible use of diagnostic and therapeutic radiology. The book is mindful of the limitations and the dangers of the procedures. The text is concise, the language is clear, the illustrations are numerous and of superbiguality, the selection of the material is masterly. Its clarity, completeness, and accuracy render it highly recommendable to teachers and students alike.

S W WESTING

Pathology of Tropical Diseases An Atlas. By J E Ash, Col , (MC), USA, and Sophie Spitz, (MC), A U S Quarto of 350 pages, illustrated Philadelphia, W B Saunders Company, 1945 Cloth, \$8 00

This atlas covers those tropical diseases which are important from a military as well as a civilian practice. The authors stress the pathology of the conditions treated and present the material in a style which appeals greatly to the general pathologist. Despite its conciseness, the atlas is lucid and full of information of value not only to the pathologist, but also to the epidemiologist and clinician. The illustrations and diagrams are numerous and excellent. It is a prize volume for a medical library.

S. H. Polayes

Manson's Tropical Diseases A Manual of the Diseases of Warm Climates. Edited by Philip H Manson-Bahr, M D Twelfth edition Octavo of 1,068 pages, illustrated Baltimore, Williams & Wilkins Company, 1945 Cloth, \$12

This twelfth edition of so well-known and thorough a treatise on the diseases of the tropics should need no words of introduction or commendation to the medical profession. The book is profusely illustrated and the presentation of the subject matter leaves little, if anything, to be desired. The approach is clinical, but the discussion of laboratory aids to diagnosis is not neglected. Two chapters are devoted to consideration of "Life in the Tropics" and the criteria of physical fitness which should be methy those who contemplate working in tropical stations. The inclusion of these chapters seems worthy of note, since the subject not infrequently has been overlooked in other similar books.

[Continued from page 2480]

Postgraduate Obstetrics By William F Mengert, M D With drawings by Ruth Maxwell Sanders Octavo of 392 pages, illustrated New York, Paul B Hoeber, Inc , 1947 Cloth, \$500

The author reviews all phases of obstetrics, paying particular attention to those complications prone to confront the busy family doctor. Each subject is discussed in a thoroughly competent and concise manner. The ideas expressed are in keeping with a conservative, sane practice of obstetrics. The book is well printed, on fine paper stock, and the medical illustrations and photographs are well chosen, well rendered, and clearly reproduced.

Intrauterine douching to control postpartum bleeding or to remove any remaining fragments of a hydatid mole is no longer used in this region and one might question the advisability of recommending such a procedure to the casual intrauterine manipula-

This book fills a definite need for the busy general practitioner, bringing him in "capsule" form the current, accepted views on obstetrics

M GLASS

Gynecological and Obstetrical Pathology With Clinical and Endocrine Relations By Emil Novak, M D Second edition Octavo of 570 pages, illustrated Philadelphia, W B Saunders Company, 1947 Cloth, S7 50

In this second edition, the author has added the newer contributions to gynecologic pathology along with their references, thus bringing the book up to date. Occasional important correlations between pathology and symptomatology or therapy are included. The sections on carcinoma of the cervix and cyclical changes in the endometrium, Fallopian tube, and ovary are particularly complete and profusely illustrated. Recent contributions to our knowledge of the Brenner tumor and the feminizing mesenchymomas of the ovary are described in detail

Dr Novak's long experience as a gynecologic pathologist and teacher makes the text particularly valuable. The book is not encyclopedic. It should be of practical value to the student, clinician, and bacteriologist.

ALEXANDER H ROSENTHAL

Selective Job Placement. A Plan for Promoting Personnel Proficiency By Tobias Wagner, Ph D Octavo of 151 pages, illustrated New York, National Conservation Bureau, 1946 Cloth, \$2 50

The author summarizes extensive studies of comparative work-efficiency of physically disabled and normal persons in a wide variety of jobs in many industries and concludes that the performance of properly placed disabled people is as good or better than that of average employees

He contends that more selective placement procedure would increase greatly the job-effectiveness of all workers and he proposes a plan for ascertaining the individual differences of people and for determining the specific demands of every job to secure a

better balance between them

J J WITTMER

Free Medical Care Compiled by Clarence A Peters Duodecimo of 378 pages New York, H W Wilson Company, 1946 Cloth, \$1 25 (The Reference Shelf)

This short volume provides an excellent presentation of the arguments pro and con in the discussion of medical care, private and governmental, individual and cooperative. The "bricf" and the bibliography should prove valuable aids to the debater on the subject

BENJAMIN M BERNSTEIN

Military Neuropsychiatry [Res Publ Ass Nerv Ment Dis, Vol 25] Ed Bd, Col Franklin G Etaugh, MC, Chairman Octavo of 366 pages, illustrated Baltimore, Williams & Wilkins Company, 1946 Cloth, S6 00

This book comprises 32 chapters dealing with the emotionally sick servicemen of the second World War. It is a record which posterity may well consult in understanding the various forms of psychiatric disabilities that have occurred in the war, and may well be used as a guide for treating similar disorders arising in civilian life. It is a splendid book, dealing with an important subject, and will be of tremendous value for all who are concerned with the various forms of abnormal behavior, not only incliental to war but also found in civilian life. It is highly recommended

IRVING J SANDS

Diagnosis and Treatment of Menstrual Disorders and Sterility

By Charles Mazer, M D, and S Leon Second edition Octavo of 570 pages, illustrated New York, Paul B Hoeber, 1946 Cloth, \$7.50

This second edition is comprehensive. Although written for the family physician, it is difficult to see how it would help him, except for the excellent list of commercial endocrine products. Primary dysmen orrhea is the same old problem. Study of infertility is hardly a field for the general practitioner. The new chapter on the Rh factor and toxemia is very sketchy. The book is handsomely bound and well illustrated.

CHARLES A. GORDON

Dentistry An Agency of Health Service By Malcolm Wallace Carr, DDS Octavo of 219 pages New York, Commonwealth Fund, 1946 Cloth, \$1 50

Dr Carr has given us the first over-all survey of dentistry in the United States He presents the historic development of the profession, the educational status, going thoroughly into the prodental educational requirements and the postgraduate opportunities of hospital internship and residencies. The status of dental research, together with problems for investigation and current progress, are thoroughly outlined

This book will be of benefit to the dentist, the physician, and the layman who are interested in getting an authoritative view of dentistry

LAWRENCE J DUNN

Acute Injuries of the Head Their Diagnosis, Treatment, Complications, and Sequels By G F Rowbotham, B Sc (Manchester, Eng.) Second edition Octavo of 424 pages, illustrated Baltimore, Williams & Wilkins Company, 1945 Cloth, \$850

This treatise deals with the various lesions of the head that result from contact injuries of this structure. This includes scalp, skull, brain, and cranial nerves, the lesions of the brain occupying the important position in the discussion. In these considerations the patient has not been forgotten as

evidenced by chapters concerning the sequelae of head injury and the rehabilitation of those so injured. The author's style makes the book very readable. The subject matter is presented in a manner quite readily comprehended even though one does not possess a detailed knowledge of neural anatomy and physiology. This book is highly recommended to all those charged with the care of patients who have sustained craniocerebral injuries

JEFFERSON BROWDER

Introduction to Surgery By Virginia Kneeland Frantz, M D, and Harold Dortic Harvey, M D Duodecimo of 216 pages, illustrated New York, Oxford University Press, 1946 Cloth, \$2.50

This short text deals with the general principles of surgical practice. The pathology of injury, inflammation, and repair is presented. Degeneration, regeneration, hypertrophy, and atrophy receive attention. Various types of wounds in the skin, bone, and the viscera, and the principles in their handling are outlined. Although the book is called an introduction to surgery, it requires considerable knowledge and experience on the part of the reader to appreciate the full value of the material.

WILLIAM SHEINFIELD

How to Live Rules for Healthful Living Based on Modern Science By Irving Fisher, Ph D, and Haven Emerson, M D Twenty-first edition Duodecimo of 354 pages, illustrated New York, Funk & Wagnalls Company, 1946 Cloth, \$2 50

This book requires little additional review. It has already been introduced to the public in 20 previous editions, and since 469,000 copies have been sold, at least that number of persons know "How to Live". And yet through the ages, rules or no rules, man continues in many millions to roam over the surface of this planet.

Indeed, many more would continue to live a longer and happier life if the information contained in this volume could be made available to all. The doctor as well as the layman can profit by a careful perusal, in fact, some of the contents are sufficiently technical to belong almost exclusively in the domain

of the doctor

S R BLATTEIS

The Peripheral Circulation in Health and Disease A Study in Clinical Science By Robert L Richards, M D Octavo of 153 pages, illustrated Baltimore, Williams & Wilkins Company, 1946 Cloth, \$600

For those who wish to learn the exact value of skin temperature measurements in the extremities of man, this short monograph is made to order. Many cases are illustrated with histories, charts, and drawings in which accurate resting and post nerve block temperatures are made and their significance discussed. Disorders included are occlusive vascular disease, "Raynaud's Phenomenon," nerve injuries, and "immersion foot syndrome." There is a brief section on the technic of measuring skin temperatures. Although this is not a monograph on therapy, the rationale of such procedures as cold therapy is discussed with sound physiologic basis.

The monograph is written in the spirit of the late Sir Thomas Lewis and frequent mention is made of his work. Those interested in this limited field will

find it well worth their study

JOSEPH R DIPALMA

The Medical Clinics of North America. Chicago Number Octavo Philadelphia, W B Saunders Company, January, 1947 Published Bimonthly (six numbers a year) Cloth, \$16 net, Paper, \$12 net

As usual, the Medical Clinics for January, 1947, cover a wide field in practical medicine Radio-active phosphorus, nitrogen mustards, antibiotics, and antihistamine substances are covered in the early chapters. Infectious diseases, including a fine review of meningities, are covered in five sections. There is an interesting review by Katz on the electrocardiogram in heart strain. This volume is well worth careful study.

ANDREW M BABEY

The Principles of Neurological Surgery By Loyal Davis, M D Third edition Octavo of 540 pages, illustrated Philadelphia, Lea & Febiger, 1946 Cloth, 87 50

This is the third edition of an orderly and well-presented discussion of the lesions of the nervous system that lend themselves to surgical therapy. The author states that the book is written for physicians and students and modestly considers it to be of no help to experienced neurologists and neurologic surgeons. We are all physicians and students, and neurologists and neurologic surgeons could profit by

a critical perusal of the 532 pages

Following a somewhat abbreviated but precise and adequate presentation of neurologic diagnoses, consideration is given to all the commonly encoun tered pathologic states of the nervous system that may be cured or favorably modified by surgical methods. The discourse on tumors is especially creditable. Congenital and traumatic lesions, as well as lesions due to various infections, are appropriately considered. The text of this edition has been brought up to date.

JEFFERSON BROWDER

Pre-Frontal Leucotomy in 1,000 Cases Board of Control, England and Wales Octavo of 31 pages, illustrated London, His Majesty's Stationery

Office, 1947 Paper, 6d

This is a 25-page report of 1,000 cases of prefrontal lobotomies performed on 1,000 seriously ill mental patients, in various county and borough hospitals in England and Wales Since Dr Monz had introduced this operation in 1935, many similar operations were performed in this country and in England "The purpose of the operation is to sever the connection between the patients' thoughts and emotions, to take the sting out of the patients' experiences and to diminish their mental tension, and thus favor improvement of the mental disorders" The object of the operation is to cut the white matter connecting the prefrontal cortex and the thalamus When the operation is successful, the dorsal medial nucleus of the thalamus degenerates In general, the most difficult, chronic, and prognostically hopeless patients were subjected to this operation The results were gratifying, and were similar to the reports published in this country The report is a good summary of the subject

IRVING J SANDS

Emergency Surgery By Hamilton Bailey, F R. CS (Eng.) Fifth Edition. Octavo of 960 pages, illustrated Baltimore, Williams & Wilkins Company, 1944 Reprinted 1946 Cloth, \$18

The author has written a comprehensive volume on the treatment of surgical emergencies The text

is clear, concise, and profusely illustrated with

photographs, diagrams, and sketches

The chapters on the surgical diseases and complications of the abdomen and its contents are noteworthy Incidents in the author's surgical practice serve to illustrate methods of treatment. More recent advances in therapy make the chapters on burns, cellulitis, and carbuncles inadequate book is well written and can be recommended

RALPH WOLFE

Radical Surgery in Advanced Abdominal Cancer By Alexander Brunschwig, M D Octavo of 324 pages, illustrated Chicago, University of Chicago Press, 1947 Cloth, \$7 50

A physician who declares a patient "inoperable" often fails to realize his responsibility for a mortality higher than operation per se Brunschwig, presenting 100 cases of radical but discriminate surgery, with errors as well as triumphs, provides a basis for revaluating the term "inoperable"

This book is timely because of the recent tremendous advances in supportive therapy protein, electrolyte, and vitamin balance, chemotherapy, massive transfusions, modern anesthesiology, and operative skill. The frontier of reasonable operability has expanded

WILLIAM H FIELD

Cardiovascular Diseases By David Scherf, M D, and Linn J Boyd, M D Octavo of 478 pages, illustrated Philadelphia, J B Lippincott pages, illustrated Philade Company, 1947 Cloth, \$10

This volume is a brief presentation of cardiology and peripheral vascular diseases. Being bric covers certain important phases very sketchily Being brief, it ry sketchily To pregnancy and heart disease, for example, are allotted four pages, and to the cardiac patient who needs surgery, one page. It is useful as a ready reference or as a textbook for students

Andrew Baber

Urgent Surgery Volume I Edited by Julius L Spivack, M D Contributors, Gustavus M Blech, M D, Warren H Cole, M D, A M Doghotti, M D, et al Octavo of 714 pages, illustrated Spring-field, Illinois, Charles C Thomas, 1946 Cloth, \$10 50

This first volume is edited by Dr Spivack, whose contributions to surgery are many and well known. The emergent preoperative, operative, and post-operative treatments are explained in detail Diagnosis is discussed with illustrative cases, in some to further emphasize the individual instances, methods of handling various emergent problems

It should be noted that this volume deals almost entirely with emergent surgery of the abdomen, and is an excellent work for the intern, resident, and

general surgeon

HERBERT T WIKLE

Tutoring as Therapy By Grace Arthur, Ph D Octavo of 125 pages, New York, Commonwealth Fund, 1946 Cloth, S1 50

As the name of the book indicates, the author, a psychologist, describes the factors necessary for successful use of tutoring as therapy She refers to experiments with children in the first grade of school to indicate the necessity of private instruction for some, even though of normal mentality There may be a special disability, prolonged illness, or specific emotional problem which prevents the success of an individual child to learn in a group There are chapters on selection, training, and supervision of tutors, methods used in remedial teaching, and tutoring as therapy and as a community project

STANLEY S LAMM

Parenteral Alimentation in Surgery With Special Reference to Proteins and Amino Acids By Robert Elman, M D Octavo of 284 pages, illus-trated New York, Paul B Hoeber, Inc., 1947 Cloth, \$4 50

Great improvement in parenteral alimentation in surgery has taken place in recent years geons of today emphasize with justice the importance of the support which thus therapy lends to the welfare

of the patient

Dr Elman has covered the entire subject, beginning with the history of parenteral feeding, outlining the indications and elaborating on the need for water, electrolytes, vitamins, fats, carbohydrates, and proteins The author has presented in orderly manner all the useful factors involved in modern parenteral feeding. While some might claim that he has overstressed the value of the amino acids, this has in no way detracted from the usefulness of a The author deserves consplendid monograph gratulations, and the book should find a place in the library of every student of surgery

ROBERT F BARBER

Conduction Anesthesia Clinical Studies of George P Pitkin, M D Edited by James L Southworth, M D, and Robert A Hingson, M D With chap-ters prepared by Winifred Pitkin, M D, A. R. McIntire, M D, Frederick M Allen, M D, d al Illustrations prepared under the direction of Dr George P Pitkin Quarto of 981 pages, illustrated Philadelphia, J B Lippincott Company, 1946 Cloth, \$18

This excellent volume is the answer to all questions concerning new and old procedures in original

anesthesia

There has been a long-felt want for a book of this The sections on thoracic, sympathetic, lumbar, and sacral blocks are excellent The section on spinal anesthesia, although well done, could be more modern One detracting quality of the book is the poor location of the illustrations in regard to text, i.e., often there is a variation of five and six pages between the text and the accompanying illustration The illustrations are profuse, original, and clearly

This large volume has much to recommend it and should find wide use

F PAUL ANSBRO

A Textbook of Clinical Neurology By J M Nielsen, M D Second edition Quarto of 699 pages, illustrated New York, Paul B Hoeber, Inc., 1946 Cloth, \$7.50

This edition, despite the claims of the publisher, shows relatively little change as compared with the previous one. The author's presentation is refreshing in its chatty and informal style and makes easy reading. At times it is too discursive. The student who looks for a systematic and thorough account of a subject will not always find it here This book does not lend itself to teaching. It serves as an additional treatise which is useful because it is personal, and sometimes one runs across material not found in other texts.

The illustrations are clear and frequently good An excellent 10b is done of the makeup, the book is attractive and readable. The chapters have useful

bibliographies but the render is sometimes annoyed to find reference in the text to papers which do not appear in the bibliography. The proofreading has not been adequate. Some errors in punctuation noted in the first edition are still present in this one. The index in this edition has not been corrected for changes in paging. And to mention only one more shortcoming, the pinealoma is not even mentioned in the discussion of brain tumors.

I S FREIMAN

Five Million Patients The Professional Life of a Health Officer By Allen Weir Freeman, M D Octavo of 299 pages New York, Charles Scribner's Sons, 1946 Cloth, \$3 00

Five Million Patients is the biography of a physician as a medical student in a prominent medical school, as an intern in a large city hospital, a few years of private practice, then in the field of public health as a local, a state, and a Federal governmental officer, and at last reaching that goal of many physicians, an instructor and, finally, a professor at his alma mater

The title is rather misleading, as it would imply a private practice in which there was a personal contact with all these patients, whereas it deals with groups encountered in the activities of a physician carrying on medical and executive work in the field of public health. Physicians as well as the general

public will enjoy reading this book

C T GRAHAM-ROGERS

Concise Chemical and Technical Dictionary Edited by H Bennett Octavo of 1,055 pages Brooklyn, Chemical Publishing Company, 1947 Cloth, \$10

This book of over 1,000 pages contains about 50,000 definitions covering many fields of scientific and technical advances. There are numerous trade names and proprietaries, especially in the field of plastics. It appears to be a complete and handy reference book.

ANDREW BABEY

Uterine Contractility in Pregnancy A Study of the Contractions of Pregnancy and Labor Under Normal and Experimental Conditions By Douglas P Murphy, M D Octavo of 134 pages, illustrated Philadelphia, J B Lippincott Company, 1947 Cloth, \$500

The obstetric specialist will read this little book with great interest. It is a report of observations and conclusions of the author, in about 1,200 cases, in external hysterography of the pregnant uterus with use of the Lorand tocograph. Primary mertia is so important, and so little is known about, it that the reader will be stimulated. The discussion of morphine and pituitrin is of interest. The tocograph is said to measure the hardness of the uterine muscle, though this is debatable.

CHARLES A GORDON

Foods Their Values and Management. By Henry C Sherman Octavo of 221 pages New York, Columbia University Press, 1946 Cloth, \$3 25

In this work the author is much influenced by reports of United Nations Food and Agriculture Organizations, the Committee of Nutrition and Food Management, the United States Department of Agriculture, and the National Nutritional conference held in Washington, in May, 1941 He dis-

cusses food economics on a broad scale, food availabilities, and the contents of food essentials

It is a good book for lay information. For therapeutic references the physician can find better sources

MORRIS ANT

Hygiene A Textbook for College Students on Physical and Mental Health from Personal and Public Aspects By Florence L Meredith, M D Fourth edition Octavo of 838 pages, illustrated Philadelphia, Blakiston Company, 1946 Cloth \$4

Hygiene is covered by the author as it affects the individual and groups, the objects that arise from them, and what action is scientifically appropriate on the part of the layman, especially the college student. There is a vast amount of historic, factual, and scientific data which makes the contents in teresting as well as educational.

It is well illustrated and brings up to date the multiple contributions to hygiene for the public health officer and worker, and is especially invaluable to the student because of the thorough and comprehensive manner in which the subject is covered. It contains a splendid bibliography for

reference and is well indexed.

A JABLONB

Functional Cardiovascular Disease By Lt Col Meyer Friedman, USMR Octavo of 266 pages Baltimore, Williams & Wilkins Company, 1947 Cloth, \$3 00

The author chooses the title Functional Cardiovascular Disease for the syndrome previously described by different authors under such titles as "neurocirculatory asthenia," "the irritable heart," "the soldier's heart," and "effort syndrome". He presents several interesting original clinical observations to show that the condition is probably due fundamentally to cortico-hypthalamic imbalance with hypothalamic dysfunction and "cortical recession". This reviewer agrees with the hypothesis and believes, therefore, that a title such as Neurogenic Cardiovascular Disturbances would be more appropriate for the monograph. The complete review and discussion of the available literature by the author are very valuable. There is, however, considerable repetition of the subject matter in the various chapters, which leads to some confusion. In general, the monograph is a valuable contribution.

Your Rheumatism and Backaches By Joseph D Wassersug, M D Duodeeumo of 310 pages New York, Wilfred Funk, 1947 Cloth, \$2 50

In the present age of scientific reporting and exact measurement, the paternal, pleasant, and only mildly informative book is dubbed "lay" reading. To popularize an organized interpretation of a difficult subject in a comprehensive, simple, and informative manner should be the aim of the writer for the nonprofessional group. Too often the public is given "anything" in place of "something." The theory is that since no professional reader will criticize, an accurate evaluation of the field is unnecessary.

Rather than this book, the public needs a critical interpretation of the field of "rheumatism". As a hook to persuade people to go to the doctor to have blood tests, x-rays, etc., it may well serve a purpose

Neurosis and the Mental Health Services ByC P Blacker, M D Octavo of 218 pages New York, Oxford University Press, 1946 Cloth, \$5 00 New

This book deals with the results of a survey of the psychiatric outpatient facilities of England and of Wales, and is based upon the returns of a questionnaire which asked for figures for the years 1938, 1940, 1941, and 1942 The immediate purpose of the survey was to bring about a better coordination and distribution of the country's psychiatric facilities which had been depleted by the needs of the fighting The ulterior purpose was to effect an integration of the psychiatric resources into the general health service of the nation

It offers a plan for an "ideal" setup for the care of the psychiatric, outpatient, people in a population of one million. The book will be found helpful to all psychiatrists and especially to those who deal with the administrative aspects of the care of the

psychiatrically sick

IRVING J SANDS

The Eye Manifestations of Internal Diseases By S Tassman, M D Second Edition St Louis, C V Mosby Company, 1946 Cloth, \$10

The second edition of "The Eye Manifestations of Internal Diseases" by I S Tassman, so soon after the appearance of the first edition, is very good evidence that the book has been of decided value to the medical profession He has added descriptions of numerous diseases and a number of new illustra-One of the characteristics of the war years has been the presentation of such entities as Hurler's disease, Bowen's disease of the cornea, toxoplas-

mosis, etc
Dr Tassman acknowledges the many sources from which he has drawn material and illustrations for

the book

JOHN N EVANS

The Crusade Against The Challenge of Polio Infantile Paralysis By Roland H Berg Octavo of 208 pages New York, Dial Press, 1946 Cloth,

This little book is rightly titled. Polio is still a challenge, here we are told much of what has—and, more truly, has not—been accomplished in the fundamental prevention and cure of this very serious It also reports progress in treatment and is fair to those who have offered "specifics" which failed and to those presenting treatments of symptomatic value

Berg in his personal "note" says Yet Dr "Nothing that medical science can do can prevent one case or one epidemic from occurring" And Mr O'Connor in his introduction quotes "No preven-O'Connor in his introduction quotes tive, no cure "

The challenge must be met

W D LUDLUM, Sr

Intracranial Arterial Aneurysms By Walter E Octavo of 147 pages, illustrated Ithaca. Cornell University Press, 1944 Cloth \$2 50

This is a 147-page monograph, well-illustrated and appended charts, based on a study of 108 patients with 133 aneurysms, all verified by either necropsy or operation Many new facts have been presented, particularly with reference to the therapeutic approach Essential details are recorded relative to surgical procedures designed to cure these lesions Certainly the author made great studies in this un-explored field of surgical endeavor This book should

serve as a great stimulus for well-trained and enterprising neurosurgeons In addition, it is an excellent account of the variations in the arteries supplying the brain and the locations of the ancurysms arising therefrom

JEFFERSON BROWDER

Demonstrations of Physical Signs in Clinical Surgery By Hamilton Bailey, FRCS (Eng.) Baltı edition Octavo of 375 pages, illustrated more, Williams & Wilkins Company, 1946

The text starts with a discussion of basic physical Swellings, fluctuation, edema, translumination, and other phenomena are demonstrated. In flammations, ulcors, and sinus tracts are pictured, the more common clinical conditions being shown

The chapters then are arranged on a regional basis, the mouth, face, neck, head, extremities, abdomen, chest, etc., being considered in turn Im portant findings and methods of cliciting these are given. The general principles of physical diagnosis are stressed In addition many illustrations of specific diseases are shown. The text is also a fine compilation of the most common syndromes or diseases encountered by the general surgeon.

WILLIAM SHEINFELD

By Joseph Earle Moore, Penicillin in Syphilis M D Octavo of 319 pages, illustrated. Sprinfield, Ill, Charles C Thomas, 1946 Cloth, \$5.00

This informative monograph on penicillin in syphilis is intended to supplement the author's larger and earlier volume, The Modern Treatment of Syphilis

Penicillin dosage schedules for syphilis are analyzed in terms of successes and treatment failures. The various toxic manifestations are explained in detail with special reference to the Jarisch-Hercheimer reaction The interpretation of serologic tests in patients previously treated with penicillin for purposes other than syphilis and the evaluation of serologic reversibility following therapy are both discussed in an enlightening manner

The bibliography and author index are complete. The book is actually a pooled, cooperative undertaking of 44 groups and clinics in the United States, including the Army, Navy, and Public Health centers, and should be most useful to venereologists

and dermatologists

LEO LOEWE

Technique of Psychoanalytic Therapy By Sandor Lorand, M D Octavo of 251 pages New York, International Universities Press, 1946 Cloth,

Dr Lorand is an experienced and popular teacher, lecturer, and practitioner of psychoanalysis He has published several books and numerous articles dealing with the subject This book is based upon the material for a course for psychiatrists who are students in the last year of analytic training It covers the entire subject of psychoanalytic therap) from the first interview with the patient to the termination of the analysis It contains numerous hints and suggestions as well as some positive instructions in the methods of dealing with different patients and with the problems that arise during the It is a useful book which will find course of therapy a warm welcome by all who are interested in the subject It is highly recommended.

#### SUGGESTIONS FOR CONTRIBUTORS TO THE NEW YORK STATE JOURNAL OF MEDICINE

The New York State Journal of Medicine asks its contributors to follow the suggestions listed below in the preparation of their articles way they will greatly facilitate the expeditious publication of the Journal. These suggestions have - been devised in order to save correspondence, avoid return of papers for changes, minimize the work of preparation for the printer, and save the high costs of corrections made on galley proof

 Size of Articles.—It is earnestly desired that - scientific articles shall not exceed 6 Journal pages at the outside Longer articles tend to lower reader interest. An average of five or six seems to be the most desirable from this point of view Calculation can readily be made by multiplying the number of double-spaced typewritten manuscript pages by the fraction two-fifths, e.g., twelve manuscript pages will make five Journal pages

Manuscripts.—Papers must be typewritten on one side only of white sheets consecutively numbered, and be double spaced with one-inch margins They should be prepared with great care so as to be All headings, titles, subtypographically correct titles, and subheadings should be typed flush with the left-hand margin. This is imperative for rapid

and accurate composition by the printers

Titles.—The title should be brief and typed in - capital letters The subtitle can be longer and should be typed in caps and lower case letters Under the title, or subtitle, if there is one, should appear the name of the author and city in which Directly under his name should be the he lives hospital or institution with which he is affiliated

Subheadings.-Subheadings should be inserted by

the author at appropriate intervals

References -It is the unfailing practice of the NEW YORK STATE JOURNAL OF MEDICINE to use specific "references" rather than "bibliography" There should appear in the text reference numbers, typed above and to the right of the word to which there is a reference A list, consecutively numbered, of these references should follow at the end of the (Note that spelling in list is same as in The arrangement should be as follows and should include all Items

Books—author's surname followed by initials, title of book, edition, location and name of publisher, year of publication, volume, and page number Thus, Osler, W Modern Medicine, 3rd ed, Philadelphia, Lea & Febiger, 1927, vol 5, p 57

Periodicals author's surname followed by

minuals, name of periodical, volume pages month (day if necessary), year of publication. Thus, Leahy, Leon J New York State J Med 40 347 (March 1) 1940

The JOURNAL does not include titles of Note , " T. " M" , " EE articles

Case Reports.—Instead of abstracts of hospital histories, authors should write these reports in a narrative style with properly completed sentances. All unimportant details should be deleted with such general negative statements as fit the case"

Tables.—While tables are very useful on lantern slides in the reading of papers, they fail of this purpose to a large extent in the printed page \ For that reason it is urged that they be reduced as much as possible to descriptive language 14

Illustrations.—These should be kept to the minimum necessary to make clear the points to be registered by the author In some instances they are imperative to proper understanding, in others they are merely picturesque. The latter can be excluded to good effect, both as to space and the not

inconsiderable cost.

When illustrations are to be used they should accompany manuscripts and each should always be referred to in the text, preferably by number Drawings or graphs should not be larger than 12 X 16 inches, and must be made with jet black India n white paper Do not use typewriter for letter.

The smallest lettering on 8 × 10 inch copy. ink on white paper should be no less than 1/4 inch high Cross-section; paper (white with black lines) may be used, but should not have more than 4 lines per inch I finer ruled paper is used, the major division lines should be drawn in with black ink, omitting the finer In the case of finely ruled paper, only blue-lined paper can be accepted Lettering and all markings must be large enough to be readable after reduction Mail rolled or flat, never fold. Photographs should be very distinct and show clear, black and white contrasts They must be on glossy white paper Avoid round and oval photographs.

Whenever possible "crop" photographs, i.e, market portion that can be excluded when reproduced to the contrast of the cont

Crop marks should be on margin of photographs

Do not run pencil lines through photographs It is important to mark the top of the illustration on the back, also its number as referred to in the text, thus, Fig 1, 2, and the name and address of the author

Legends should be typewritten on one sheet of paper and attached to the illustrations

## We Share with You the Care of Your Patient

Here at the Spa, the care of your patient conforms to a medical guidance which you, yourself, have initiated

Capable physicians are available in Saratoga Springs for consultation with your patient on the details of the program

Surrounded by modern facilities for his treatment, your patient receives the benefit of your continuing medical direction in the care of circulatory and rheumatic disorders of a chronic nature

In peace and quiet, a sick person achieves the mental and physical relaxation that gives full scope to the restorative powers of the Spa's famed waters

#### "PHYSICIAN, GIVE HEED TO THINE OWN HEALTH"

Many physicians have come to the Spa for the same kind of treatments that have helped their patients here After a restorative cure" at the Spa, you, too, will return to your practice refreshed—revitalized—ready for the busy days that he ahead

For professional publications of the Spa, and physician's sample carton of bottled waters, with their analyses, write W S McClellan, M D, Medical Director, Saratoga Spa, 155 Saratoga Springs, New York

Listed by the Committee on American Health Resorts of the American Medical Association

for patients who expect MIRACLES

The prompt relief from hemorrhoidal pain and inflammation afforded by ANUSOL'\* Hemorrhoidal Suppositories does seem miraculous Some patients, however, expect even greater miracles: as soon as they are symptom free, they expect to keep their new found comfort without any further attention

These people truly believe in miracles; they forget that the cause of their hemorrhoidal trouble has been a series of repeated tissue insults over a period of time and that it takes more than a day or two to treat such disorders properly

Advise them to continue the use of 'ANUSOL' for several weeks: it's a good insurance against recurrence

Sig.: Insert one suppository after each bowel movement and at bedtime. Continue treatment daily for four weeks.

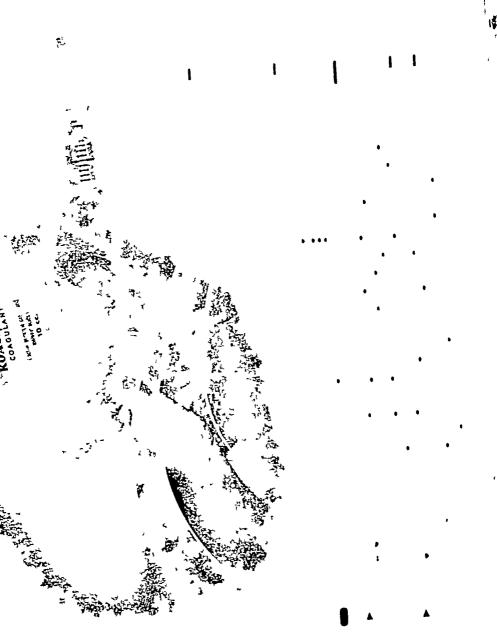

Anusol'

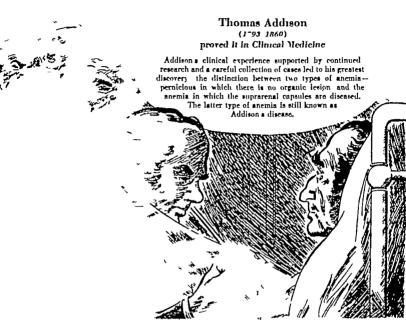

ANUSOL Hemorrhoidal Suppositories make pattents comfortable quickly without the use of optates, or local anesthetics. Their soothing pain relieving effects are due entirely to efficient reduction of inflammation and congestion; they cannot mask serious rectal disorders.

PACKAGING Boxes of 6 and 12 suppositories

#### Yes! And experience is the best teacher in smoking, too!

D'URING the wartime eigerette shortage, people smoked—and compared—many different brands any brand they could get That swhen so many people learned the big differences in eigerette quality Aud, out of that experience, more and more smokers found that

Camels suit them best. As a result, more people are smoking Camels than ever before!

Try Camels! Let your 'T Zone" your taste and throat—tell you why with millions who have tried and compared Camels are the choice of experience

According to a Nationuide survey

# a Parkinsonian State Merapy Stramonium Pills (Davies, Rose)

These pills are engaging increased interest in neurological clinics as well as in private practice, especially in the treatment of the *Sequelae of Epidemic Encephalitis*. They embrace the full therapeutic properties of the drug in a form convenient for administration.

Each pill exhibits 0.16 Gram (2½ grains) of the dried leaf and flowering top of Datura Stramonium, alkaloidally standardized, and therefore contain 0.4 mg (1/100 grain) of the alkaloids in each pill

Sample for clinical test and literature mailed upon request-

## Octin - for Relief of Smooth Muscle Spasm

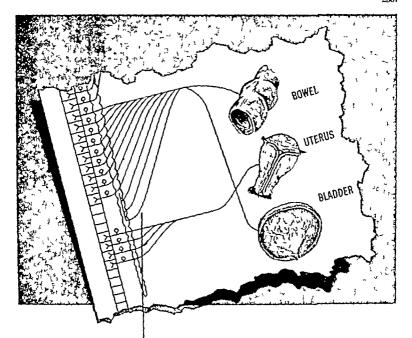

Octin is an antispasmodic, indicated for the treatment of spastic conditions, particularly of the genito-urinary and gastrointestinal tracts

TABLETS - 2 grains Octin mucate
ORAL SOLUTION - 10% aqueous solution (1½ grains per cc.)
AMPULES - 1 cc (1½ grains Octin hydrochloride)

Octin (methyllsooctenylamins) Trade Mark Blibuber

BILHUBER-KNOLL CORP, ORANGE, N J

when pain is caused by spasm

In smooth muscle spasm—gastrointestinal spastic states, primary dysmenorrhea bladder spasm—whether of neural or muscular origin relief may be obtained with the effective synthetic antispasmodic, Payatrine

#### PAVATRINE

(B-diethylaminoethyl fluorene 9-carboxylate hydrochloride)

#### with Phenobarbital

—Is both neurotropic and musculotropic in its ability to relax smooth muscle spasm. It is non-narcotic.

The dual relaxing effect is exerted on sphincters (cardiac, pyloric, sphincter of Oddi) bowel uterus and bladder with an accompanying relief of pain in spassic conditions of these organs.

Paratrine is the registered trademork of G. D. Segrie & Co., Chicago 80 Wheels.

#### SEARLE

RESEARCH IN THE SERVICE OF MEDICINE

THE season of throat affections is here

Thantis Lozenges have proved especially effective in soothing and relieving these conditions. The effectiveness of Thantis Lozenges is due to two active ingredients.

Merodicein\* an antiseptic which prevents the development of bacteria even in great dilution

Saligenin† a mild local anesthetic which relieves the discomfort of throat infections

Thants Lozenges are antiseptic and anesthetic for the mucous membranes of the throat and mouth Complete literature on request.

Supplied in vials of twelve lozenges each

- \* Merodiceln is the H W & D trade name for monohydroxy mercuridifodoresorcinsulfonphthalein-sodium
- † Saligenin is ortholy droxy benzy lalcohol H W & D

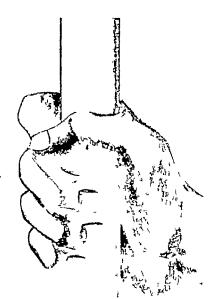

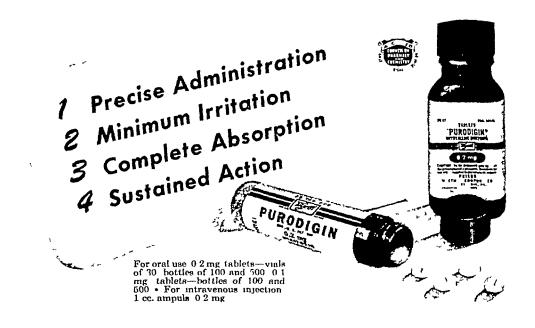

HYNSON, WESTCOTT & DUNNING, Inc. Baltimore 1, Md.

break the grip of an asthmatic attack

Purodigin has these advantages

PRECISE DOSAGE Purodigm (Digitoxin Wyeth) is absolutely uniform standardized by weight, prescribed by weight

LACK OF IRRITATION Purodigin is concentrated—dosage is only one thousandth that of digitalis leaf Nausea is rare

ABSORPTION of Purodigin is virtually complete Almost no irritating residue is left in the digestive tract SUSTAINED ACTION Purodigin remains in the body as long as digitalis

Try Purodigin—especially for those patients who do not easily tolerate digitals leaf Without interrupting treatment, simply prescribe 0 1-0 2 milligram Purodigin in place of 0 1-0 2 gram digitals

## PURODIGIN° CRYSTALLINE DIGITOXIN

## Formulac— a modern infant food

FORMULAG Infant Food is a concentrated milk in liquid form for tified with all vitamins known to be necessary to adequate infant nutrition. No supplementary vitamin administration is required.

By incorporating the vitamins into the milk itself the risk of human error or overnight is reduced Formulan contains sufficient B complex, Vitamin C in stabilized form Vitamin D (800 U S P units) copper manganese and easily assimilated ferric lactate—rendering it a flexible formula basis both for normal and difficult feeding cases. The only carbohydrate in Formulan is the natural lactose found in cow's milk. No carbohydrate has been added

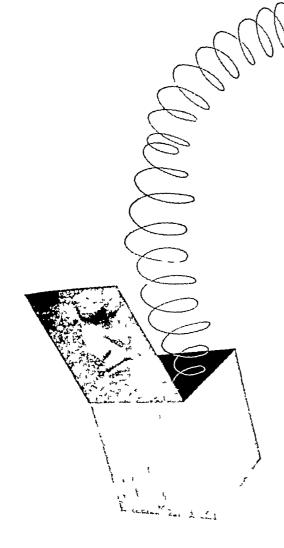

FORMULAC a product of National Dairy research has been tested clinically and proved satisfactory. It is promoted to the medical profession alone FORMULAC is on sale at grocery and drug stores nationally.

Distributed by KRAFT FOODS COMPANY

## Better Prognosis In Chronic Hepatitis

7 YEARS PROGRESS—

1940 Writing on the prognosis of chronic hepatitis Meakins\* says
" in the latent stages prognosis is good, but in the more advanced stages fatal accidents and a progressive depreciation can be expected"

1947 The results of years of intensive study of the relationship of dietary factors to hepatic dysfunction are summarized by Patek\*\*

" It is no longer justifiable to accept cirrhosis as a disease with a relentless downhill course. A significant number of patients with severe liver failure and a much larger percentage with moderate liver damage can recover with dietary treatment."

The lipotropic factor, Choline, plays a vital role in the dietary management of chronic hepatitis. The prevention or prompt reversal of fatty infiltration of the liver favors the maintenance of normal portal circulation, the regeneration of functional liver tissue and the restoration of adequate liver function

Syrup Choline Dihydrogen Citrate (Flint) a stable and completely palatable form of choline, is indicated in conditions in which hepatic dysfunction may be associated with impaired lipid metabolism

Syrup Choline Dihydrogen Citrate (Flint)

—25 Per cent w/v—is supplied in pint
and gallon bottles

TO PHYSICIANS WHO SMOKE A PIPE: We suggest an unusually fine new blend -- COUNTRY DOCTOR PIPE MIXTURE Made by the same process as used in the manufacture of Philip Morris Cigarettes.

## A Practical Penicillin Package for the Emergency Bag

The problem of carrying penicilin in the emergency bag is at last solved by the con-

venient, small box of Soltabs illustrated

Soltabs are soluble tablets of penicillin (50,000 units each), free of binder or excipient. They are sterile, dis

solve readily in water or saline solution, require no refrigeration

The Soltab package occupies but little space
in the emergency bag. Soltabs serve advantageously to initiate
parenteral penicillin therapy when the patient is first seen
in the home. They may also be used to give penicillin
parenterally prior to oral penicillin therapy.

Available in boxes of five 2 cc size serumtype vials, each vial containing 2 Soltabs or 100,000 units Crystalline Penicillin G Potassium

### on parental patience

Parents have enough problems without adding that of administering a vitamin preparation to recalcitrant offspring. It's no wonder Abbott's Vi Daylin has been so popular with mothers and fathers. Small patients like the lemon candy taste and fresh citrus fruit odor of Vi Daylin. Mother needn't beg or bribe to get the child to take it directly from the spoon—or it can be mixed with milk, fruit juice or cereal. Vi Daylin is not heavy or bulky, leaves no fishy odor on hands or in the refrigerator. One daily serving of Vi Daylin provides adequate vitamin supplementation for the average infant or child. For children up to 12 years of age a single teaspoonful (5 cc.) of Vi Daylin supplies twice the minimum daily requirements of vitamins D and C and thismine, the full minimum requirement of vitamin A and supplemental amounts of riboflavin and nicotinamide. Vi Daylin is especially suitable for infants since it is virtually free of alcohol (less than 0.5%). On your next prescription for a multiple vitamin product, please your little patients and their parents by specifying. Vi Daylin—available at prescription pharmacies everywhere in 90 cc. and one pint bottles. Abbott Laboratories, North Chicago, Illinois

(Vitamins A, B1, C, D, Riboflavin and Nicotinamide in palatable liquid form)

# ▼ improved diuresis

**◄** with Mercuhydrin

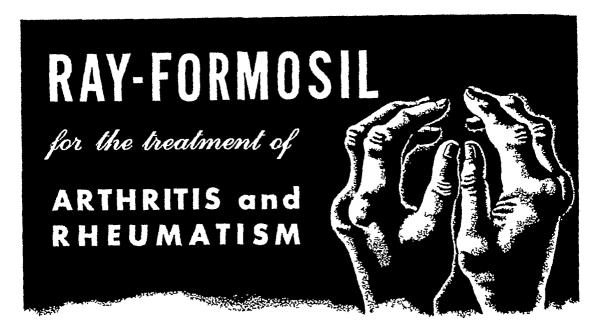

With the introduction of more effective mercurial diurens the xanthine derivatives at hat have achieved a more satisfying role in the treatment of cardiac decompensation. In this new role they serve as adjuncts to mercurial dimesis. In combination with the mercural, "theophylline enhances the rate and completeness of absorption so that the drug (mercural) is effective and well tolerated by intramuscular as well as intravenous administration.\*\*\* Theophylline also increases

glomerular filtration so that the effect of the mercurial in inhibiting tubular reabsorption may provide the greatest water loss. Mercuhydrin combines mercury and theophylline as the sodium salt of methoxyoximercuri propylsuccinvlurea theophylline. As well tolerated by muscle as by vein-therefore adapted to modern, sustained dosage schedules in treatment of cardiac decompensation-Mercuhydrin obtains uniform "dry-weight" levels of body fluid -avoids intermittent exhausting bouts of edema.

fluid sulfactiozine

for oral use

Smith, Kline & French Laboratories, Philadelphia

# If you are still using the leaf preparations

The routine use of Digitaline Nativelle in the treatment of congestive heart failure offers advantages to both the physician and patient. When rapid digital lation is desirable oral administration of two doses of 0.6 mg, at an interval of 3 to 4 hours produces the desired effect in 6 to 10 hours. Nausea and vomiting are virtually absent on this plan.

Digitaline Nativelle offers the further advantage of absolute uniformity of potency permitting dosage determination on the basis of weight of drug. The initial digitalizing dose of Digitaline Nativelle is 1.2 mg, given in equally divided doses at an interval of 3 to 4 hours, maintenance is readily effected on 0.1 mg, to 0.2 mg, daily depending upon individual response and physical activity.

Digitaline Nativelle is the chief active glycoside of Digitalis purpures 95 per cent pure digitoxin. It reproduces in all respects the cardiotonic action of whole leaf digitalis on the myocardium. Specifically indicated in congestive heart fail ure auricular flutter auricular fibrillation.

To insure your patients receiving the original Council Accepted digitoxin Lindly specify Digitaline Nativelle on your prescriptions

Physicians are invited to request a complimentary copy of brochure. The Management of the Falling Heart' and a sample of Digitaline Nativelle sufficient to digitalize one patient.

#### How Supplied

Digitaline Nativelle is available through all pharmacles in 0.1 mg, tablets (pink) and 0.2 mg, tablets (white) in bottles of 40 and 230, and in ampules of 0.2 mg. (1 cc.) and 0.4 mg. (2 cc.) in packages of 6 ampules and 30 ampules.

#### Dr Louis Bauer Tells the Facts

At a time when it is sorely needed, a straightforward, factual, and well written book, Private Enterprise or Government in Medicine, by Louis Hopewell Bauer, A.B., M.D. F.A C.P. comes from the press of Charles C Thomas, Springfield, Illinois. Dr Bauer, a Trustee of the American Medical Association, President of the Medical Society of the State of New York, Diplomate of the American Board of Internal Medicine, writes from an exceptionally well-informed background of long service to organized medicine and an intimate knowledge of his subject.

Clearly and concisely he presents the facts which should be the tools for intelligent argument, rational debate, and constructive thinking as to whether private enterprise shall continue to exist in medicine or be entirely replaced by government agencies The background of the problem is discussed, then the deficiencies of our present system of medical care are frankly stated

Next, the facts concerning the present health conditions in the United States are Selective Service statistics and their real or nonpolitical significance to the health of the nation

dealt with, and the distribution of physicians and hospitals, care of the indigent, the

Other chapters deal factually with foreign medical systems, compulsory sickness insurance in the United States, the development here of voluntary insurance systems, the programs of the American Medical Associa tion, and recent proposed legislation such as the Fulbright-Taft Bill (S 140 of 1947) and the Taft-Smith Ball Donnell Bill of 1947

Here is a most useful handbook with an extensive bibliography, clearly expressed and covering the entire field of controversy between the advocates of private enterprise in medicine and those who support compulsory sickness insurance

As Dr Bauer says in his preface "Propaganda has poured forth in an unremitting The subject which should be con fined to the field of medical economics, has become a political football. The public. which, eventually, must decide the question has not been given all the facts. The public wants to know both sides of the question '

Recent evidence in House Report No 786, referring to the so-called "health workshops," seems to show the use of government funds in an improper manner for propaganda activities supporting compulsory national health insurance. It would appear that "a key group on the govern-

used the workshop method ment payroll, of discussion subtly to generate public sentiment in behalf of socialized medicine" Within certain agencies of government, Dr Bauer notes, for example, there were prepared, according to the House Report noted above, certain "pamphlets and propaganda literature for the CIO, the AFL, and the Physicians' Forum, much of which material supported socialized medicine in every approach and dismissed contemptuously all arguments controverting the fixed position of the Social Security Board" Dr Bauer adds this recent material as an example of some of the propaganda devices which have been employed to generate public sentiment favorable to socialized medicine

The book is dedicated to Dr Nathan B Van Etten, former President of the American Medical Association and to Dr Olin West, for twenty-five years Secretary and in 1946-1947 President-Elect of the American Medical Association It should be in the hands of every doctor of medicine, for contained in it are the answers to nearly all the questions anyone might ask relative to the subject

Dr Bauer is to be heartily congratulated on a most necessary contribution to the eventual solution of a knotty problem in the evolution of medical service for the people of the United States

As he rightly says "The social order of the country has changed One group is still fighting the change and would hold to the status quo ante in medicine. Whether or not we like the new social order, it is here and must be faced. Ultra conservatism will get us exactly nowhere. Neither extreme will solve the problem of a better distribution of medical care."

### True Ability Versus Labels

Are the sands of America's independent judgment running out? Is this true in the medical profession?

The outstanding characteristic of the profession used to be the acceptance of personal responsibility. The old family doctor made his own judgments and his own mistakes and stood by them on his own two feet. He stood or fell by the opinion of his peers—by the reputation that he enjoyed in his own community. He was an individualist

Contrast his attitude with that of a brilliant young man in his sixth year of residencies at various hospitals. When asked when he was going to emerge from his monastery and face the world, he said "Yes, I suppose it's time I did. But then it's such a pleasant life. You have great responsibilities, but if you really get into a jam, you just call one of the Attendings in consultation"

Even that attitude is not the worst of it Nobody seems to feel capable of standing on his own reputation. Those in positions of authority do not trust their own judgment Everyone has to be labelled. The doctor now has to have not only his degree from his medical school and his license from the state to practice, he has to have diplomas from far-distant, impersonal boards, beginning with the American College of Surgeons and going on from there to the necessity of being a diplomate of some specialty board

Suppose now he merely desires to care for sick people, to practice medicine. He doesn't care to be a specialist, just to remain a general practitioner. Well, from now on even to do that he must be a diplomate of the Board of General Practitioners or the like

Labels! And more labels! A correspondent tells us of a brilliant girl who had taken the Stevens' Institute aptitude tests. She had been passed in art, creative ability, exceptional aptitude in two foreign languages. She was rejected as a job applicant by two of our most fashionable magazines. Why? Because she had no college degree.

No one dares accept anyone on his own opinion of the other's merits. Everyone previously must have been passed on by someone or something else. Costume designers and editors of fashion magazines are rarely conformist types likely to be the holders of college degrees. But personnel managers can refuse to hire potential geniuses because they are not labelled with the tag of collegiate approval. If one of

their choices turns out to be a failure the blame is not theirs "She had a degree from Wahoo College, didn't she?"

A candidate for medical school is accepted because he has a brilliant premedical scholastic record. Is there anything in that which determines his qualifications to be a good doctor? Those who got their knowledge out of books may be notably deficient in their knowledge of and ability to get on with other human beings.

A surgeon of our acquaintance this morning got a communication from the American College of Surgeons asking him to recommend candidates for the Credentials Committee of this State "Inasmuch as the personnel is

secret to all except the Committee and the College Office ," read the letter, in part

We know of no organization except the Ku Klux Klan and others of that ilk which keeps the names of its Admissions Committee secret. Why should it? Can we not even know the names of those who pass upon qualifications of our future surgeons? Under such circumstances how are we to know whether the will of the majority is respected? Ever hear of the Iron Curtain?

Are we finally to abandon the judgment of our peers, the people with whom we were brought up, who know us for what we are, who live with us, and upon the persons of whose families we practice?

#### The Choice is Yours

Does the ordinary practitioner of medicine understand or practice psychosomatic medicine?

In the old days, the well fed philosophers of the Athenian democracy used to loll about the Agora asking which camefirst, the chicken or the egg, or, did Adam have an umbilicus? The conundrums today survive in terms of psychosomatic medicine paraphrased as "have you a gastine uleer because you really have one, and, because you have one, does its containal gnawing pain make you snappish with your wife? Or don't you like your wife very much, and does your containal suppressed desire to snap at her give you a gastine uleer?"

Peter J Steinchron, M.D., 1 m his book What You Can Do for High Blood Pressure, says 1 "The doctor interested in preventive medicine tells the patient whose pressure is 160 to live like the patient whose pressure is 200. There is no difference. In both cases the treatment is the same. We outline a new way of life. This consists of relief of inner tension, relief from strain of business and social life, sufficient rest and relaxation, numerous vacations, the cutting down of aggressiveness and ambition, and any of the other methods we use to influence the patient to live along at thirty miles an hour instead of the usual sixty."

Doubleday and Company New York, 1947
 New York Times Book Review Section September 7

We are 100 per cent in agreement with Dr Steinchron in principle. His advice is admirable—It outlines perfectly the way of life that probably every harnssed doctor has been searching for over since he started practice.

His remarks point up beautifully one of the most senious fallaces of the present relations between the public and the medical profession.

How is the patient to achieve the balanced life that the doctor so sensibly advises? The doctor's advice is perfect The only trouble with it is that the patient can't take it. Incidentally, is the doctor who prescribes such sweeping changes in the patient's character acting a little too much like God? How does he know what is best for a man? Perhaps his drive and his ambition do give him ulcers. Perhaps his inferiority complex does goad him on to efforts which bring on high blood pressure We concede that. But are there not sufferers who would prefer to die from headaches and high blood pressure, who would honestly rather die mil honaires in their early fifties than live placidly to ninety in the vegetable existence prescribed by their medical consultant?

We think that the public and the medical profession are walking a perilous tightrope between two extremes. On the one hand, we have the patients, such as those who take refuge in psychoanalysis, who wish to throw

themselves body and soul upon the bosom of the doctor

On the other hand, we have the doctor possessed of such superb self-confidence that he has no hesitation in presuming to dictate to the patient the ultimate and most intimate details of his private life, in order, forsooth, that the patient may live a few years longer A few years longer? What for? May it not be true for some that "One crowded hour of glorious life is worth an age without a name?"

The dilemma we have outlined betokens a serious weakness of the present generation. We shun any political implications that might be read into an editorial in a medical journal, but is it not true that the world to-day is broadly divided into two classes?

Those who want to be told what to do and those who want to tell others what to do?

When we go to a doctor we would like him to give us the most searching physical and mental examination possible. He would neglect no nook or cranny of our psyche or our soma. When he finished he would lay his findings on the table as dispassionately as one would set out a set of chessmen.

He then would say, "This is what I think Take the findings home with you. Think them over. Come to your own conclusion Live a long life according to my prescription, or a short one according to your preference. The responsibility for your choice is not mine. It is your life.

"Lave it, understanding that the choice is yours"

#### Universal Medical Service

Under the above title the Canadian Medical Association Journal1 discusses editorially a pamphlet by Dr Douglas Robb, MD, Ch M, FRCS (Eng), FRACS, entitled "Health Reform in New Zealand" "Of all the democratic countries," says the CM.AJ, "New Zealand has gone furthest in trying to work out a scheme of social security which includes the provision of medical service for the entire population" The plan for public organization of medical services\* under the Social Security Bill was undertaken by the first Labour Government in November, 1935 The Bill was passed in So New Zealand has had five years' experience of such a scheme

The Act contemplates first, replacement of existing noncontributory civil pensions by a system of monetary benefits on a contributing basis, and second, a system of general practitioner service available to all, with maternity, pharmaceutic, and hospital benefits, x-ray, laboratory, physiotherapy, neurosurgery, district nursing, and domestic service to be added later

"Apparently," says the CM A.J, "the Government worked out its scheme without consultation with organized medicine in the form of the New Zealand Branch of the British Medical Association The Gov-

1 47 65 (July) 1947

• Italies ours, Ed Apparently a new phrase to avoid the socialized medicine label

ernment measure was political in conception and its contents were not made known to the B M.A until its introduction into the House "

To all intents and purposes, comments the CMAJ, the government is faced with an unlimited liability Dr Robb says, "The fund has to be a bottomless pit" New Zealand seems to be committed to this policy of universal free (so-called) medical service

Turn now to House Report No 786, 80th Congress, 1st Session, July 2, 1947, page 6, of the Committee on Expenditures in the Executive Departments Says the report, "Certain documentary evidence has come to the attention of your committee, that the Bureau of Research and Statistics in the Social Security Board also maintains close contact with movements for compulsory health insurance in other countries

"Under date of May 14, 1947, Mr Isadore Falk, Director of the Bureau of Research and Statistics, sent a memorandum to the Acting Commissioner for Social Security, urging that one Jacob Fisher, a member of Mr Falk's staff, be sent to New Zealand, at Government expense, to study compulsory health-insurance programs and activities in that nation "

Well, what is wrong about that? Shouldn't the Bureau of Research and Statistics

study New Zealand's Labor Government system of socialized medicine or, if you will, its public organization of medical services Mr Falk, who proposed to send Mr Fisher to New Zealand, has been much interested in the Wagner-Murray-Dingell bills of recent years, if our information is correct

His choice of a vessel "to study compulsory health insurance programs and activities" in New Zealand at U.S. Government expense in the person of one Jacob Fisher shows what is wrong. Mr. Fisher, it appears has been documented by the House Committee on Un-American Activities for "almost uninterrupted association, since 1939, with

<sup>3</sup> House Report No. 786 p 7

various Communist-front and fellow-traveler organizations in the United States. At various times, according to his record, Jacob Fisher has been identified with seven different groups or organizations avowedly sponsoring the Moscow party line in the United States "2"

With a record of the sort detailed above, what is Mr Jacob Fisher doing on the staff of Mr Isadore Falk, Director of the Bureau of Research and Statistics in the Social Security Board of the United States Government? Interesting, isn't it? When you think about it As you surely must one of these days or take the consequences and like it.

#### Doctors and Money

We see by the papers, the Saturday Evening Post¹ in this instance, that there is a town with no unpaid bills "Hyannis," says the article, "is a credit town, with no unpaid bills except those of the doctor, who loses 20 per cent Tho general store has had no loss in twenty years "

Hyannis, incidentally, is in the sovereign state of Nebraska, one of those Western states which we in our innocence had always pictured as peopled by great-hearted, rugged, honest characters whose greatest pride was to be beholden to no man. You know, the Village Blacksmith type Well—just another illusion shattered "no unpaid bills except those of the doctor, who loses 20 per cent." The article says just that. No why or how Apparently just a local custom. The inference keep a general store—in Hyannis.

But the article does bring doctors and money together in print. This seems encouraging. Doctors seldom face squarely the problem of money in their professional life. They might well face it now. Seems as though they'd have to, if they want to go on living. Take the case of M. Moreau de St. Méry for example ? He was a noh Creole aristocrat, was educated in France as a lawabiding Liberal in the days before the Terror,

and escaped the country twelve hours ahead of the guillotine. He was the Kerensky of a hundred and fifty-five years ago. He came to this country, and he kept a diary, which we recommend to any of our readers who would find interesting the life of a man catapulted from "king of Paris for three days" to that of a shipping clerk in a Philadelphia warehouse

M Moreau de St Méry kept a diary as noted above and the items that appear in it most constantly are the prices of things. As an aristocrat in Trance he doubtless had never had to trouble himself about such vulgar trifles. As a proletarian, he very shortly found them matters of overwhelming importance.

Well, we know of few doctors who start life as nch anstocrats, or finish it as shipping clerks, but the prices of things have to be considered, nevertheless by doctors as well as anyone else

We have heard complaints recently that the fees for Workmen's Compensation cases were, in spite of their rocent revision upward, still ridiculously low. In the course of an argument on the subject we heard a doctor, supposedly well acquainted with the attitude of state legislators, and, consequently, we suppose, of the public, say "For Heaven's sake, don't put yourselves on record as wanting to make any more money for the doctors. The people now think of them as making more money than they ever did before, of

<sup>&</sup>lt;sup>1</sup> Saturday Evening Post 219: 112 (June 14) 1047 <sup>2</sup> de St. Méry Morsau: American Journey 1793-1798. New York, Doubleday Doran and Co., Inc., 1947 pp. 187-

taking vacations, of going on fishing trips, of never being at home when they are wanted "

To some, this attitude of the people may seem to be a recent one, but Max Neuberger in his *History of Medicine* quotes Galen

"Between robbers and physicians is this difference only, that the former's misdeeds are done in the mountains, the latter's in Rome"

We think that the relations between the public and the medical profession would be enormously bettered if both parties to a private—as well as to a public—medical contract would talk over their arrangement before they entered into it A young man, for instance, with a congenitally weak back should surely be required to pay as much for a permanently strong one as he would have to pay for a second-hand automobile In a great majority of cases he acquires the automobile as a matter of course, but in many instances he does not want to pay for the permanently strong back We don't expect that in the case of emergency operations the cost of preserving a patient's life can be discussed But ordinarily is there a surgeon in this State who has not had the experience of being told that no expense should be spared? No expense is spared—in the matter of special nurses, private rooms, flowers, bedspreads, or what have you Until the doctor's bill comes in

If the relations between the public and its friends the doctors are to improve—as they must—we advise both parties to the medical contract they enter into to be a little more frank with each other

If they do so, we are hopeful that the doctors will not be reproached because, like every other class of men, they take vacations, they go on fishing trips, and never seem to be at home when they are wanted We still like to believe that a man's home is his castle

The doctor is the only man who can be hailed out of his at the whim of anyone who chooses to call him forth. And we are sure that he is the only member of a profession who almost invariably allows himself to be so hailed forth and for doing so is the only member of any occupation in Hyannis, Nebraska, "an honest credit town," assured of collecting 20 per cent less than what he has honestly estimated as the amount due him

Irrespective of what the future may hold in the shape of socialized medicine, of such spineless schemes to take responsibility from the shoulders of individuals, we think the public and the medical profession would both be a great deal better off if they became more practical about that horrid subject—Money They both have to live

#### Current Editorial Comment

Oxygen Poisoning Life-sustaining oxygen, when inhaled at high pressures, may cause convulsions and fatal poisoning Probably all gases are poisonous if breathed at sufficiently high pressures 1 solids and liquids are not poisonous, for the good reason that the blood does not dissolve them in toxic quantities The amount of gas taken up is in proportion to its partial Behnke and his colleagues made pressure the remarkable discovery that not only nitrogen but argon is a mild narcotic at high pressures Per weight absorbed, nitrogen and argon are just about as narcotic as Nitrous oxide and ether are nitrous oxide more efficient as anesthetics because they are more soluble, both in water and in lipoids, and for no other reason Hydrogen and belium are not appreciably narcotic at

\*Donald Kenneth W Brit Med J (May 24) 1947 pp 712-717

That oxygen is a convulsant when breathed at high pressures has been known since Paul Bert's work in 1878, but up to 1941 only about a dozen separate exposures, in which acute toxic symptoms had occurred, had been described Thework carried out by the Admiralty Experimental Diving Unit during 1942 to 1944 is described by Dr Kenneth W Donald in his article "Oxygen Poisoning in Man" This supplies quantitative data on an extensive scale concerning the effects of high-pressure oxygen, both in compressed air and under water, on large numbers of men, and with repeated experiments on the same individual The most important conclusions

ten atmospheres pressure They may well be so at fifty or a hundred atmospheres

<sup>1</sup> Editorial Brit Med J (May 24) 1947 pp 727-728

reached were (1) the extreme variability of tolerance, both between individuals and in the same man from day to day, and (2) the far lower tolerance under water than in compressed air Convulsions have occurred

at a depth of only 40 feet While breathing pure oxygen in compressed air, men present the following signs and symptoms of poisoning pallor, fasciculation of the lips and face, facial perspiration from fine beads to literal pouring, salivation, and the appearance of being under stress These are all early signs. The next group of symptoms are transient minor crises nausca, vertigo, malaise, apprehension, choking sensations, intermittent lip-twitching, rapid breathing and palpitation After a few seconds or minutes, the subject may continue symptomless for a considerable time before an acute end-point Finally the subject presents a group of symptoms signifying more intense intoxication and approach of the danger of convulsion They include depression or euphoria, irrational apprehension even to the point of acute terror, "faraway" feeling, complete indifference, somnolence, clumsiness, fidgeting, bad judgment, depression or constriction in the epigastrium or precordium, and, later, visual or auditory hallucinations signaling the approach of the end point Definite twitching of the lips usually means the endpoint is near This is the most common termination Some cases show respiratory abnormalities such as rapid panting, labored inspiration, grunting, and increasing distress to an acute state of apnea

The clinical impression was of many different patterns of two distinct processes (1) insidious intoxication of the central nervous sytem, and (2) convulsant tendency beginning usually in the muscles of the face On a few occasions, the type of the attack was syncopal The convulsive attacks of oxygen poisoning have an average duration of two minutes, the man being unconscious If returned to air at once, he had but one convulsion case, madvertent continuation of oxygen resulted in a second convulsion in thirty seconds Detailed description of these attacks is unnecessary since in all respects they resemble the major convulsive seizure of idiopathic epilepsy At no time was any attack akin to petit mal observed either clinically or electrically In oxygen poison ing petit mal is unknown

In a series of 388 dives to end point under

water, the following symptoms were recorded twitching of lips 60 6 per cent, convulsions 9 2 per cent, vertigo 8 8 per cent, nausca 8 3 per cent, respiratory disturbances 3 8 per cent, twitching of parts other than the lips 3 2 per cent, abnormal sensations of drowsiness numbness, and confusion 3 2 per cent, visual disturbances 1 per cent, acoustic hallucinations 0 6 per cent, and parasthesias 04 per cent In a senes of wet dives to toxic depths with hard work, symptoms were as follows in 120 endpoint examinations lip-twitching 50 per cent, vertigo 20 8 per cent, nausea 17 5 per cent, convulsions 6 8 per cent, choking sensations 25 per cent, dyspnea 25 per cent, and body tremors 17 per cent appears that nausca and vertigo increase in frequency if the subject is exercising Under-water divers are more free of symptoms than those in the "dry" right up to the moment of hp-twitching or convulsing This makes oxygen-breathing under water at toxic depths highly dangerous

In over a thousand experiments where subjects were breathing oxygen at toxic pressure, in not a single case has there been any positive findings suggestive of lung damage In some cases the pulse is slowed, at 90 feet, the blood pressure (systolic and diastolic) stabilizes after about twenty minutes at 15 mm above normal levels Just before the onset of acute symptoms, the blood pressure goes up another 15 to 20 There was no instance of enlargement of the heart In experiments continued over a period of three years, no adverse after-effects have been noted in any subject's neurologic integrity, intellectual ability, or personality Those who con vulsed showed electroencephalographic findings during and after the fit which were indistinguishable from that seen in grand

mal epilepsy

The most important aspect of oxygen poisoning is the intoxication of the central nervous system including the whole cerebrospinal axis and even to the most peripheral components Dickens believes the primary effect of oxygen poisoning is due to the minute impairment of brain tissue respiration, resulting from the inhibition of The secondary effects piruvic oxidase would be general poisoning of carbohydrate oxidation, since all known paths of carbohydrate oxidation converge at the stage of pyruvate In spite of the careful work of Dickens, the cause of oxygen convulsions is obscure The first requisite for its elucida

tion will be the measurement of the partial pressure of oxygen in the venous blood leaving the brain just before a convulsion If found to be several atmospheres, then the inactivation of enzymes, which Dickens reports, may be a causative factor As a field for further research, oxygen poisoning remains wide open The relatively slow and deliberate evolution of auras, akin to those of epilepsy, is unique to oxygen poisoning and should be further exploited by experimental workers Further study of the various patterns of cortical dysrhythmias before convulsions may contribute to the knowledge of the mechanisms of epilepsy

It has been demonstrated that the dangers of oxygen poisoning are far greater than previously was realized. The variations of tolerance between individuals, the variations of tolerance of each individual, the impairment of tolerance with work and under water, all make diving on pure oxygen below 25 feet of sea-water a hazardous gamble. The only possible conclusion is that such tensions of oxygen should be avoided scrupulously

The Distaff A renewed expression of appreciation is in order on the continued publication of this timely periodical by the Woman's Auxiliary of the State Society, of which Mrs Harry F Pohlman, of Middletown, is the current president The Distaff is to be issued in July, October, January, and April, 1947-1948, under the guidance of Mrs Lee R Sanborn, editor, and Mrs Alfred L Madden, associate The contents of these issues of the Auxiliary's periodical are well worth the attention of our membership, for they reflect admirably the activities of this important organization Moreover, a signal honor which has come to the State organization is the election of one of its most faithful and enthusiastic members to the presidency of the National AuxiliaryMrs Luther H Kice, who has long been identified with various community activities, particularly in Nassau County Her election to this high post is a fitting reward for her years of past Auxiliary service

Our congratulations and good wishes go forth to our doctors' wives for their help in our problems. The continued growth of the Auxiliary is to be anticipated. Certainly the usefulness of a publication of the excellence of *The Distaff* can contribute much to this end

New Editor. We welcome Dr Joseph Garland to the ranks of the editors of state journals He has recently been appointed as editor of the well-known New England Journal of Medicine, to succeed the late Dr Robert N Nye

Roosevelt Distinguished Service Medal In the belief that some of our members may have missed the announcement of the award for 1947 to General Omar Nelson Bradley, we reprint the citation herewith in part

As head of the Veterans' Administration he has confronted difficulties more complex, it has been said, than the invasion of Europe He has increased to an extraordinary degree the efficiency of the organization which deals successfully with upward of fifteen million veterans when, before him, it dealt incompetently with five. He has cut red tape, expelled the "chiselers," raised the standards of medical care and hospital management, and defied the demagogues seeking to exploit the veteran for their own ends. The future of the ex-GI, he has said, "lies in honest opportunity rather than special privilege. We dare not benefit one group of the American people at the expense of another."

A well-deserved tribute to a courageous gentleman May his work go on

### SURGICAL PROCEDURES FOR CARCINOMA OF THE RECTOSIGMOID AND RECTUM

CHARLES GORDON HEYD, B A, MD, FACS, DMSc New York City

In NO field of abdominal surgery has there been such significant progress in the last two decades as in carcinoma of the colon and rectum There has been a constant lowering of operative mortality, a lessening in hospital days an increasing rapidity in convalescence and a noteworthy increase in the percentage of cures

Many factors have contributed to these attain First, the increasing psychologic demon stration of bowel consciousness as exemplified in colon and rectal clinics, (2) the marked advance in technical procedures, (3) an ever-accelerating rate of operability (4) a remarkable accuracy in diagnosis (5) the physical survey and adequacy of preoperative preparation, (6) the selective variety and progress in anesthesia, (7) the inhibition and control of infections by the sulfona mides and penicillin, (8) the extensive use of intravenous therapy for anemia, hypoprotinemia and dehydration, (9) the completeness and maintenance of relatively normal physiology by adequate postoperative therapy, and finally (10) the ability to perform and maintain either a temporary or permanent colostomy in a hygienic status with only minor social disabilities to the patient

It is reasonable to anticipate better results as our present knowledge becomes more widely known and further advances are made in all of the factors enumerated Probably the most discussed aspect in the surgical treatment of cancer of the rectourmoid and rectum is the important question of preservation of the sphincteric mechanism of the normal anus. An affirmative or negative answer to this query must always be made at the time of operation and based upon an appraisal of all the factors revenled after the abdomen is opened. The answer will depend largely upon the operative mortality, the im mediate recovery and the future "cure" Excluding true anal cancer from our discussion, which will eventually mean an abdominopermeal resection of the entire rectosigmoid and rectum we may consider all carcinomata of the rectum and rectosigmoid as being placed in one general group

The most complete diagnostic examination including proctoscopy, x-ray examination and biopsy, will not be able at all times to determine accurately (a) operability, (b) curability and (c) type of resection. In every carcinoma in the area under discussion there are a series of pathologic changes induced in the bowel tube that are initiated by the cancer but are not of themselves cancerous The cancer from the very beginning of its course occasions secondary changes that are of great importance in deciding what technic is to be employed There are certain sequential reactions on the part of the large bowel to a destructive and irritating lesion such as cancer There will be varying degrees of obstruction with stasis, with inflammation and edema of the provimal bowel There will be the local plastic peri toneal changes in the area of the neopleam with either metastatic or inflammatory adenopathy Both or only one may be present but usually both will be As the result of these factors there is a high augmentation in the number virulence and character of the associated bacteria. The rectal segment will be a living test tube of virulent bacteria, of blood, pus mucus, and degenerating cancer cells All of these associated conditions, due primarily to the inflammatory phase of the neoplasm, will be corrected by a temporary Devine colostomy Experimental surgery on dogs has shown conclusively that if a segment of bowel is absolutely and completely defunction alized it is readily debacterialized. A Devine colostomy completely defunctionalizes that portion of the bowel distal to its orifices The follow ing changes rapidly ensue in such a defunction alized segment of the large bowel (1) the hyper

All cancers of this segment of the large bowel are associated with varying degrees of inflammation which is progressive and coexistent with the cancerous progress. In the appraisal and selection of the type of operation the surgeon has a choice of only two procedures an abdominoperineal resection with a permanent colostomy or a resection and anastomosis of the bowel ends with preservation of the anus. I believe the latter procedure should always be preceded by a temporary colostomy of the Devine type.

Presented at the 14I t Annual Meeting of the Medical Society of the State of New York Section on Gastroenterology and Proctology May 8, 1947

trophy, dilatation, edema, and myositis resolve, (2) the segment loses its bacterial potency, (3) complete rest is assured to the intestine tube above and below the neoplasm, (4) the local peritoneal reactive changes subside. In brief, the bowel segment returns to a relatively normal status except in the immediate area of the neoplasm.

Other desiderata of great value are obtained in addition to those indicated above

- (1) The performance of a Devine colostomy in the right upper quadrant is a nonlethal procedure. We have performed 40 successive Devine colostomies without a mortality arising from the colostomy.
- (2) The Devine colostomy is easily accomplished, it allows a complete abdominal exploration and determination of (a) the presence or absence of metastases in the liver, (b) of local pelvic implants, (c) thorough palpation of bowel and tumor, the mobility, its extension, the amount of local inflammatory reaction, (d) palpation of lymph nodes in pelvis and at the bifurcation of the abdominal aorta 12

In short, such an exploration permits a general appraisal of many factors and permits the surgeon to decide the issue between resection with preservation of the sphincter plus a temporary colostomy, or abdominoperineal resection with permanent colostomy It is my opinion that in no other way can a decision to resect and preserve the sphincter be made. The responsibility is a tremendous one, and time will demonstrate by recurrence the wisdom of such a decision certainly better for a patient to have a permanent colostomy and no recurrence than to preserve the sphincter at the cost of recurrence I do not beheve that the same results can be accomplished by resection and eccostomy at the time of opera-I am convinced that only complete diversion of the fecal current by a colostomy, with an interval of ten days to two weeks before resection. is the best way to have all the factors in favor of the surgeon when he makes the decision between resection and anastomosis with preservation of the sphincter, and abdominoperineal resection with loss of the sphincter and a permanent colostomy

There is another factor of great importance in the sequence I have suggested. The patient within two or three days after the preliminary Devine colostomy has complete lower bowel rest, with rectal irrigations the bleeding subsides, the diarrhea disappears, the appetite improves Psychologically, he sees his improvement, his morale returns, and he faces the next phase of his surgery with equanimity. A further gain is that almost immediately after the resection the patient can begin to take fluids and eat. The whole left

bowel is, in theory and fact, completely separated from the patient's gastrointestinal tract decision is made for resection with preservation of the sphincter, the colostomy after six to eight weeks may be terminated easily, without a trip to the operating room and without an anesthesia. by applying the Devine or Debakey-Ochsner crushing clamp After the clamp has been in situ for twenty-four hours and the screw turned to its maximum, the patient may return home for five days to a week when the spur is cut through and the fecal current passes from right to left colon A word of caution must be introduced The spurcrushing clamp must not be applied until x-ray examination demonstrates complete healing of the anastomosis, absence of leakage, and free un impeded normal bowel lumen

The principles suggested above may perhaps be best appreciated by a synoptic account of a recent case

S C, a man 62 years of age, consulted me on September 20, 1946, with the complaint of bleeding and diarrhea His past history revealed that he began to have diarrhea with bleeding in January, 1945, which resulted in the patient's going to the bathroom frequently and expelling small quantities of fecal material with mucus and blood. A barum colon enema examination was performed in April, 1946, and revealed "an obstructive condition at the upper portion of the rectum " The patient was ad mitted to the Post-Graduate Hospital on September 28, 1946 Under cyclopropane anesthesia a proctoscopic examination was made and revealed a large flat ulcer involving the entire circumference of the bowel 10 cm from the anus The histologic examination of the tissue was reported as adenocarcinoma On October 1, 1946, through a right upper rectus incision, a Devine colostomy was performed approximately the level of the cul-de-sac of Douglas there was an annular carcinoma involving the entire circumference with approximately a 75 per cent degree of obstruction, and no metastases could be demonstrated in the posterior rectal tissue or in the

Eleven days after the Devine colostomy, October 12, 1946, under cyclopropane curare anesthesia a lower left rectus incision was made and five inches of the sigmoid, rectosigmoid and two inches of the ampulla of the rectum were excised en masse, and an end-to-end anastomosis was performed. The abdominal meision was closed with through-and-through Malin stainless steel wire sutures. The pathologic examination of the tissue removed was reported as follows "adenocarcinoma of colon, chronic lymphadenitis of paracolic lymph nodes, absence of tumor metastasis in paracolic lymph nodes, polypoid adenomata of colon, arteriosclerosis of branch of mesenteric artery"

The patient made an uninterrupted recovery and was discharged from the hospital on the twenty-second postoperative day. The colostomy was working well and forty days after the resection a banum contrast enems showed "an obstruction in the sig-

moid just below the rectal ampulla, probably due both to operative intervention as well as local inflammatory changes and possible perforation '

On the forty-seventh day a sigmoidoscopic examination showed an inflammatory area three inches in from the anal margin with almost 90 per cent occlusion. In the meantime the patient showed a remarkable gain in weight and on January 11 1947 ninety-one days after his resection a second barium colon enems examination was reported as follows "retrograde contrast calcium showing a foreshortening of the sigmoid with moderate con striction at the anastomotic site was observed.' In brief it required in all about three months for the inflammatory obstruction at the site of the anastomosis to resolve

Now reassured that the left colon was intact and without obstruction, the patient was re-admitted to the hospital on January 18 1947 in the ward of the hospital and without any anesthesia the Devine clamp was applied. Four days later the patient was allowed to return home with the Devine colostomy clamp still in situ. On January 27 the Devine clamp was removed Finger palpation through both col ostomy stomata showed a 'crush through orifice between the ascending and descending loops approxi mately 3 cm in diameter On March 21 1947 or somewhat over five months after the resection the patient had normal bowel movements the left col ostomy stoma was closed and the right colostomy stoma was contracted and closed to a diameter no wider than a pencil. On proctoscopic examination the instrument passed the anastomotic line easily and revealed some remaining granulation tissue at the anastematic junction.

In the chronologic narration of this patient's history a number of observations may be made

- 1 The technical procedures of a resection low down at the pertioned reflection of Douglas are inherently difficult, and the operation requires a relatively long time to complete
- An anastomosis without some leakage is an infrequent occurrence
- 3 Postoperative inflammatory obstruction at the anastomotic line is an almost invariable sequela
- 4 The presence of a preliminary colostomy of the Devine type allows the patient to maintain nourishment and make a quick recovery except for the temporary presence of his colostomy
- 5 The number of cases susceptible to this type of operation will be extremely limited
- 6 The results on a five-year basis must be watched with interest and only then can conclusions be drawn as to the final results

The narration of this patient saurgical odyssey also reveals a number of interesting features The long history of bowel disability would suggest inoperability and only a palliative colostomy. However, upon an abdominal exploration during the performance of the Devine colostomy it was found that the pathologic picture was in the

judgment of the surgeon satisfactory for resection with preservation of the sphincter terval between the colostomy and resection was of great advantage to the patient through the natural channels could be forced The care of the colostomy with a Trusk colostomy cap was simple. The complete defunctionalisa tion and rest of the entire left colon and rectum were immensely important both physiologically and psychologically The eleven days between the stages allowed recession of the inflammatory processes in the area of the tumor. The patient approached the second operation with confidence and a sense of well-being— the worst was over The operation was difficult and time consuming the anesthesia-cyclopropane and curare-was all that a surgeon could desire The convalescence was uneventful the highest temperature was only 102 F, and oral feeding began almost immediately after operation However there were local complications at the site of the resection in the form of inflammatory obstruction and leakage. It has been my experience that complete healing at the site of the anastomosis requires more time than is usually considered necessary Lenkage in a minor degree is an almost constant concomitant probably due to lack of complete peritoneal covering of the bowel ends. Both the obstruction and the leakage cleared up and dwappeared The only professional requisite was patience upon the part of the doctor and cooperation upon the part of the patient

The technic of end to-end anastomosis and the abdominoperineal resection are so well and adequately described that no further comment is required. However I am somewhat surprised that the advantages of the Devine colostomy are not more widely known or employed. The technic is not difficult and the functional result is always good whether employed as a temporary or permanent colostomy.

In conclusion, a preliminary Devine colostomy would seem to be the surgical procedure of choice as the first stage for all operations on the rectosigmoid and rectum for carcinoma. At the time of the Devine colostomy the decision is made a permanent Devine colostomy and abdominoperineal resection and/or a temporary Devine colostomy and resection with preservation of the aphincteric mechanism of the anus by resection and end-to-end anastomous Many investigators have indicated that downward metastasis in cancer of the rectum is extremely rare and apparently occurs only in moperable cases decision to save the sphineteric mechanism always will be a difficult one. A detailed statistical study five or ten years from now will indicate whether we have been overly sentimental in attempting too many low resections with preservation of nor

mal bowel evacuation at the price of recurrence of the cancer

116 East 53rd Street

#### Discussion

John D Stewart, M.D., Buffalo -- We must all admire Dr Heyd's open-minded attitude toward the question of resection of rectal or rectosigmoidal carcinoma with preservation of the sphincter tainly, I myself have a strong prejudice against such a procedure, and for reasons which Dr Heyd has clearly pointed out The chief objective of any operation to cure cancer is a cancer cure, so long as reasonably good health is assured the patient thereby The moment the surgeon becomes distracted from this goal by considerations of convenience, plastic or cosmetic factors, or surgical virtuosity, the percentage of five-year cures begins to dwindle I believe some rectal cancers can be cured by resection and end-to-end anastomosis, but I believe a far higher percentage will be cured by the combined abdominopermeal excision, which includes lymph nodes and blood vessels in the zone of spread of the disease

Furthermore, no matter how skillful the surgeon, as Dr Heyd has pointed out, there will be stenous of the lumen and malfunction of the preserved anal sphineter in many instances of resection and anastomosis

The dissatisfaction with cecostomy as a preliminary measure in decompressing the colon obstructed by carcinoma of the rectum, as expressed by Dr Heyd, unfortunately, is often quite justifiable. I have hesitated, however, to use the Devine colostomy in the presence of obstruction, for it involves an intraperitoneal suture line in an obstructed colon. Instead I do a simple loop colostomy in the right upper quadrant where there is significant obstruction. This has yielded quite satisfactory results in my experience. I have never quite dared to palpate the growth and the region of the growth to determine operability at the time of doing colostomy, for fear of causing dissemination of the infection always present.

#### STREPTOMYCIN USED IN CLOSING DRAINING TUBERCULOUS SINUSES

Streptomyon has now proved effective when used in the treatment of draining tuberculous sinuses According to the former Clinical Director of the Veterans Administration Hospital at Oteen, North Carolina, this is one of the most impressive results in the treatment of tuberculosis in man by the new antibiotic

Writing in the September 20 issue of the Journal of the American Medical Association, Benjamin L. Brock, MD, states that 11 out of 12 patients, with a total of 60 draining sinuses of tuberculous origin, showed outstanding signs of improvement after being given injections of streptomycin over a period of months in the Veterans Administration Hospital at Oteen.

In the 12 cases reported by Dr Brock, 15 per cent of the 60 snuses closed within one to four weeks, and after 12 weeks of streptomycin treatment 80 per cent had closed. (After 20 weeks, all but one sinus had closed) In 11 out of the 12 cases the patients' appetite also improved, and they gained an average of 15 pounds

Certain toxic reactions were observed Dr Brock's patients did not complain of headaches, a common reaction among white patients, but he believes that there is a higher threshold for pain exhibited by negroes, and only one of his patients was white Many were bothered by dizziness, however, and three became feverish after the drug was administered None of the reactions was severe enough to justify discontinuing the streptomycin treatment

"These cases have not been followed sufficiently long to determine whether streptomycin has produced a permanent closure of the sinuses," Dr Brock writes, "but the promptness with which they

healed after the initiation of treatment is one of the outstanding observations in this series"

In another article appearing in the same issue of the Journal, C P Mehas, M D, and Wayne E. Traux, M.D, from the Oakland County Tuber culosis Sanitarium of Pontiac, Michigan, conclude that streptomycin administered early in the course of tuberculous meningitis is capable of arresting the process. They cite a case in which streptomycin was given both by muscular and spinal injections, and in which spinal injections alone suppressed the disease for a long time without producing a resistant strain of the organism.

In this case the toxic reactions seem to have been severe Intraspinal administration of the drug finally had to be stopped because the patient became feverish, stuporous and mentally confused, and even after this she had a convulsion. Her hearing and coordination were also definitely impaired. The tuberculous meningitis itself would have been considered incurable before the advent of streptomycin, however, and the doctors found evidence to show that the changes due to toxic reaction may not be

permanent
In the same publication appears still a third favorable report on the new antibiotic, this one by Eman uel Appelbaum, MD, and Cyrille Halkin, M.D, of New York They cite a case of tuberculous meningitis associated with generalized miliary tuberculosis, another disease which was formerly 100 per cent fatal, in which "complete clinical arrest followed the use of streptomycin" Except for one short episode of dizziness and the appearance of a transitory rash, in this case the drug was well tolerated by the patient, a child

### COMPLICATIONS OF ABDOMINOPERINEAL RESECTION OF RECTUM FOR CANCER

GEORGE E BINKLEY, M B (Tor) and MICHAEL R DEDDISH, M D, New York City (From the Memorial Hospital)

THE surgical treatment of rectal cancer has shown marked improvement during the past two decades. A higher percentage of patients is now being operated upon than at any time in the past. Complications are less numerous and the percentage of fatalities has been reduced greatly

Miles, of London in 1908 described an operation for the cure of cancer of the rectum <sup>1</sup> The foundation of this operation was based on the assumption that complete removal of the primary lesion and the draining lymphatics was necessary to produce the highest percentage of clinical cures. Despite his enthusiasm and the encouraging early results the advantages of the Miles one-stage abdominoperineal resection were not fully appreciated by American surgeons until the late twenties and early thirties. The preliminary reports revealed numerous serious complications with an associated high operative mortality.

The operative mortality of the one-stage Miles abdominopenneal resection has been reduced greatly In our clinic, from 1930 to 1939, the mortality rate was 16 per cent. From 1940 to 1940, it was 2.3 per cent. Beginning in 1939 a sense of 130 consecutive operations was completed without a death

Experience suggests that postoperative complications may be prevented or favorably in fluenced by (1) an adequate preoperative preparation of the patient, (2) treatment while on the operating table, (3) surgical technic, and (4) early recognition with prompt treatment of complications.

Routine preoperative preparation requires a min imum of five days, although in poor risk cases, several weeks may be necessary Cancer of the rectum should be operated upon as soon as convenient, but the average case is not an acute emergency A careful physical examination, which includes the necessary laboratory examination, often will reveal danger signals to be avoided or indicate the treatment to be given. Many patients will show varying degrees of cardiovascular or respiratory disease, enlargement of the proetate, bladder atony, poor kidney function and metabolic disturbances are not infrequent associated findings.

The bowel is prepared for operation by the oral administration of magnesium sulfate and rectal colon irrigations. An adequate cleaning may be

Presented at the 141st Annual Meeting of the Medical Society of the State of New York, Buffalo, Section on Gastroenterology and Proctology May 3, 1947

obtained in this manner within five days. We prefer this technic to sulfonamide therapy

The observations and care of patients while in the operating room should be under the supervision of a physician anesthetist familiar with this type of surgery, if complications are to be kept at a minimum. The anesthetic agent selected and the method of administration is governed by the particular findings in the individual case. Shook is avoided by the administration of blood, blood plasma, isotonic saline, and glucose solutions Patients should be handled carefully between the abdominal and permeal phases of the operation to avoid any sharp drop in the blood pressure

Skilled nursing is imperative during the immediate postoperative period. Deep-breathing is encouraged at frequent intervals as soon as the patient is conscious. Chewing gum and lemon peel are prescribed to stimulate the salivary glands. We believe that this practice prevents the development of acute parotitis, a complication which was not encountered in this group of patients. Movement of the lower extremities with flexion of the knees feet, and toes is advocated as a means of decreasing venous stasis Patients with marked varicosities of the legs frequently are bandaged from the toes to the groins All patients are encouraged to change their position in bed frequently They are allowed out of bed early, if it is thought advisable.

The complications under discussion are those which were observed during the first sixty days after operation in 350 consecutive patients. They were taken from the Colon and Rectal Service of the Memorial Hospital in New York City from the years 1941 to 1946 The operations were per formed by or under the supervision of six differ ent visiting surgeons Complications were widely distributed in the different anatomic systems Some patients had only one complication while others had as many as six or seven. There were eight postoperative deaths an operative mortal ity of 2.3 per cent Although the mortality rate was low, in a small number of cases the postoperative course was stormy One is impressed with the fewer and less severe complications in this period as compared with those which occurred in patients during the previous decade

In the early days of radical rectal surgery shock was of common occurrence but it is now comparatively rare. There were 9 patients with a sufficient degree of shock worthy of mention. The most constant causative factor was excessive blood loss at the time of operation. In the majority of these patients a moderate degree of hypertension and arteriosclerosis was present prior to operation. Two of the patients had mild diabetes.

Bleeding from the perineal wound was not proved to be of a serious nature in this group of patients In most cases there was only a mild oozing beyond that ordinarily expected from wide dissections Control, in such cases, was accomplished by additional packing of the permeal Four patients had sufficient bleeding to warrant the term hemorrhage These were taken to the operating room, the permeal wound opened, the packing removed, and the source of bleeding ligated One patient, an elderly lady, with numerous other complications, had a slight hemorrhage from the permeal wound on the twenty-third postoperative day without serious effects

#### Complications

Cardiovascular system complications were responsible for two deaths Both patients had hypertension before operation Each died of a massive myocardial infarction eighteen and seventy hours, respectively, following operation patients had some degree of cardiac decompensation which was manifest from the third to the thirteenth postoperative days Of this group, 4 had hypertensive cardiovascular disease. 1 had hyperthyroidism of longstanding, and the remaining 4 patients had advanced arteriosclerosis. All recovered promptly after the administration of Tachycardia was observed in three patients, in one of which hyperthyroidism was thought to be the causative factor The others were undiagnosed

Phlebothrombosis and thrombophlebitis are complications dreaded by all surgeons series, 57 per cent of our patients were so afflicted The diagnosis may not always be evident, and the appropriate treatment for the given case is, at times, open to debate Bed exercises to prevent these complications were emphasized routinely, but it is difficult to estimate the benefits of those efforts in a mathematical fashion Surgical trauma is a factor in causing phlebitis Rough handling of tissues, leaning on the patient, especially over the femorodiac region, and inexcusable trauma to the pelvic vessels at operation are possible contributory agents in the failure to re-establish normal venous return postoperatively

There were 6 cases of phlebothrombosis with two fatalities due to pulmonary embolism. The deaths occurred suddenly, without previous symptoms, on the sixteenth and seventeenth

postoperative days Autopsy findings confirmed the diagnosis in both cases Fourteen patients had thrombophlebitis Clinical manifestations appeared from the eighth to the twenty-eighth postoperative days In 2 patients both lower ex tremities were involved The right lower extremity was involved in 5 and the left lower extremity was involved in 6 In 1 man this com plication was limited to the right cephalic vain and apparently was not associated with intravenous therapy In these patients, subjective complaints of vague pain in the lower extremity were often elicited This was described as a local tenderness of a deep sort, particularly in the outer posterior surface of the lower leg

As observed by Homans, the objective signs of thrombosis are in a great degree related to a state in the great muscles of the lower extremities 2 There is an increased firmness on compression and a tendency to resist dorsiflexion of the foot On actual measurement there is an increase of the largest diameter of the calf The clinical chart reveals an elevation of the pulse rate and temperature This clue has been especially em phasized by Bauer and Allen and their associates 3 4 This manifestation most frequently 18 seen on the clinic chart after the patient has leveled off following his operation Circulatory failure to some degree, manifest as faintness or actual loss of consciousness, may result reflexly from dislodgement of a thrombus and pulmonary One patient in our series showed this infarction symptomatology The general circulation may react rather violently to the lodgement of the embolus, and yet may readjust itself within a few hours if no further insult occurs

In the early years in this group of complications, thrombophlebitis and phlebothrombosis were treated by immobilization of the involved extremity Later, the anticoagulants, heparin and dicumarol, were administered, and in one instance the common femoral vein was interrupted At the present time we are emphasizing early diagnosis and the use of anticoagulants

Pulmonary complications are a hazard to any patient who is confined to bed This is especially true in patients to whom an anesthetic has been administered for major abdominal surgery our series, 20 patients (57 per cent) developed pneumonia Bilateral bronchopneumonia was a contributing factor in three of the postoperative Lobar pneumonia, developing on a masdeaths sive atelectasis of the right lung, contributed to the cause of death in another patient Atelectasis occurred in 9 patients Concurrent upper respiratory infections occured in 8 cases In our experience there was no definite relationship between the incidence of wound infections and the incidence of respiratory tract infections as observed by Jones Seven patients (20 per cent)

were observed with pulmonary infarcts 2 were of a massive character and were fatal Three patients had multiple small infarcts, 2 others had evidence of solitary infarction. This disease entity generally is unobserved by the surgeon and it is his tardiness or his failure in detecting it that leads frequently to its much dreaded termination.

Clinically, pulmonary embolism is being recog nized by symptoms and signs often regarded in the past as indications of primary disease of the heart and lungs or perhaps commonplace complaints having no special significance 2. The subjective and objective findings of thrombophlebitis and phlebothrombosis have been discussed under cardiovascular complications Roentgenograms of the lung fields will show evidence of infarction. but if these are small this diagnostic evidence will not be obtained for a few days Electrocardiograms are often helpful in the differential diagnosis of these two closely simulated conditions With such aids to diagnosis in mind, pulmonary embolism can be identified early in a surprisingly large number of cases. When the fact has been established or is strongly suspected medical or surgical treatment may be instituted at once

The gastrointestinal complications have varied greatly in their types and severity Gastric dilatation was noted in 32 cases. In the past, a mortality rate as high as 75 per cent has been quoted for this complication. Early recognition is a factor of greatest importance. This is characterused by an effortless vomiting of greenish brown or black material, a rapid pulse, free perspiration and later definite shock. Acute gastric dilatation may be associated with a mild ileus or be the forerunner of an extensive pentonitis. At times, a considerable nervous element was noted. Ileus, or small bowel obstruction, may be expected in a small percentage of patients undergoing this type of operation Diagnosis and differential diagnosis of these conditions is less difficult today than formerly because of our increased knowledge in interpreting roentgenograms of the intestinal tract and information obtained from the passage of the Miller Abbott or similar intestinal tubes. There were 31 patients with symptoms suggesting ileus or small bowel obstruction Eleven were considered to be ileus, characterized by saymptomatic distention. Sixteen were diagnosed as obstruction of the small bowel The 16 cases of obstruction were first treated by means of the intestinal intubation tube However, 9 of them required operation for complete relief The diag nosis of small bowel obstruction was proved in all cases at operation. The cause was due to a piece of small bowel having become adherent to either the abdominal wall the edge of the mesocolon or the suture line of the pelvic peritoneum. There were 2 other cases who had partial obstruction of the small intestine. One an advanced cardiac,

died of cardiac failure, the other died of general pentonitis.

Necrosis of the distal end of the colon which formed the abdominal colostomy occurred in 9 This complication is encountered in pa tients in whom there has been interference of the blood supply of the sigmoid colon either by ligation of the marginal vessels or too tight a closure of fascia about the colostomy A secondary causative factor may be a marked fall in blood pressure which lasts for several hours after the operation, especially in patients manifesting advanced artenosclerosis or diabetes Treatment of this condition when it is recognized early, consists of "pulling" or "milking" the end of the bowel through the incision until the viable bowel is above the skin margin. Such a procedure usually can be carried out in the patient's room. In only 2 cases was necrosis extensive enough to warrant a transfer of the patient to the operating room. Perforation of the large intestine occurred in 2 patients Perforation of the descending colon followed irrigation of the colostomy with a catheter The other perforation was of the cecum and occurred on the twenty-first postoperative day This latter patient had polycythemia vera and perforation was thought to be an embolic phenomenon

Retraction of the colostomy into the abdomen occurred in 2 cases. One occurred on the fourth day postoperatively following an episode of vomiting due to gastric dilatation. At operation it had been noted that this patient had a short, thick, inelastic mesocolon. Recovery was with out incident. The other occurred on the sixth postoperative day after an attack of vomiting. This patient died of a peritonitis. Strangulation of an inguinal hernia occurred in 2 patients. In each case this complication occurred in the third postoperative week and required resection of the involved portions of the small intestine.

Hematologic and brochemical complications are of frequent occurrence in patients operated upon for cancer, especially those suffering with cancer of the colon and rectum For the past eight years we have given a great deal of atten tion to the maintenance of satisfactory hemoglobin and blood chemistry levels in all patients during the early postoperative period By so doing a much larger percentage of very poor surgical maks have been successfully operated upon Hypoproteinemia is one of the most common com plications. There is considerable evidence to show that a persistent hypoproteinemia may result in tissue edema, ascites altered motility of the gastrointestinal tract wound descriptions, and an increased susceptibility to infection. In an earlier series of cases studied in our clinic, hypoprotesnemia was noted preoperatively in 38 per cent of the patients. After operation, 88 per cent

were in a state of hypoproteinemia during the first postoperative week \*

In this present series, hypoproteinemia of a degree sufficient to warrant aggressive treatment occurred in 68 patients (19 4 per cent) In most instances, the hypoproteinemia is associated with an anemia Marked anemia was observed in 18 6 The degree of these per cent of the patients two states or conditions varied as did the response to treatment Infection is a factor which interferes with the maintenance of normal hemoglobin and serum protein levels Convalescence is most satisfactory in patients with a hemoglobin above 75 per cent and a serum protein not below 55 mg per 100 cc of blood Careful and repeated checks for anemia and hypoproteinemia. together with the estimation of serum bilirubin in all cases where transfusions are indicated, afford a sound working foundation for preventing and relieving these complications Transfusions of whole blood is the treatment of choice in most Blood plasma is given when only hypoproteinemia is present, or in those cases in which a high serum bilirubin level contraindicates the use of whole blood In the second week of convalescence, anemia and hypoproteinemia may be influenced by diet, protein supplements, intramuscular injection of crude liver, vitamin therapy, and satisfactory colon evacuation

Transfusion reactions have presented a real problem in the postoperative care of our patients Fourteen severe transfusion reactions were ob-They were evident as chills, fever, allergic and anaphylactic reactions, and hemolysis Hemolytic transfusion reactions are unfortunately much more frequent than is usually suspected Every effort should be made to eliminate Competent laboratory assistants this hazard are most essential to establish the compatability of donor blood The presence of pyrogens or impurities in solutions or improperly cleansed glassware or tubing may cause febrile reactions critically ill or extremely anemic patients, these febrile reactions may result in a fatal outcome \* Recent experiments by Bing suggested that fatal human reactions occur with markedly reduced alkalı reserves, as ın severe shock 10 There were no fatal transfusion reactions in this series of patients studied We believe that the administration of blood plasma rather than whole blood to patients with high serum bilirubin levels has reduced the number of these complications In one patient an azotemia and hemolytic Staphylococcus aureus septicemia occurred, which was responsible for her death Azotemia was present in one patient who was diagnosed as an advanced cardiorenal risk preoperatively Another case of unexplained septicemia was observed on the second postoperative day An anaerobic streptococcus culture was obtained following a febrile

reaction Repeated blood cultures did not demonstrate the organism

Urinary tract complications are of frequent occurrence They have received considerable attention from both rectal and genitourinary sur-Efforts have been made, and still are being made, to decrease the number and seventy of these complications following radical surgery for Bladder dysfunction is cancer of the rectum most common and occurred in 466 per cent of our patients Of the 350 patients, 71 had mild, 57 had moderate, and 35 had severe bladder dysfunction The mild type is of little more significance than difficulty in voiding after anal and abdominal operations The moderate type is more severe but responds to conservative treatment, such as repeated catheterization or the placement of an indwelling urethral catheter for a The severe type requires either prolonged wearing of an indwelling urethral catheter or surgical intervention Surgery may be necessary either for relief of obstruction or to provide support to the bladder

The cause of bladder dysfunction is open to debate. It is most commonly encountered in patients who have received very wide radical pelvic dissection, whereas those with a conservative operation are seldom severely affected. Nerve section or nerve trauma as a causative factor seems limited to the mild or moderately severe group, and thus it seems to be only one of the numerous factors. Cystitis is often associated with bladder dysfunction. It, in itself, may be a real causative factor. There were 56 cases of proved cystitis in this group and undoubtedly there were many other cases in which the urine was not cultured.

The most constant contributing factor to bladder incontinence is the interference with the normal support of the bladder and urethra The area supporting the neck of the bladder warrants greatest consideration 11 This is the area most interfered with in our wide dissections of advanced pelvic disease, where excision of supporting muscles and fascia is necessary Pelvic fascia of poor quality and poor pelvic supports also suggest a predisposing factor in the female, while enlarged prostate and associated atonic bladder in elderly males must not be overlooked Appraisal of the above factors by the surgeon offers a working basis for the prediction of the degree of bladder dysfunction in a given case This complication is seldom fatal and most patients regain normal control

Hematuria of a mild form was encountered in 4 patients. The cause was attributed to the use of sulfonamides. There was one case of proved pyelitis. The patient was treated by dilatation of the ureter and drainage with excellent results. There was one case of a perforated urethra in a man patient resulting from an attempt at catheterization

Operative wound complications were not numerous or unduly severe. There were twenty mild wound infections. Some of these were not more than superficial skin infections and the majority were localized. Infected hematomas were largely responsible There was one severe wound infection associated with peritonitis The patient died from an overwhelming infection Pentonitis was observed in 4 patients (2.28 per cent) In two instances it was generalized and resulted in the death of both patients. A marked wound infection in one case and retraction of a colostomy in the second were causative factors. The other instance was due to perforation of the sig moid colon following irrigation with a rubber catheter Localized pelvic peritonitis followed a perineal wound disruption There were two disruptions of the abdominal wound One occurred in a catgut suture closure of the abdominal wall. the other in a steel wire closure. The technic of abdominal wall closure with alloy steel wire established by Jones has been used routinely for the past five years.13

One unusual case listed in this series as poor abdominal wound healing due to vitamin C deficiency should be mentioned. Inspection of this patient's abdomen on the fifth postoperative day revealed serosanguineous fluid on the dressing sug gestive of impending wound disruption. The pa tient was taken to the operating room and inspection revealed the wire sutures to be intact with fluid coming from about the coloatomy and between the sutures A dramatic response in wound healing was later demonstrated with the administration of large doses of vitamins A and

There was one partial disruption of the pelvic floor which responded to conservative treatment by placing the patient in deep Trendelenberg posation and placing vaseline packing within the wound In nine instances there was slow healing of the permeal wounds. This usually occurred in very obese patients and in three instances was associated with a severe hypoproteinemia

Among other complications were 7 cases of mental depression (2 per cent) in this series. In 3 cases mental institutional care was necessary Two had suicidal tendencies and it was believed that, in the 2 patients with suicidal tendencies the depression was precipitated by the realization that they had permanent colostomies. The other had previous evidence of involutional melancholia. However, one patient was found to be ad dicted to the use of morphine for a long interval and later died in a mental institution ond patient recovered after a short interval of hospitalization

One young man suffering from essential hypertension developed left facial weakness and paresis of the right extremities for approximately one week postoperatively. Come developed in one diabetic patient on the fifth postoperative day This patient never regained consciousness but did live for several months. Autopsy revealed brain metastases

Abdominal cramps of undetermined nature were observed in 5 patients having considerable mental overlay

Hiccough occurred in six instances Two per sistent cases were associated with partial intesti One had gastric dilatation nal obstruction The other three instances were mild and of short duration This symptom may in some instances be an ominous sign of peritonitis due to devital ized bowel

Cholecystitis was observed in two instances Both responded to conservative therapy one case, cholelithiasis was demonstrated at operation

#### Summary

- Complications and postoperative deaths due to abdominopermeal resection of the rectum for cancer have been significantly reduced in the past five years
- An operative mortality of 2 3 per cent, in a senes of 350 consecutively operated patients, is reported
- Thorough evaluation and preparation of the patient have extended the limits of operabil ity
- The maintenance of essentially normal hematic and biochemical levels has shortened the convalescent period

Genitorumary tract complications, in some degree, occurred in 46 per cent of the patients Ten per cent were severe enough to require opera tive intervention for relief

Coronary occlusion pulmonary embolus peritonitis, phlebothrombous and thrombophlebitis were the most severe complications.

### ABSCESSES OF THE DEEP PERIRECTAL SPACES

Their Significance, Diagnosis, and Treatment

HAROLD COURTNEY, M D, M Sc (Med), Syracuse, New York

(From the Anatomical Laboratories of the Graduate School of Medicine of the University of Pennsylvania)

IT IS not the purpose of this paper to discuss accepted principles of fistula surgery, but to describe one of the more serious types of anorectal infection—the deep perirectal abscess, which is on most occasions overlooked, and, as shown by statistics, on many occasions, improperly treated

For the purpose of clarity, abscesses of the anorectal region may be divided into those below, those within, and those above the levator muscles,

as shown in the accompanying diagram

quently the physician concludes that the patient is exaggerating his complaint. This patient must be given every benefit of doubt and should be referred to a proctologist at once

Delay in surgical treatment permits (1) relatively simple abscesses to become complicated by rupture from one anatomic space into another, (2) necrosis of functionally important anatomic structures, (3) rupture into the rectum (a second ary opening), thereby producing a true anal rectal fistula. As a result, more extensive and in

#### Significance

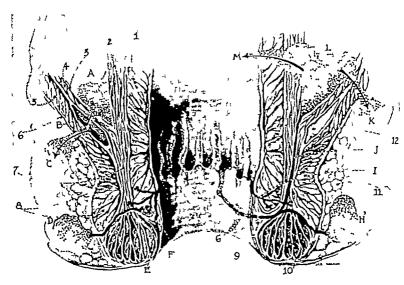

Though the onset of pain from a deep abscess may be gradual or abrupt, it is not long before the patient seeks the advice of his physician

Whereas superficial anorectal infections often show an area of redness, swelling, or induration, the deep variety usually present no external evidence of the suspected infection. Due to this fact, perirectal abscesses go unrecognized for indefinite periods. On many occasions, it is not until the patient reaches the specialist that a correct diagnosis is made and proper surgical treatment instituted. If the specialist is to be of any real service to these patients, the diagnosis must be made by the physician at the time of the first examination.

The family doctor readily will diagnose and institute proper treatment for the usual variety of anorectal conditions. However, unless he has had special proctologic training, or experience with perirectal abscesses on some previous occasion, he is very apt to conclude that there is nothing wrong with this particular patient's anorectum. Therefore, I stress that the patient who complains of anorectal pain, and who, at the time of examination, shows no apparent cause for his discomfort, is often suffering from one of the most serious anorectal conditions. Only too fre-

Presented at the 141st Annual Meeting of the Medical Society of the State of New York, Buffalo, Section on Gastroenterology and Proctology, May 8 1947 creasingly difficult surgical procedures become necessary

In most cases, further extension ceases the moment the abscess is uncapped and tension re-I agree with Fansler, who states, "Contrary to the belief of many, we believe that the earlier these abscesses are drained, the better"1 In our opinion it is a mistake to treat these conditions expectantly and wait for the abscess to "point" The surgeon who waits for any penanorectal abscess to "point" must have a rather insecure feeling as to his own knowledge of anorectal anatomy and is afraid that, by making an incision several inches deep to reach the abscess, he will destroy functionally important structures and end up with an incontinent patient Perirectal abscesses never "point" externally, unless secondary involvement of superficial spaces has occurred They are more likely to "point" or rup-Since these abscesses ture high into the rectum should never be drained through the rectum, utmost caution should be used in making digital and instrumental examinations, so as not to rupture the abscess while making the diagnosis Patients presenting the most extensive fistules either have failed to go to their physician, and the abscess has eventually ruptured, or the physician has treated the patient with suppositories, hot packs, and sitz baths, rather than immediate It is just as much a mistake to prescribe medication for pain, prior to the time the

Coronal section, somewhat schematic, made through the middle of the anorectum, showing the definite anatomic pathways as they occur in anorectal infections and the usual method of 'break through (as shown by the arrows) from one perirectal space to another (Dissection by author)

- Longitudinal muscle layer of rectum.
- 3 Levator lascia.
- Superior layer of levator muscle.
   Interior layer of levator muscle.
- Anal fascia
- Combined longitudinal muscle layer of rectum.
- Deep external sphincter muscle of anus.
- 9. Anal intermuscular septum.
- 10 Subcutaneous external sphincter muscle of anus.
- 11 Fat of ischioanal fossa.
- 12 Lateral extension of posterior levator space.
- A Abscess in pelvirectal space, as a result of 'break through' from the lateral extension of the posterior levator space (Uncommon)
- B Abscess in lateral extension of posterior levator space (Common)
- Abecess in ischioanal fossa, as a result of 'break through' from the lateral extension of the posterior levator space (Rare)
- D Abscess in the ischicanal fossa, with fistula tract connecting the circumanal space and passing outward between the subcutaneous and deep portions of the external anal sphincter muscle (Very common) (Super ficial or perianal variety)
  - Abscess in the circumanal space, formed around a lower branch of an anal duct.
  - Subcutaneous fistula tract, point of origin in an anal crypt and duct (Very common) (Superficial or perlanal variety)
- G. Fixtula tract originating in an anal crypt and duct, thence passing laterally along the circumanal space to "break through into one of the ascending tracts in the combined longitudinal muscle layer of the rectum, to form an abscess in the polvirectal space (Common)
  - $H_{\bullet}$  Abscess in the isohioanal fossa, which originates as in G (Very common) (Superficial or perianal variety) I Schematic representation of an anal duct, penetrating the internal sphincter and the combined longitudi
- nal muscle layer of the rectum. Anatomic pathway within the combined longitudinal muscle layer of the rectum, connecting the pelvi rectal and circumanal spaces (the level of the anal intermuscular septum)
  - K, Abscess in ischioanal fossa, as a result of 'break-through from the pelvirectal space (Very rare)
- $L_i$  Abscess in pelvirectal space, origin in anal crypt and duct, as explained in G (Common)  $M_i$  Abscess of pelvirectal space which has ruptured through the entire bowel wall into the rectum, thereby forming a high secondary opening within the lumen of the rectum (Uncommon)

patient consents to necessary surgery, as it is in the case of the acute abdomen This rather common practice of relieving the patient's pain gives him a feeling of false security and he will often refuse or postpone the inevitable surgery, much to his own detriment

Buie,<sup>2</sup> in reporting the statistics on 1,000 consecutive fistulectomies performed at the Mayo Clinic, stated, "Of all the patients, 46 8 per cent had been operated on once previous to admission to the Chine. 143 per cent twice, 41 per cent three times, 0 9 per cent four times, 0 7 per cent five times, 04 per cent six times, 04 per cent seven times, 0 1 per cent eight times, 0 2 per cent twelve times, and 01 per cent fifteen times" Fansler, in discussing Buie's paper, stated that the above statistics corresponded to his own experience 1 He also stated, "If that percentage of persons with fistulas are not cured by the first operation, there is something wrong with the way fistula surgery is being done" He felt that the cause for failure in these cases was due to the fact that in many instances there was a lack of conviction on the part of the surgeon that most rectal fistulas have a primary opening in one of the crypts of Morgagni 1

While Fansler is correct in the above statements, I believe the principal cause for failure has been due to the surgeon's lack of knowledge of the anatomy of these deep spaces, together with failure, at the time of fistulectomy, to remove the definite, anatomic pathways by which these spaces

become infected

#### Anatomy

The anatomy pertinent to infections of the perirectal spaces will be reviewed briefly

Pelmrectal Spaces — These are two in number, a right and left, lying anterolateral to the rectum, and are filled in with areolar tissue They are situated on either side of the pelvis and lie above the levator muscle (Figs 2 and 3) The superior boundary of these spaces is formed by the peri-The inferior boundary is that portion of the parietal layer of the pelvic fascia which covers the superior surface of the levator muscle (levator fascia) The medial boundary of these spaces is formed by the visceral layer of the pelvic fascia as it surrounds the pelvic viscera In men these comprise the rectum, bladder, and prostate, in women, the rectum, uterus, vagina, and bladder The lateral boundary is the obturator fascia (Fig. Anteriorly, the spaces extend to the point 3, 17) of junction of the parietal and visceral fascias Posteriorly, the pelvirectal spaces are separated from the retrorectal space by the rectal stalks (Fig 3, 18)

Retrorectal Space — The anterior boundary is formed by the visceral fascia on the posterior sur-

face of the rectum, the posterior boundary by the levator fascia and that portion of the pelvic fascia which lies anterior to the sacrum and coccyx, the lateral boundaries by the rectal stalks, on either side. This space likewise lies above the levator muscle and is filled in by arcolar tissue (Fig. 3, 9)

The Posterior Levator Space —This intralevator space is entirely bounded by subdivisions of the levator muscle (Fig 3, 3, 1-12) 3-5 It is a "wedge or V-shaped" space lying against the rectal wall It is situated between the superior and inferior layers of the levator muscle and surrounds the rectum posteriorly and laterally, like a horse-The medial boundary is formed by the combined longitudinal muscular layer of the rectum in man, and the same layers of the rectum and vagina in the woman (Fig 3, 5, Fig 1, 7) The superior boundary of this space is formed posterior to the rectum, by the illorectococcygeus muscle (Fig 2, 8, Fig 3, 8), and to the side, by the superior layer of the levator (Fig. 3, 4, Fig. 2, The inferior boundary of this space is formed, posterior to the rectum, by the coccygeal muscular raphe (Fig. 3, 7), and to the side, by the inferior layer of the puborectalis muscle (Fig. 3, 2)

Pathways of Infection to the Perirectal Spaces—In the past, it was assumed that the lymphatics played the most important role in infection of the perirectal spaces. Present-day knowledge of the anatomic pathways, by which each individual space becomes infected, discredits this view 3-5

As the superior (Fig. 3, 6, Fig. 1, 4) and inferior (Fig 1, 5) layers of the levator come in contact with the rectal wall, each layer gives off thin bundles of muscle fibers to the combined longitudinal muscle layer of the rectum In doing 80, they form a series or row of fossules (Fig. 2, 4) with connecting tracts (Fig. 1, J) which extend inferiorly to the circumanal space (Fig 1, G), or the level of the anal intermuscular septum (Fig 3, Infection spreads from the anal ducts to the circumanal space (Fig. 1, G), and thence upwards along these tracts, to the various penrectal spaces These tracts he within the combined longitudinal muscle layer of the rectum essential that these infected tracts be removed at the time of fistulectomy

The primary opening, in cases involving the posterior levator and retrorectal spaces, is found either in a posterior crypt or in a postanal ulcer. The tracts to the retrorectal space he anterior to the corresponding ones to the posterior levator space (Fig. 3, 19), due to the particular configuration of the combined longitudinal muscle layer of the posterior rectal wall

In involvement of the pelvirectal spaces, the primary crypt opening is usually found in the lateral position. When either the anterior or posterior quadrant is involved, the infection

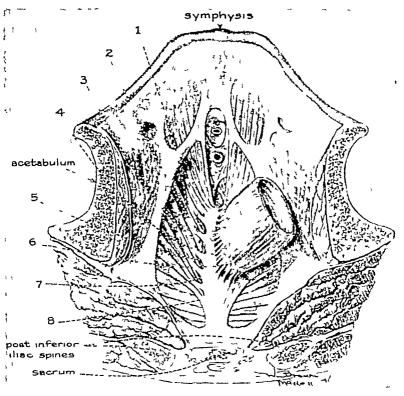

Fig 2. Superior view into dissected male pelvis (looking into the pelvis from above and behind) the rectum being displaced anteriorly and to the right. (Dissection by author)

- 1 Levator muscle-lateral to the point of division into a superior and an inferior layer
- 2, Superior layer of the levator
- 3 Inferior layer of the levator
- 4. The row of fossules, with connecting tracts, which extend inferiorly to the circumanal space (level of anal-intermuscular septum)
- 5 Superior layer of levator forming the superior boundary of the posterior levator space, to the side of the rectum.
- $\theta$  Longitudinal muscle layer of the rectum, giving off fibers posteriorly which units with fibers from the flicoccopyeus and fibers from the levator fascia to form the flicrectoccopyeus muscle.
- 7 The lateral margin of the illorectococygeus musclo—the usual point of "break-through" for absceeces from the posterior levator to the retrorectal space.
- $\delta$  Illorectoeoecygeus muscle (old terminology roctoeoecygeus muscle) forming the superior boundary of the posterior levator space, posterior to the rectum.

spreads along the circumanal space and breaks through along the minute blood vessels, to gain entrance into the tracts which ascend in the lateral wall of the bowel to the pelvirectal space (Fig. 1, G and J)

Occasionally, multiple tracts from a single crypt may extend to form simultaneous abscesses in the various perirectal spaces. Therefore, when more than one perirectal space is involved, the surgeon must search for multiple tract infection.

These abscesses spread according to a definite pattern, which is governed by the mechanical pressure developed within and controlled by the limitations of the individual space involved Thus, infection from the posterior levator commonly breaks through into the retrorectal space at the lateral margin of the iliorectococcygeus muscle (Fig 2, 7) The rectal stalks (Fig. 3, 18) do not form an impervious barrier between the retrorectal and pelvirectal spaces, as previously believed, and extension from the retrorectal to the pelvirectal space is common A spread from the lateral extension of the posterior levator to the overlying pelvirectal space is less common (Fig. 1, A "break-through" from the lateral extension of the posterior levator to the underlying ischioanal fossa rarely occurs (Fig. 1, C) due to the thickness of the inferior layer of the levator muscle In extensive infections. when the surgeon finds an abscess involving the ischioanal fossa and the overlying lateral extension of the posterior levator space or the pelvirectal space, he will also usually find extensive necrosis of the levator muscle of extension is from the overlying space to the underlying ischioanal fossa, and not vice versa, as so frequently stated in the literature (Fig. 1, K)

#### Diagnosis

Regardless of all other findings, the diagnosis of a perirectal abscess is based upon two factors only (1) the history of anorectal pain regardless of type, and (2) the results of the bidigital examination. Regardless of the intensity of the pain, if the patient is reassured and convinced that the examination will be made with the utmost care, the examiner, in almost every instance, will be able to make a fairly satisfactory bidigital examination at the time he first sees the patient

As mentioned before in this paper and elsewhere, 2-5 perirectal abscesses usually show no external evidence of the suspected infection, but digital pressure between the tip of the coccy, and the anus causes extreme, deep pain. In posterior levator and retrorectal space abscesses, the circumscribed bulge of the abscess into the rectum is readily palpated in the posterior midline. Bidigital examination often reveals the abscess to be under marked tension and protruding into the rectum, like a large walnut. Frequently, it is

most difficult to be absolutely certain as to whether one, or both, of these spaces is involved When this problem arises, the question is kettled When the retrorectal at the time of operation space alone is involved, the bulging indurated area occurs above the level of the levator muscle and extends for several inches up into the pelvis between the rectum and the sacrum In abscess of the posterior levator space, the bulge is usually smaller, about the size of a large walnut, and often under more tension than in retrorectal The bulge of the posterior levator space abscess overhes the smooth, rounded edge of the anorectal muscular ring (sling of the puborectalis When the lateral extension of the posterior levator space is involved (Fig. 1, 12, Fig. 3, 3) the bulge of the abscess can be traced along the levator muscle to the corresponding position The medial boundary of the posterior levator space is formed by the combined longitudinal muscle layer of the rectum (Fig 3, 5, Fig 1, 7) Therefore, only a very thin layer of tissue separates the abscess cavity from the lumen of the rectum, namely, combined longitudinal muscle layer of the rectum, circular muscle layer, the submuscosa, and muscosa (Fig. 1, 2, 1) the fact that these abscesses tend to erode the rectal wall, I am of the opinion that upon many occasions in the past abscesses of the posterior levator and retrorectal spaces have been misdiag nosed as mural abscesses

Due to the larger size of the pelvirectal spaces and the elasticity of the peritoneum which forms their superior boundary, abscesses of these spaces are under less tension, are more fluctuant, and present a boggy sensation to the index finger. The bulge of these abscesses hes above the level of the levator muscle

In the more complicated cases, all the peri-anorectal spaces, both superficial and deep, may be involved due to (1) simultaneous formation of abscesses in the different spaces, (2) in long-standing cases to separate involvement of the spaces along their individual pathways of infection, and (3) to rupture from one anatomic space into another

In making a diagnosis, one must always take into consideration the other coexistent painful anorectal lesions found upon examination, such as anal fissure and ulcer, thrombosed, prolapsed, strangulated, or gangrenous hemorrhoids, prolapsing anal papillae and ischioanal abscess, and evaluate their importance. Too often the examining physician concludes that this lesion is the only cause of the patient's discomfort.

#### Treatment

Once the diagnosis of perirectal abscess is made, no time should be lost before operation. These deep abscesses, with their inevitable fistulas, are

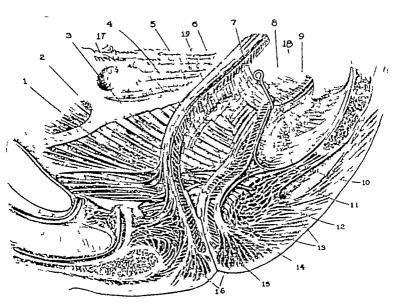

Fig. 3 Midsagntal section somewhat schematic showing the relationships of the anorectum to the pelice displaragm and the anorectal musculature. A window has been cut through the lateral wall of the rectum, layer by layer to show the relationships lateral to the rectum. (Disection by author)

- 1 Combined longitudinal muscle layer (anterior to the rectum) This layer is composed of the longitudinal muscle layer of the rectum, fibers from the levator fascia and fibers from both the superior and inferior layers of the levator.
  - # Inferior layer of the puborectalls muscle.
- 5 Arrow lying in the posterior levator space. This space surrounds the rectum like a horseshoo, with the open end of the horseshoo toward the publis
  - 4 Superior layer of the levator muscle
  - 5 Combined longitudinal muscle layer of the rectum (posterior to the rectum)
  - 8 Fiber from the superior layer of the levator to the combined longitudinal muscle layer of the rectum
- 7 Inferior boundary of the posterior levator space formed behind the rectum by the superior surface of the cocyygeal muscular raphe.
- 8 Hierectococygeus muscle formed by fibers from the lilococy gous (atriped) fibers from the longitudinal muscle layer of the rectum (amouth) and a few fibers from the levator fascia. This muscle forms the superior boundary of the posterior levator space behind the rectum.
  - 9 Retrorectal space.
  - 10 Coccygeal muscular raphe—attaching to the tip and sides of the coccyx.
  - 11 Posterior subsphinetone space (connecting the two ischioanal fossae)
  - 18 Puborectalis muscle (the sling of the puborectalis behind the rectum)
- 13 Fibers of the deep external anal sphincter muscle inserting into the skin along the anococcygeal skin sulcus.
  - 14 Deep external anal sphincter muscle (posterior to the rectum)
  - 15 Anal intermuscular septum.
  - 16 Subcutaneous external anal sphinoter muscle.
  - 17 Obturator fascia.
  - 18 Rectal stalk.
- 19 Anatomic tract lying within the combined longitudinal muscle layer of the rectum, extending from the circumanal space (level of the anal intermuscular septum) below to the fessules in the retrorectal space above

best operated in stages. The first stage should include incision and drainage and the location of the primary crypt and tract through which the infection originated

Transsacral caudal block is the first choice for anesthesia, and low spinal the second verted, or "lack-kmfe" position, offers many advantages over all others for these operations abscess and fistula operations the anorectum should never be dilated because of the possibility of spreading the infection or rupturing the fistu-Such a rupture makes it more diffilous tract cult to follow the entire tract throughout its If the anorectal line is carefully incourse spected, occasionally a drop of pus may be seen exiding from the offending crypt, otherwise, every crypt must be explored with a fine silver were crypt hook to determine, if possible, the location of the primary opening When an anal ulcer is present, there is usually little difficulty in inserting either a crypt hook or ball-pointed grooved director along the primary tract into the abscess cavity However, extreme gentleness must govern this procedure, otherwise, the probe may be forced through the wall of the fistulous tract and a false opening created Only one or two minutes are necessary for the exploration of If the primary opening is not readily the crypts found, the surgeon should proceed with the operation and depend upon locating the primary opening from the abscess cavity after incision and A bidigital examination performed at this time often adds more information as to the extent and location of the abscess

It is better to open these deep abscesses under direct vision, layer by layer, to be absolutely certain of landmarks

Posterior levator and retrorectal space abscesses are best opened and explored through a This separates, rather posterior midline incision than severs, the fibers of the external sphincter. the coccygeal muscular raphe, and the illorectococcygeus muscle (Fig 3, 13, 10, 8) places the anal end of the incision in close proximity to the usual posterior location of the primary opening The abscess cavity is gently explored with the finger for size, pockets and openings extending into adjacent spaces should not be used in breaking up pockets, and if the abscess is walled off, under no circumstances should this protective barrier be ruptured. The incision is extended from the anorectal wall to the tap of the coccyx If the lateral extension of the posterior levator space or the pelvirectal spaces are involved, a curvilinear counterdrainage incision is made lateral to the external sphincter This incision is carried anteriorly to the muscle full extent of the abscess cavity and postenorly to the lateral margin of the posterior insertion of the

external sphincter into the skin (which should not be cut) After passing through the fat of the ischioanal fossa, the inferior layer of the levator muscle, covered by the anal fascia, is identified and incised, thereby opening the lateral extension of the posterior levator space If the pelvirectal space is involved, the superior layer of the levator also must be incised. If a crypt or anal ulcer, which the surgeon suspects of being the primary opening, has been located, he should attempt again to pass the flexible probe or ball-pointed grooved director from this opening into the abscess cavity, placing his index finger into the abscess as a guide If he is unsuccessful, he should reverse the procedure, attempting to locate the primary tract from the abscess cavity Once the primary tract is found, a heavy silk seton should be drawn through it and tied loosely around the intervening sphincter musculature edges should be trimmed far back to prevent inversion Several Penrose drains should be passed into the abscess cavity, and one or two more passed from the primary through the counter drainage incision, and fastened

Penicilin and appropriate sulfa drugs are prescribed, both before and after operation

The Penrose drains are removed in twenty-four to forty-eight hours. The wounds are kept open, and bridging prevented, by gently drawing a sterile gloved finger along the base of each wound at three- to five-day intervals. This is continued until complete healing has occurred. All dressings are removed on the morning following operation, and continuous hot boric compresses applied. Hot sitz baths are instituted as soon as the drains are removed and are continued four times daily. The patient is permitted bathroom privileges eight to twelve hours following operation.

The second stage of the operation, or fistulectomy, is not performed until the wounds from the previous operation have healed up to the seton which was inserted at the first operation

The cardinal principle of fistula surgery demands that the fistulous tracts must be opened from their primary source to their termination, regardless of how much muscle intervenes. Since it is equally important to have a continent patient, there are certain other principles which must be observed. The surgeon cannot cut through the entire anorectal musculature in one stage without permanent loss of sphincter control. However, continence can be maintained throughout the entire convalescence if the intervening musculature is incised in two stages.

In those cases in which a seton has been left in place, a flexible silver wire probe is passed along the side of the seton, one end protruding from the unhealed portion of the wound and the other end brought out through the anal opening, and the ends loosely twisted together. This bends the probe like a hairpin and brings each portion of it in close apposition to the bowel wall. Starting internally, the surgeon cuts through the bowel wall from cephalad-caudad until the innermost edge of the subcutaneous sphincter is reached, using both limbs of the probe as a guide. A seton is tied loosely around the subcutaneous portion of the external sphincter, to be cut out at a later date No packing is placed in the wounds. Healing is controlled from within outward, by keeping the distal portion of the wound open with the gloved finger As soon as the wound has healed up to the seton, the subcutaneous sphineter is incised, the tract lightly curretted, and the primary opening and all other coexistent anorectal pathology (crypts, papillae, and hemorrhoids) excreed.

The roof or superior boundary of the posterior levator space is formed by the iliorectococcygeus muscle (Fig. 2, 8, Fig 3, 8) Therefore, if the surgeon completely lays open the tract to this space, only the illorectococcygeus portion of the levator will be left intact. Even though this portion of the musculature is enough to maintain continence, it is far better to split the musculature in two stages. When the retrorectal space is involved (Fig. 3,  $\theta$ ), it becomes necessary to divide the entire anorectal muscular ring, therefore this procedure must be performed in stages. The primary tracts to the priving tall space (Fig. 1, G, J) should be removed from within the lumen of the bowel at the time of fistulectomy volves incising the mucosa, submucosa, internal sphincter, and a portion of the combined long-It leaves the tudinal muscle layer of the rectum entire subcutaneous, deep sphincter and anorectal muscular ring intact, and is a relatively simple procedure. Severing of the internal sphincter is of little importance, as far as "bowel control" is concerned. When a supralevator abscess has ruptured back into the rectum, thereby forming a high secondary opening (true analrectal fistula (Fig 1, M), making it necessary to sever the entire ancrectal musculature, this procedure must be performed in stages.

On many occasions, during the operation, open ings will be seen in the location of normal anatomic pathways, and the surgeon is unable to tell at the moment, whether or not they are pathologically involved. Frequently by inserting a sharp-pointed hemostat into the opening and spreading it, or increang it one-fourth inch, he is immediately able to tell if granulation tissue is present

In chronic fistules involving the perirectal spaces, there are often one or more secondary openings upon the perianal skin, the result of previous rupture or inclaional drainage of the abacesa. If the entire course of the fistula is not known, it is unwise to start the fistulectomy from the primary or internal opening, which immediately involves severing the anorectal musculature. In these extensive cases, the fistulous tract should be exeased from the secondary skin opening down to the anorectal musculature and a seton inserted, as previously stated

#### Conclusion

Surgery involving the perirectal spaces is defi nitely major surgery There is no stereotyped, surgical procedure which can be followed operation must be fitted to each individual patient, not the patient to the operation The time spent searching for elusive pathways of infection is by no means wasted. The surgeon who prides himself upon the speed with which he can perform these operations will certainly have a much higher percentage of failures than the surgeon who is careful and meticulous in his anatomic dissection

1602 STATE TOWER BUILDING

#### Discussion

Dr A. W Martin Marino Brooklyn New York -I am in complete accord with the essaylst s statement that operations involving the perirectal spaces are definitely major surgery Important pelvic structures are involved and abscesses in these regions if neglected, will endanger life. If the surgeon bears in mind and recognizes the pathways of infection to the spaces under consideration, operations for these deep abscesses need not be technically difficult and satisfactory results can be anticipated.

The speaker emphasized early diagnosis and immediate operation in these cases. The diagnosis should be made in 100 per cent of the cases by simple digital examination and, unlike abscesses elsewhere in the body, perirectal abscesses should be drained properly as soon as possible after the diagnosis is made. Waiting for fluctuation, pointing localiza tion and so on is a waste of valuable time I have seen patients who have been suffering for days with roctal pain, fever inability to eat, dehydration, and prostration while their physicians were waiting for visible signs of local infection to develop The diagnosis can be made promptly with the examining Unless the diagnosis is made early these deep abscesses will extend from one space to another until eventually all the spaces may become involved. Extension of the infection ceases as soon as adequate drainage is established.

# CLINICAL EVALUATION, TREATMENT, AND FOLLOW-UP OF M. ACQUIRED TUBERCULOUS LESIONS

WILLIAM G CHILDRESS, M D, Valhalla, New York

(From the Grasslands Hospital)

CONTINUOUS tuberculosis case finding A program, which consists of pre-employment and subsequent routine chest \-ray films of employees at Grasslands Hospital previously reported, has provided the opportunity for observing newly acquired tuberculous lesions in the various stages of development, progression, or regression Each of the 67 employees reported here out of 6,869 employees covering a period from January 1, 1932, to January 1, 1947, had one or more negative chest \-ray films and was without symptoms prior to the development of disease

A record of the tuberculin reaction in this series, complete since 1942, was available for only 50 per cent of patients prior to that time lesions described developed in persons during a period of employment at Grasslands or affiliated hospitals and all but 11 who developed disease were known to have had exposure, and the others the opportunity for direct or indirect contact

Annual follow-up, in most instances by the hospital staff, was obtained on all but one person who was lost track of in 1936 She was a graduate nurse with a minimal lesion classified as arrested when last examined

Table 1, Section A, shows the number of newly acquired lesions for each of the years beginning 1932 through 1946, and the classification mal lesions, pleural effusions, and mediastinal node involvement constitute 82 per cent of the lesions observed, while 11 had reached a moderately advanced and 1 a far advanced stage when detected, and account for 18 per cent

Original pulmonary lesions developed in the right lung 35 times, in the left lung 19 times, and bilaterally 3 times Four effusions were on the right and four on the left side node enlargement protruded bilaterally in each Mediastinal

Since all lesions developed over a period of a few months they were considered to have elements of an exudative character and, therefore, to be active However, some appeared strikingly productive or fibrotic on the roentgenogram when

Table 2 shows the age groups, sex distribution, and occupation of employees Since there were slightly more than twice the number of women

Presented before the Medical Society of the County of Westchester, White Plains, New York, January 21, 1947

than men employed in the group, the par does not appear to be significant. In' the higher incidence of disease occurred a under 30 years of age

All but 5 patients were admitted the Tuberculosis Division and reof ten and four tenths months of ' ~ ' including an average of six months bed is out bathroom or other privileges in form of ambulation, except for weekly While on bed rest patients at IMBLE 2-In: a takınc ported to and from treatment nous the 1-ray department on stretchers Rx-ray films were taken of patients too lit transported to the x-ray department

Five not treated at Grasslands gave up followed a routine of cure elsewhere, and for the most part, followed by the ...

Twelve patients had advanced , by In addition, In lesions when first detected minimal lesions progressed to an advanced! as shown in Table 1, Section B Five > from the time of detection and while on bel and 5 reactivated and progressed after fix sponding favorably to a period of ha and bed rest

All advanced lesions were accompanied symptoms and abnormal physical signs, and duced a positive sputum In addition to be a 7 patients received pneumothoray, 4 bilities and 3 of the 7 subsequently required inplasty

Thirty-five employees with minimal pri ary tuberculous lesions received bed rest and Three with m portive treatment only lesions required two or more periods of bed but did not advance Two are now reco Eighteen of the 35 had initial treatment symptoms which often were taken lightly by individual, although occasionally they men sufficient severity to cause concern, and ass sult medical advice was sought before no check-up was due Seventeen had no read symptoms

Eight employees who developed pleurs in effusion had the usual symptoms In 3 thether fluid was positive for tubercle bacilli on gur The fluid was reported us pig inoculation Four of the 8 develop for tubercle bacıllı ın 5 The pleural fluid was po tive for tubercle bacilli in 2 cases and negaling pulmonary lesions

th Two lesions developed on the same side as the side and 2 on the control ateral side. In 3 of sepatients the tuberculin reaction was originary negative and in 1 it was positive. Two had a diagrams and one involvement.

### Sexisting Diseases and Complications

Tuberculess developed in 1 employee with hma, in another with diabetes, and in 1 with romegalic features Pulmonary tuberculosis somplicated by tuberculous laryngits in 3 ses, and by tuberculous enterits in 3 cases, 2 the latter having coemistent laryngits and dentis. Pneumothorax treatment was comleated by empyema in 2 cases.

Table 1, Section O, shows the present status of nployees Forty nine are classified as well and mader themselves fully rehabilitated Thir sen are now curing 4 for the first time and 9 for slapes of disease Four of the latter group are serving pneumothorax and 1 of these has had a horacoplasty on the contralateral side. One, an treated case of minimal tuberculesis, was lost rack of in 1938 4 died

The present classification of the leasons is 36 unimal, 13 moderately advanced, and 8 far dvanced. Four patients with pleural effusion ecovered, and 2 with tuberculous adenitis reovered Tuberculous was the cause of three of he four deaths.

#### Deaths\*

A 31 year-old asthmatic patient with a minimal lesion who had transferred to the West to continue her cure died of "heart disease." She possibly had cor pulmonale as the electrocardiogram showed signs of right heart strain while she was at Grasslands Hospital

One death resulted from progressive bilateral bronchogenic tuberculosis in the case of a nurse who was unable to adjust to hospital routine and attempted to take the cure at home.

The two hospital deaths resulted from progressive hematogenous tuberculosis.

Case 1 -8. A. a 21 year-old white woman, a student nurse entered the Westchester School of Nursing on September 1, 1938. The family history was negative. Serial roentgenograms were nega tive from the time of admission until March 1941 Her assignment in the Tuberculosis Division was in February and March of 1941 and she stated that she had contact with tuberculous patients in other parts of the hospital. On March 19 1941 she became hoarse and lost her voice. Her temperature was 101 F and an x ray of March 30 revealed an exudative lesion in the right second anterior inter space. Her tuberculin reaction, which was negative through 1 mg, of old tuberculin on March 13 1941 was positive to 1/100 mg. of old tuberculin on April 10 1941

Case histories of the 2 cases that died in the bospital are given here in detail.

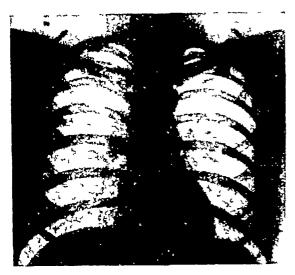

Fig 1 (Case 1) Reveals early exudative lesion, right second anterior interspace

Physical examination and laboratory findings were essentially negative except for evidence of laryngitis and positive gastric culture for tubercle bacilli. She was placed on strict bed rest and supportive treatment. Her course was progressively downhill, with increasing involvement of the laryna, and x-ray evidence of intestinal involvement. Roentgenograms revealed progressive bilateral dissemination suggestive of a hematogenous type, although the early lesion was exudative and cavitated. She expired on July 24, 1944, after forty months of hospitalization. There were no signs of meningitis

Case 2—K J, a 19-year-old white woman, a cadet nurse, entered the Westchester School of Nursing in January, 1944 The family history was negative Serial chest roentgenograms were negative

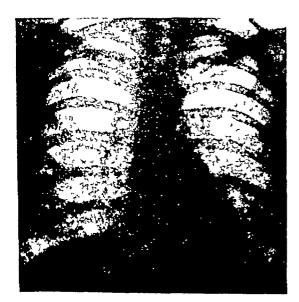

Fig 2 (Case 1) Reveals subsequent pulmonary homatogenous (?) dissemination

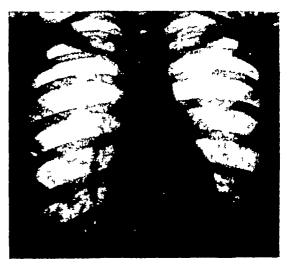

Fig 3 (Case 2) Negative film on June 12, 1945

until August, 1945 She completed a six-week assignment in the Tuberculosis Division in July, 1945 Her tuberculin reaction, which was negative through 1 mg of old tuberculin on March 5, 1945, was positive to 1/100 mg of old tuberculin on August 13, 1945 On August 20 she developed enlarged cervical glands bilaterally, accompanied by fever On September 12 an x-ray of the chest revealed widely disseminated pulmonary hematogenous seeding, and her sputum was positive on culture A mass of cervical nodes bilaterally measured approximately 6 by 8 cm Auscultation revealed scattered fine crepitations throughout her lungs Early in October she developed pain in the right ear and examination revealed a bulging drum which subsequently perforated and proved to be tuberculous. Early in

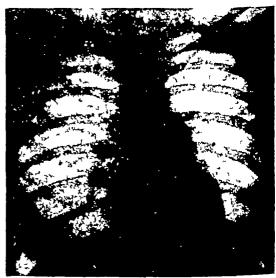

Fig 4 (Case 2) Reveals widespread biliteral involvement, hematogenous type September 14,

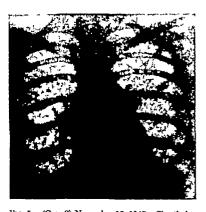

Fig 5 (Case 2) November 15 1945 Shortly before death.

November she developed hearseness, less of voice and examination of her larnyx revealed extensive ulceration of the vocal cords. This extended very rapidly involving the nasopharynx. Her course was rapidly downhill and she expired on November 29 after seventy-eight days of treatment. There were no signs of meningitis.

#### Clinical Evaluation

Amberson considers early pulmonary infiltrates in young adults to be potentially active and progressive until proved otherwise . Our experience amply confirms this observation The explosive nature of apparently innocent pulmonary lesions has been emphasized recently by Muschenheim,3 and this experience also supports his observa-Twelve lessons in this series were advanced when first detected and 10 patients with minimal lesions developed advanced disease and 4 patients with pleural effusion subsequently developed pulmonary disease. All of these were accompanied by symptoms and x ray evidence of activity Five of the 10 minimal lesions that advanced were positive on culture or guinea pig inoculation of sputum or gastric washings before advancing. Cultural technics now employed reveal a high percentage of positive cultures of gastric washings in early minimal lesions. Ord way, Medlar, and Sasano have shown that repeated cultures often reveal acid-fast organisms of gastric washings even after clinical stabilisation of the disease has occurred

Other laboratory data in this series were not particularly helpful from the standpoint of prognosis, although the sedimentation rate, lymphocytic, and monocytic counts were higher in advancing lesions These were routine examinations and were not planned or done as a special prognostic guide

Lesions that developed in negative tuberculin reactors had a tendency to show less stability than those in positive reactors. Seven of the 9 relapses occurred in this group and received an average of thirteen and nine tenths months' hospitalization at Grasslands, and 4 of them are still curing

#### Treatment

All newly acquired lesions were considered active and, therefore, to be in need of prompt hospitalization and treatment. Those that were hospitalized received bed rest in addition to special collapse procedures as indicated The indica tions for bed rest in the treatment of tuberculosis are so widely accepted that they do not need further discussion here. It may be said that no ill effects from bed rest were encountered in this The value of collapse therapy is demonstrated here again where pneumothorax and thora coplasty were required to arrest the progress of the disease. The principles of collapse procedures are generally accepted and need no elaboration at this time Practically all services of the hospital were called upon to assist in the management of this group of patients with tuberculous, its complications, or other coexisting disease. There is no purpose in discussing the various technics of treatment since they are familiar to all of you.

Streptomycin was not available for this group, but if rapidly progressive hematogenous or millary forms of the disease and meningitis should be encountered in the future, its use would seem justified in view of the experience reported by Feldman and Hinshaw <sup>5</sup>

Follow-up—As shown in Table 1, Section C, 49 of the 67 patients are well and working or able to work. Contact was lost with 1 minimal arrested case. Thirteen are still curing and 4 have died Of the 13 that are curing the prognosis is favorable in all except 1 case of bronchial disease this patient is ambulant

#### Preventive Technics

More important than treatment is prevention. Tuberculoses in recent years has often been regarded as an occupational hazard for hospital workers especially for those in close contact with the disease. This has served to create undue fear among certain groups of the public and the profession. This is not surprising since nearly every compensation claim is supported by medical authority for and against the validity of the claimant. The cost of compensation is one reason why nursing schools are not permitting their

students to affiliate in tuberculosis It is not reasonable to expect that physicians and nurses will go through life without tuberculosis contact, and, moreover, one does not enter the fields of medicine and nursing to evade responsibility There is no more justification for refusing to care for tuberculous patients on these grounds than there is for refusing to care for other infectious or contagious diseases Instead of emphasizing the danger to tuberculosis exposure it is well to point out that approximately 985 per cent of those intimately exposed do not develop the disease Attention to inherent or acquired mechanism of protection is worthy of more attention

Applying the Modified Life Table formula used by Frost,6 the annual attack rate for nurses in this series, as reflected in Tables 3 and 4, was student nurses 1 39, and graduate nurses 0 99 per 100, respectively Riggins and Amberson<sup>7</sup> reported a morbidity rate of 1 93 per 100 for student nurses at Bellevue Hospital, and Beckerman,8 in a similar study, reports 122 latter figures, as well as our own, are considerably higher than those reported by Muschenheim, Bunn, and Lansdown which were medical students 0 2, student nurses 5.2, and graduate nurses 60 new cases per 1,000 per year for students at New York Hospital 3 It is also higher than reported for comparable age groups reported by Reid for clerical employees in the Metropolitan Life Insurance Company, which was 2 to 3 per 1,000 per year D M Lim-Yuen, using the same formula, reports an annual attack rate of 18 per 100 for sanatorium employees at Manitoba Sanatorium 10 Myers, Diehl, Boynton and Trach<sup>11</sup> report an overwhelming preponderance of lesions in medical and nursing students in a student body of approximately 12,000

Search for unsuspected tuberculosis in the general wards and intensification of protective technics have become a part of the routine at Following a demonstration begun Grasslands in July, 1941, chest roentgenograms have been taken on admissions to the general hospital wards 12 When tuberculosis is discovered patients are promptly placed on barrier and transferred to the Tuberculosis Division In the Tuberculosis Division protective measures consist of wearing masks and gowns and frequent washing of hands by those in close contact with patients This has been a rigid requirement of student nurses and interns with a negative tuberculin Sicker patients are isolated in indireaction vidual rooms Collection of sputum and other specimens is carefully carried out, and employees in close contact with tuberculous patients receive chest roentgenograms at six-month intervals or Hygienic living habits, rest, and proper less nutrition are encouraged An educational program in protective technics for hospital workers and patients is a necessary part of any wellplanned hospital program

In regard to infection, it is interesting that 18 student nurses converted from tuberculin negative to tuberculin positive before they were assigned to duty in the Tuberculosis Division Since there was thought to be little danger from exposure to the general hospital patients who were screened on admission, it was necessary to look elsewhere for possible contact. In doing so it was found that all of them had been in contact with a considerable number of tuberculosis patients treated in other stations in the general hospital

In Table 1, Section A, it will be seen that the higher morbidity occurred in 1945, after case

finding measures had been sharply intensified. We believe, however, that this may be due at least in part to adverse living conditions and poor food as a result of the war

I concur in the opinion expressed by Muschenherm that to impose a strict isolation technic of the kind employed for highly contagious diseases is impracticable if not misleading. As shown by this experience with tuberculin conversion, until other stations in the hospital have been freed of tuberculosis, instituting an isolation technic in the tuberculous division will not necessarily prevent exposure At the University of Michigan Hospitals, Barnwell found that of 26 student nurses, 4 who developed the disease originally had a negative tuberculin reaction and were exposed to 5 cases of open tuberculosis in the gen eral wards 13 Only 2 of these were exposed in the tuberculosis wards for a period of one month where they were required to follow a protective technic

Discussion of preventive measures would be incomplete without reference to renewed interest in BCG vaccine generally, and especially for selected groups of individuals. Holm states there is no doubt that vaccination protects against primary tuberculous infection but is less sure that it protects against pulmonary tuber culous or phthisis." Much experience has accumulated over the years, and Ferguson's experience in Canada is of special interest in relation to nurses.11 The reports of broader applica tion, especially in Denmark, by Holm,14 and in Indian Reservations by Aronson,16 and the work of Resenthal are all encouraging Therefore. the question rightly may be raised concerning its use in young tuberculin negative groups such as student nurses who are to be exposed

#### Summary and Conclusions

Sixty-seven employees out of 6 869, or 0 9 per cent. were treated for newly acquired tuberculous lesions during the years 1932 to 1947 The type extent, and classification of the lesions are discussed for the various age groups. The need for early diagnosis, isolation, and treatment is demon Treatment included bed rest and the selected use of collapse therapy Streptomycin was not available for this group, but is recommended for progressive hematogenous disease of the type described in the two deaths that occurred at the hospital The need for intensified protective technics is obvious, and BCG vaccination would seem to be indicated for young people with a negative tubercular reaction who are to be exposed

#### DENTISTRY CAN PLAY IMPORTANT ROLE IN PREVENTING DEAFNESS

Many of the 10 million Americans who suffer with impaired hearing should be sent to a dentist, according to an article in the current issue of the Archives of Otolaryngology published by the American Medical Association. And, says the writer many fewer Americans would be so afflicted if more attention were paid to the role that intelligent dentistry can play in the prevention and control of deafness.

The writer David J Goodfriend, D.D.S of Phila delphis, is reporting on studies carried out in the department of dentistry medicine and psychology of the University of Pennsylvania Workers in this field, says Dr. Goodfriend, have established the importance of abnormalities of dental bite in producing certain hearing troubles "as thoroughly as Koch proved that the tubercle bacillus causes tuber Their studies point to dental treatment as culous. the proper therapy
Anatomic studies show that any abnormality of

dental bite directly affects the custachian tube which brings about communication between the middle ear and the pharynx by adjusting air pres-sure in the middle ear to that of the air outside. Dr Goodfriend s article does not claim that some such condition is at the root of every hearing defect nor that the one automatically brings about the other But it does state that such abnormalities "probably influence about 40 per cent of all deafness.

Dr Goodfriend found that at the University's special car and throat clinic, 23 of the first 25 patients with hearing complaints but without any abnormalities in the ear itself showed abnormalities of bite or some position of the teeth which inter fered with proper movements of the jaw in chewing.

Studies of a group of 168 dental students showed that 55 per cent had dental malocclusions the bear ing of this group was 13 per cent less than that of the other 45 per cent.

# USEFUL PROCEDURES IN EARLY DIAGNOSIS OF LIVER DAMAGE FOLLOWING EXPOSURE TO THE CHLORINATED HYDROCARBONS

RAMSDELL GURNEY, M D, Buffalo, New York

# TETRACHLORETHANE, CHCl., 18 a color-CHCl.

less, volatile, noninflammable liquid with an odor resembling carbon tetrachloride. It is an extremely efficient solvent, but its toxic properties have prevented its widespread use in industry

During the first World War, Willcox in England investigated the cause of jaundice in 11 employees at the Hendon Aeroplane Factory 1 Gastrointestinal complaints and drowsiness were the chief symptoms Similar cases were found at Crayford and a seaplane factory Willcox exposed rats to the various constituents present in the "dope" used on the wings of the planes, and found that although acetone, benzene, and methylated spirits resulted in drowsiness, recovery was rapid upon removal from exposure and no abnormal findings were found at postmortem However, after a similar exposure to tetrachlorethane, fatty degeneration and cloudy swelling were present in the livers of the exposed rats Willcox concluded that tetrachlorethane was the toxic agent in the material used Further study showed that tetrachlorethane weight for weight was 2.8 times as toxic as chloroform

Because of its volatility (boiling point 146 F), inhalation is by far the most common means of intoxication, although toxic effects after absorption through the skin² and gastrointestinal tract have been reported

During World War II it was thought wise to impregnate all articles of clothing worn by the soldiers with a substance capable of neutralizing poisonous gases. No solvent for this substance was found that could compare in efficiency with tetrachlorethane. Hence, in spite of its toxicity, war necessity required the use of tetrachlorethane in the impregnating process.

The findings reported in this paper are based on experience obtained during the war years in a plant actively engaged in impregnating clothes and employing approximately 275 men and women.

Protection of the employees resolved itself into three main approaches first, engineering controls in the plant adequate to keep the amount of tetrachlorethane in the atmosphere at a safe concentration (most authorities agree that ten parts per million is the maximum safe concentration for

Presented at the 141st Annual Meeting of the Medical Society of the State of New York, Buffalo, Section on Industrial Medicine and Surgery, May 7, 1947 prolonged exposure), second, control of the employee through selection and supervision, and third, diagnosis of early intoxication so that further exposure, which may result in irreversible damage, can be prevented

The specific gravity of tetrachlorethane is 1 600-1 602. When cool the vapor will sink to the ground, but will rise on warming. Thus, the temperature of the gas is an important consideration in any plan for an adequate ventilation program.

In the process of impregnation with which this paper is concerned, the clothes, following impregnation, were chuted through a tunnel to drying Following the drying period the clothes were placed on tables for sorting The danger points, where maximum concentrations of the gas were found, were around the impregnating tanks, drying ovens, and the tables Exhaust funnels consequently were placed adjacent to the tanks and ovens and on the edges of the tables Careful consideration had to be given to the placing of the exhaust pipes outside the building so that the vapor would not be blown back into the Leaks and spills could not be avoided, so determinations of gas concentration in the working areas were performed at regular intervals

No ventilation system was found adequate to reduce the concentration of tetrachlorethane to safe levels immediately adjacent to the impregnating tanks or drying ovens. For this reason gas masks were provided for all employees engaged in work in these areas. Frequent testing of the masks and supervision to insure the wearing of the masks were necessary.

Applicants were selected for employment only after a careful history, physical examination, and laboratory study. Any disease or condition which might be augmented by tetrachlorethane exposure or which could lower the employees' resistance to exposure resulted automatically in exclusion. Applicants with a history of alcoholism or with evidence of previous disease of the liver, or of the gastrointestinal tract, the luetic under arsenic therapy, the anemic, those with kidney disease, and those pregnant were eliminated as poor risks.

Because of the protection against toxins afforded the liver by protein and carbohydrate, considerable emphasis was put on the dietary history of applicants for positions in the tetrachlorethane plant. It was found that much time was saved by having prospective employees fill out a

simple dictary form inducating their usual daily diet. On the basis of this form suggestions were made in their dictary habits.

The emotional stability of the applicant and his innate intelligence were found to be factors worthy of serious consideration. Each prospective employee was told the nature of his work and the hazard involved. The necessity for the utmost regard for such hygionic rules as wearing gauntiets when handling the chemical agents or contaminated materials, and a shower and change of clothes at the end of the shift was pointed out. Understanding the reason for these rules and a willingness to obey them was required of each applicant. A policy of frankness seemed to be appreciated by all employees and resulted in good comeration.

The sex and age of the applicant should be taken into consideration. In a study of the relationship of sex and age to incidence of intexaction, men appear to be less susceptible than women as judged by the fact that of 158 women employed 39 (24 per cent) showed evidence of intexication in contrast to 15 (12 per cent) of 119 men employees. Equally striking figures were evident in comparing the various age groups. Nine per cent of those 30 years or under showed evidence of intexication in contrast to 28 and 29 per cent in the older age groups (see Table 1) Thus, young men appear to be least susceptible to intexication following tetrachlorethane exposure

TABLE 1.—Incidence of Intoxication in Relation to

		-Age Group	
	30 Years		
	or Less	21-00 X cats	51-70 Years
Number with evi- dence of interies- tion	12 (9%)	\$3 (~9.97)	10 (25%)
Total number in age group	122	112	35

At the mitial history and physical examination a complete blood count, sedimentation rate, urn alysis, and Wassermann test were performed on all applicants in order to determine the presence of any disease otherwise not evident and because of which disease the applicant's health might be further impaired on exposure to tetrachlorethane.

The diagnosis of early intoxication was the third part of the program instituted in the impregnation plant. In spite of the excellent cooperation on the part of the supervisors and every effort to enforce the essential rules mentioned above, cases of intoxication developed. Occasionally such cases were discovered to be related to some unwise practice, yet many other cases occurred without any apparent reason other than continuous exposure for eight hours in a contaminated atmosphere.

Careful interval histories taken on 277 em ployees showed that 27 per cent acquired symptoms referable to the nervous system or the gastrointestanal tract or both. It is realized that such symptoms not infrequently occur in any group of people, however, the frequent association of these symptoms with other signs of in toxication, and their disappearance upon removal from the contaminated atmosphere suggested they should be given special consideration and further studies carried out. The employee was assured that another job would be available for him if removal from the impregnating plant was found necessary. This practice discouraged the concealment of symptoms.

As limited facilities prevented periodic examinations more often than once a month, a nurse inspected the workers at the plant each day and several times detected clinical jaundice unrecognized by the employee. Her immediate presence in a friendly informal atmosphere likewise encouraged the reporting of symptoms. In addition it was her duty to pay home visits to all employees absent from work because of illness. The doctor made a follow up visit if any of the symptoms or signs suggested tetrachlorethane intorication

The angle physical finding of the most importance, aside from clinical jaundice, was enlargement of the liver Of the 55 or 19 per cent of all employees who acquired enlarged livers, 26 or 47 per cent of this 55 had no associated symptoms whatsoever 4

Of the various laboratory procedures available for determination of liver function, the level of bile pigments in the blood, a rough quantitative estimation of the urobilinogen in the urine and the cephalin flocculation test seemed most practical. None required special preparation of the patient and a single collection of blood and urine was all that was required

Elevation of the bile pigments above normal but below the level of clinical jaundice occurred in 10 employees. The association of such a rise with liver enlargement or symptoms, or the return to normal of the bile pigment level after release from the plant, suggested such elevation was significant.

The cephalm flocculation test proved to be of considerable assistance in furnishing additional ovidence of liver damage (Table 2) Of all cases showing definite evidence of liver damage only 3 had negative flocculation tests. Five machine

workers developed 3 or 4 plus flocculation tests without other symptoms or signs, suggesting that occasionally this test may be the first evidence of liver damage The relation of positive flocculation tests to hyperbilirubinemia was studied on 16 cases with definite evidence of liver involve-In 7 of these cases the flocculation test became negative before the bile pigment level returned to normal In 6 cases the flocculation test became negative at the same time that the bile pigments fell to a normal level In 3 cases the flocculation test remained positive after the bile pigments had returned to a normal level

The prothrombin time, sedimentation rate, and Takata-Ara tests were performed from time to time, but seemed to be of less value than the other

tests employed

### Summary and Conclusions

Tetrachlorethane is an extremely hazardous In spite of expert engineering advice and careful medical selection and control, symptoms suggesting intoxication appeared in 75, or 27 per cent, of 277 employees exposed to the fumes of this substance for an eight-hour working In addition 55, or 19 per cent, of the 277 employees acquired palpable livers Further, 8 employees showed elevation of bile pigments in the urine or blood without clinical jaundice or recognizable liver enlargement, and 4 acquired 3 or 4 plus cephalin flocculation tests without other symptoms or signs

These findings permit the following conclu-

sions

- Prolonged exposure to tetrachlorethane vapor, held for the most part within the permitted limits of concentration, will result in symptoms and signs of intoxication in certain employees Thus, the maximum "safe" concentration level should be revised downward
- Careful supervision of employees to assure obedience to hygienic rules and safety measures is An explanation to the employees of the nature of the hazard and the necessity for these safety measures was found helpful
- A careful initial history and physical examination with laboratory studies should be performed on all applicants in order to exclude those who are poor risks
- Frequent periodic examination must be performed on all employees Nervous or gastrointestinal symptoms may be the first manifestations of incipient intoxication Careful examinations for evidence of liver enlargement are necessary as this may be the first sign of intoxication Simple laboratory studies, such as determination of the level of bile pigments in the blood or urine, and the cephalin flocculation test were found very helpful both as diagnostic and prognostic procedures

### A.M A. WILL HONOR GENERAL PRACTITIONER BY GOLD MEDAL

The Board of Trustees of the American Medical Association has established a special gold medal for a general practitioner who has rendered exceptional service to his community

The award, similar to the American Medical Association's Distinguished Service Medal which has been given annually since 1938 for scientific advancement in the field of medicine, will be given to a general practitioner for the first time at the supplemental session of the House of Delegates at Cleveland, Ohio,

on January 7, 1948

Designed especially for the physician who has served his people as a family doctor and who does not devote himself exclusively to a specialty in medione, the award will be known as "the medal of the American Medical Association for exceptional serv-

ice by a general practitioner"

Nominations for the award may be submitted to the headquarters office of the American Medical Association in Chicago by any state medical association or community service club, such as a Rotary, Kiwanis or Lions Club, Chamber of Commerce, woman's club, community council or similar group The nomination should include the name and address of the physician, his scholastic record, and a record of his medical service in the community

Nominations will be submitted to the executive committee of the Section on General Practice of Medicine of the American Medical Association, which is composed of Dr Wingate M Johnson, Winston-Salem, North Carolina, Dr Paul A Davis, Akron, Ohio, and Dr E A Royston, Los Angeles This committee will select five leading candidates for nomination for submission to the Board of Trustees, which, in turn, will nominate three of these to the House of Delegates

On the opening day's meeting at the supplemental session the House of Delegates will choose by ballot the general practitioner who will receive the

medal.

#### CERTAIN REASONS FOR FAILURE FOLLOWING DISK OPERATIONS

ELDRIDGE CAMPBELL, M D, and ROBERT D WHITFIELD M D, Albany, New York

(From the Department of Surgery Albany Medical College)

THE discovery of the role of the herniated intervertebral disk in the production of low back pain and sciatica, as well as the development of an operation for its correction, has aroused great interest in this syndrome. The clinical picture has been clarified and publicized considerably, with the result that the diagnosis of ruptured intervertebral disk is commonplace The splendid results reported by Dandy and Mixter soon popularized the operation, which is today performed with varying success by many surgeons While, on the whole, the results have been good, there have been so many exceptions that it is obviously time to pause, take stock and to discover, if we can how in one case we succeed when in an almost exactly similar situation we fail.

With this in mind we have restudied 106 patients operated upon by us in the Albany Hospital from 1937 through 1945, 122 of whom have returned recently for re-examination. Particular attention was given to the relief of pain, the increase or decrease of neurologic deficits, clinical and roentgenologic evidence of spinal fixation and muscle spasm, and finally, but of most importance, the patient's ability to return to his former occupation. This particular series consists entirely of patients who came to operation, but does not include the many believed to have had ruptured disks, who for one reason or another, were not operated upon

The results are summarized in Table 1 Sixtyeight patients were classed as "excellent," since
they were free from pain and had returned to
their former occupations, 33 were termed "good"
because they were doing lighter work without
pain or the same work with some discemfort,
and 21 were considered "poor" In this last
category were included all those who were, or
claimed to be, disabled because of continued
pain or weakness

# Factors Which May Influence the Type of Result

From a comparison of the three groups (Table 1) it appears that the average age and the preoperative duration of symptoms were not signicantly at variance in any Similar also was the
incidence of objective neurologic changes before
operation in the "excellent" and "good" groups,

whereas such changes were present in but twothirds of the "poor" group Spasm of the sacrespinalis muscles, flattening and limitation of motion of the lower lumbar spine and impaired straight leg raising were for sake of brevity termed "orthopedie" changes These were present in varying degree in most instances in all three groups. In this series therefore we have no evidence that any of these factors, save perhaps the lack of preoperative objective neurologic changes, played a part in the failures

Our experience, unlike that of some, has been that Workmen's Compensation plays a decidedly important role in many instances. Fig 1 shows in graphic form the comparative results of those with and without this form of insurance. It is evident, even in this small series, that those insured comprise a far less satisfactory group than those not insured. The fact that of the 21 "poor" results, 19 were "compensation cases" is striking particularly in view of the fact that in this series 70 of the 122 were not insured.

Psychologic Risk — Each patient was assessed by one of us and occasionally by a consulting neuropsychiatrist as to whether or not he was a good risk from the standpoint of his morale. These we divided into three classes "good," fair" and "poor" Particular attention was directed toward the patient's emotional stability his nervousness, his apparent ability to stand pain, his previous history of neurosis, and his degree of resentment, if any, toward his employer or insurance carrier. While the exactness of such an estimate, particularly by a surgeon untrained in the principles of psychiatry, is

Presented at the 141st Annual Mosting of the Medical Society of the State of New York, Buffalo, Section on Industrial Medicine and Surgery May 7 1947

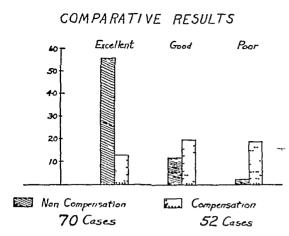

Fig 1

open to question, it would appear to be definitely significant that 13 of the 21 poor results occurred in individuals rated as "poor" psychologic risks

in individuals rated as "poor" psychologic risks

Influence of Disk Level—From this small series it is apparent that the proportion of "excellent" and "good" results were roughly the same whether the fourth or fifth disks were involved However, the fact that there were almost twice as many failures (as listed under "poor" results) at the L4—5 as at the L5 S1 level, suggests that the outlook may not be quite so favorable with the former disk

Type of Disk Pathology—In this study, the disk changes found at operation were considered under two headings First, protrusion with sequestration, and second, protrusion without sequestration In the "excellent" group 23 of the 68 were sequestrated, in the "good" group 7 of the 33, and in the "poor" 6 of the 21 were sequestrated. The actual number of cases falling into these three classifications is so small that percentage comparisons are not justifiable, however, it is evident that the proportions are so nearly the same that the slight differences are statistically insignificant.

### Postoperative Findings

Neurologic Defects —A study of the incidence of objective neurologic changes, such as absent or decreased knee or ankle jerks, areas of anesthesia or hypesthesia, and/or motor weakness, revealed, surprisingly enough, that, save for more severe degrees of motor weakness, these factors were not of overwhelming importance in determining the type of result obtained. Thus, 44 of the 68 "excellent" result cases, and 30 of the 33 "good" result cases presented postoperative neurologic changes which persisted for a year or more. Persistent pain or motor weakness of embarrassing degree caused us to classify any patient with this degree of disability.

among the "poor" group However, the persistent loss or decrease of a deep reflex or the presence of an area of anesthesia or hypesthesia by no means precludes an "excellent" or "good" result

Extradural Spinal Fluid Cysts—These, with demonstrable subarachnoidal communications, occurred after three of the earlier transdural operations. In each the pain came on soon after assuming the erect posture, coincident with which fluoroscopic myelography demonstrated contrast media entering the sac (Figs 2, 3). In 2 cases the fistula was successfully repaired at a second operation, while in another patient two attempts were unsuccessful and the result must be considered a failure.

Fixation of Lumbar Spine—This, with or without palpable spasm of the sacrospinalis muscles, was observed in the vast majority of the "poor" and "good" result cases, whereas it was present in less than half of those with "excellent" results. Thus it would appear that while a more or less rigid lumbar spine by no means precludes an "excellent" result, it is more often associated with a less favorable outcome

It would be helpful to know how much of the fixation was due to bony and/or ligamentous changes and how much to muscle spasm. At some future time, we hope to be able to present our experience in this regard

Increased Narrowing of the Disk—This was demonstrated, roentgenographically, in 26 of the

Fro 2 Lipiodol entering postoperative extradural arachnoidal cyst

Fig. 3 Myelogram showing postoperative arach noidal cyst (area of lessened density) and recurrent disk (filling defect)

39 patients from one to nine years after operation (Figs 4, 5) The remainder of the eases have not yet been re-examined in this fashion. The num ber in each category was thus too small to be of statistical importance. It is hoped that more data will be available soon.

#### Comment

On the basis of our experience we believe that accurate preoperative study and diagnosis, together with careful evaluation of the individual patient's morale are factors of such great importance that they hardly can be overemphasized In the selection of patients for operation it is well to remember the natural history of this disorder that periods of remissions characterize many cases, and that some of these may go for months or years with few or no symptoms. Many of the milder cases do not require operation and, indeed are just as well off without it Many will respond to conservative treatment, to some support to the back, and to the placing of bed boards under the mattress From a psychologic standpoint it is far better to operate when the patient is having an exacerbation of his pain and disability, rather than when he is in a remission. Furthermore it is unwise to promise or to assure any patient that he will have a perfect back after operation.

The clinical picture of a ruptured intervertebral disk is so commonplace, and in many instances the diagnosis is so obvious that one must be constantly on guard if the less common disorders producing low back pain and sciatica are not to be missed. Common among these are cauda equina tumors, such as neurofibromata, metastatic lesions, certain gynecologic conditions, esteoarthritis and hip disease. Just recently we studied a young woman who had been operated upon elsewhere with the diagnosis of a ruptured intervertebral disk, who was unrelleved of her pain, and who, when we saw her a few months later, presented an obvious esteosarcoma of the upper and of the femur.

#### Myelography

While in most instances the diagnosis of a ruptured disk may be made with reasonable assurance without the aid of contrast media, myelography can now be done with such ease and harmlessness that we have carried it out almost routinely. In many of the earlier cases lipiodol was used. Much controversy, now academic, has taken place concerning this agent. Since it has been available pantopaque has been utilized because of its superior delineation of defects and the greater ease of its removal. While the procedure of myelography is not diagnostically infallible it does give one assurance in most

Fig. 4 Roentgenogram of lumbar spine showing preoperative narrowing of lumbosacral disk.

Fig 5 Roentgenogram of lumbar spine showing increased narrowing of lumbosacral disk six years after operation

instances as to the existence and the location of the disk. It is true that we have found ruptured disks in some patients who had apparently normal myelograms and vice versa, and have occasionally not found protrusions in some who were thus diagnosed by myelogram. By and large the procedure has been well worth while. Furthermore, certain double disks (particularly if the unsuspected second one is contralaterally situated), certain tumors, and a few completely sequestrated bits of disk tissue, which have slipped either well above or well below the disk level, might have been missed without its use

### Summary and Conclusions

A series of 122 patients operated upon one to nine years ago for removal of a ruptured intervertebral disk were personally restudied. Based upon absence of pain and ability to return to original work, 68 were classified as having obtained "excellent" results. Twenty-one patients were termed "poor" result cases since they had not returned to work and since they complained either of pain or of motor weakness which prevented their resuming their usual activities. It is of interest, and apparently of significance, that 19 of this group of 21 came under Workmen's Compensation, while 13 were considered before operation to be poor psychologic risks. In some cases, however, the reasons for failure were per-

sistent neurologic defects, such as motor weakness and obvious pain. It is believed that at least three or four of this group have recurrences, but they have refused further procedures thus far. It is noteworthy that certain persistent postoperative neurologic defects, such as absent or diminished knee or ankle jerks, or persistent areas of hypesthesia or even anesthesia, do not necessarily preclude an "excellent" or "good" result

If the patient has had bilateral sciatica we believe that it is worth while exploring the disk on both sides of the spinous process, since, in our experience, it has sometimes been impossible to decompress the opposite root from one side satis-We also believe that one should operfactorily ate only on those individuals who cannot get along with conservative treatment, and if operation be performed, that it be carried out at a time when the patient is having pain or disability, rather than when he is in a remission Furthermore, it is of great importance to reserve operation for those individuals who are in very real pain, who are disabled and who are anxious both to get well and to work again

### Discussion

Dr Howard L Prince, Rochester, New York—This interesting paper is of a type much needed by the profession at large. One of the legitimate criticisms of surgeons is the tendency of all to start doing some type of operation long before the originators have discovered the difficulties. Another of our faults is the often delayed reports of these difficulties by the originators. Then, too, the parent of an idea is likely to be no more trustworthy in his evaluation of its virtues than the parent of a physical child. One must ask the neighbors or relatives.

I have been wandering in the maze of "The Back Problem" for about thirty-five years now and feel that, while perhaps I really know more about it now, I know that I am not so sure of it as years ago first came under the impress of Joel Goldthwaite. In former days, if the pain was limited to the low back it was lumbosacral strain If the sciatic distribution bothered, it was sacroiliac distortion. One read the x-rays and, if from Boston, manipulated accordingly, but if from Hopkins and Baer, all were manipulated the same True, we did obtain some astonishing results, but the failures piled up arrived the idea of fusing the sacroiliac or the lumbosacral regions and, not infrequently, one after the Here again we had good results, and by the time we learned that many of the results did not last we had left a train of operative scars across the country The Canadian neighbors always remained rather skeptical, especially of sacroiliac diagnosis and operation Along with the operative successes there continued a lot of failures But failures easily pass into oblivion or other doctor's hands, some wearing the belts and/or backbraces we have applied after operation and getting along with the feeling that their back pain is a cross they have to

bear and make the best of And always the compensation insurance companies were finding that they were carrying a very high percentage of failures.

Then came the very careful work of Mixter and his follows with its great promise of relief for some cases carefully chosen with cooperation of surgeon, radiologist and neurologist. Long before any prolonged or intensive study of results could be made disk operations became common, their confidence and danger enormously enlarged by Dandy's reports that all that was needed was a history of recurrent sciatic attacks. Not only was the spinogram unnecessary but it was in fact useless and possibly dangerous. With the history one opened the back and wherever one found a spinous process too wiggly, one went farther and if no protruding disk was found at this level there was something just as good, namely a hidden disk. This made the whole thing simple. Dandy's early reports under this reasoning were 100 per cent perfect results, and it took several years for him to find any reasonable percentage of failures and tell about them by that time disk operators were numerous. We never seem to learn from experience. At an early meeting of the American Academy of Orthopedica, in a symposium on low back problems. I suggested that it would be a wise thing to allow the disk opera tion to remain in the hands of a few men best qualified until more was known about it, although I felt that this was very unlikely Once more the insurance companies are more impressed by failures than successes. Every one of us who have done these operations is impressed by this disproportion in our results. And yet the good results are in a discouraging percentage. We see report of good results from 80 per cent down. Dr Campbell in a careful study finds 55 per cent. This is too wide a range not to call for more study Of his 21 failures, 19 were industrial cases and 76 per cent of these were of the hidden variety. In my very limited operative experience one hidden disk was cured and one no better a matter of 50 per cent. I did a few of these cases while our neurosurgeons were in the service but have bowed out with thanks since they got back. My limited experience leads me to feel that the more damage you find the better are your results. This is so generally in surgery

Why are results so variable in an almost purely anatomic situation? I shall only express my own conclusions.

First is the difficulty of diagnosis. I am sure that disk injuries are very common and that most of them never require surgery. They get along very well at the expense of occasional bouts of back ache and sciatics for which they take maybe a short parlod in bed and some of numerous treatments, medical oscopathic, etc. They have perfect histories and findings except for neurologic findings which take a little more time to develop. Of those who go on and develop the whole picture associated with inability to carry on positive neurologic findings and a completely positive spinogram, there will be a certain number who show nothing at operation even in the hands of skilled neurosurgeons

And here I want to say that to my mind this work belongs to the skilled neurosurgeon and not to those who dabble in it. The opportunities to do irreparable damage are close to the trail, and as we have seen, the report of hidden disk, hypertrophical alar ligaments varioese veins, etc., are generally unsatisfactory to all concerned. Occasionally, the patient is cured, but that happens in every cult of healing Only ours seeks the percentages and strives to better them through more knowledge. Perhaps our greatest weakness lies in our general failure to question some of our results with the same searching enthusiasm that we have applied elsewhere. How much farther would we have been in psychosomatic medicine?

Second is the question To fuse or not? This is a problem. It offers more trauma to a patient who may have had enough. I have been on both sides of the fence and am not too sure of my stand now In general it seems unnecessary In those cases where nothing is found fusion may give good results. Let us not forget that it has undoubtedly done the trick in many cases in the past. Also in those cases where much motion between vertebrae is found and in spondylolisthesis is present despite Dandy's assurance that this is unnecessary Always remember that fusion in the lumbosacral area is not a certain procedure. The exact technic is not yet deeided. To get the best results requires exactness and care with any technic, and anatomic anomalies, so frequent in this region, may vastly increase the already difficult problem.

Third is the question Why are the results in industrial cases so generally poorer than in the nonindustrial?

One reason may lie in the almost universally deteriorating effect of insurance on the ethics of the human race as seen in the general desire to collect insurance money long after any real disability has been present. However I believe this is not one of the important reasons. Too many industrial phy sicians and those working with industrial patients are inclined to minimise complaints and to try to get these folks back to work too soon and with no change in the work they were doing. Hurt backs need rest and going to the doctor's office every day or so over varying distances for treatments is not rest. As far as my knowledge goes there are no treatments worth it. Then these patients with back injuries hear from too many people some of whom are unfortunately doctors that back injuries do not get better Each hearing they attend, in our present hearing room setup confirms them in this idea. Another important thing to know is the comparable occupational strain in industrial and nonindustrial cases. I am very doubtful as to the wisdom of sending any disk case back to the heaviest types of labor This presents a labor management problem difficult to solve especially in smaller plants.

Another possibility for physicians is the getting over to these patients that life and work with some discomfort are competible and fairly common Many of them have few resources beyond labor

### PSYCHOTHERAPY OF THE OBESE PATIENT

HENRY B RICHARDSON, MD, New York City

(From the New York Hospital and the Department of Medicine, Cornell University Medical College)

THE following remarks are limited to obesity of the exogenous type, mainly as it is encountered in women. The discussion refers to individual treatment as carried out by the practitioner under the usual conditions of a medical visit. Space does not permit the discussion of other important factors, such as family relationships, or the influence of the personal, social, or economic environment.

The only way in which fat or its precursors can enter the body of the obese person is through the mouth. Fat is deposited in the tissues only when the calories of food which are absorbed through the intestinal wall exceed those which are utilized in the production of energy Obesity of all types is the result of a disturbance in the caloric bal-The patient who says-"I didn't eat nothing, doctor, and still I can't reduce"—is invoking magic, and expects a magical cure search in metabolism and endocrinology have given little indication as to how the calone balance is tipped in favor of the accumulation of fat The question, which is still to be clarified, is why the obese person eats more than she can oxidize. The fundamental questions have not been answered "What does the disease do to the patient? What does it do for the patient? How come? What to do, and how to do it?"

The only person who can supply the answers to this question is the patient. On suitable inquiry a number of motives for excessive eating can be elicited, in addition to the appetite. This is usually increased, but zest for food may be totally absent. Perhaps the most frequent complaint is a feeling of emptiness, a boundless void, which can never be filled, or which recurs immediately after eating. This feeling is intensified in situations of emotional stress. Thus it is out of proportion to the physiologic needs, and, therefore, is not so much an appetite as a craying.

In addition to the emptiness, other symptoms come to light sooner or later, resentment, guilt, self-depreciation, loss of the savor of life, and outright depression, sometimes with thoughts of suicide. Anxiety is shown by panicky sensations, inability to get a deep breath, and tightness in the throat. Gastrointestinal symptoms are common, and in older women hypertension, or attacks of anginoid pain, which is indistinguishable from coronary insufficiency.

It is clear then what the disorder does to the obese patient. It functions as a disease, in that it causes suffering, and interferes with the life adjustment. It is clear also that the illness does something for the patient, it constitutes a psychologic gain. The existence of this gain can be inferred from the manner in which the patient resists treatment, in fact it is the crux, both of the illness and of its treatment. Sometimes the gain is obvious, as when obesity is used as a way of avoiding men and marriage.

Psychiatric observation in a few cases has thrown light on this psychologic gain 1-3. The early origin of the disorder is shown in some instances by the fact that the obesity begins in the first year of life. The fundamental drive is the desire of the patient to regain the love and affectionate care which was hers without the asking when she was an infant. She has come to feel deprived of this affection and strives to compensate for the deprivation by overeating. Later this drive becomes fused with the reproductive instinct. One patient expressed this very clearly

When she eats, she says, she puts on fat around her middle, and immediately wonders, regardless of her intellect, whether she is pregnant. She has passed her menopause, and the prospect of pregnancy is remote. She has become constipated, felt "all bloated up," and wondered if she could possibly be pregnant. Even as she talks about it she feels "all puffed up in the middle." She has this feeling every time she puts on weight. Thus, she adopted a neurotic compromise by which she became pregnant in a symbolic manner by utilizing the childhood notion that impregnation takes place by way of mouth, and that pregnancy and childbirth are functions of the gastrointestinal tract.

This patient is cited to indicate that eating and the accumulation of fat in the obese woman are an integral part of a personality disturbance dating from early childhood. If this is true, the reduction of weight is only part of the treatment. The psychotherapy of the obesity, in turn, is an example of a larger problem, the treatment of the various neuroses which are encountered in medical practice. These are met nearly as often in patients with organic disease as they are in so-called functional disorders.

Symptoms such as these indicate a need for psychotherapy. The simplest form of this makes use of the emotional attitude of the patient toward her physician and his medical or dietary.

Presented at the 141st Annual Meeting of the Medical Society of the State of New York, Buffalo Section on Medicine May 9, 1947

treatment. Many doctors are skillful in this type of therapy, often without being aware of what they are doing or why It would be very useful to know how they accomplish their results

Unfortunately, psychotherapy of this type is limited in its scope. Most patients require more intensive treatment, which consists in the deliberate application of the principles of psychiatric treatment to clinical mediane. My own technic corresponds closely to the "associative anamnesis" of Felix Deutsch, 4-4 and this again to social interviewing" as carried on in social service and family case work. The similarity of these technics indicates that they are based on the same fundamental principles.

The therapist wants to know what kind of facts are useful, and how to get at them. In addition to the medical and blographic data, he needs to know the exact words in which the patient expresses them, the order in which she brings up topics for discussion, and the relation of the illness to her life history. In other words, he wants to know the spontaneous associations between the physical aspects of her illness and its mental and emotional components. Such associations are the only direct evidence for the relationship, in either direction, between mind and body

The thempist wants to know that he is getting facts, not artefacts. For this reason he avoids leading questions. He will find also that he can best make the patient talk by doing this. Moreover, he thereby leaves the patient free to form her own associations.

How does he know that the associations are significant? In the first place, all associations are significant to some degree provided that they are spontaneous Furthermore, the patient will often betray their importance by her emotional reaction She may resent the association and belittle it. She may have an exacerbation of symptoms then and there, like the patient who felt "all puffed up when she talked of pregnancy she may change the subject abruptly and talk about her previous symptoms. In so doing she is saying in effect "Oh no it's not the relation of mental stress to the illness which is important, it is the physical aspects." Thus, she is dimly aware of the significance of the association, and attempts to evade or minimize it, as in the case to be related. In all these instances the patient behaves much like the nesting bird, which pretends to be crippled in order to lead the intruder away from her eggs.

Such an interview is essentially a conversation and should have the attributes of good conversation in general. It is as far removed as possible from the question-and-answer of the routine medical history. The principle was well expressed.

by a patient, who said, "He was a good doctor, he listened " The initiative is left with the patient, but the direction is supplied from time to time by the doctor The latter remains silent until he has a reason for saying something Occasionally, he supplies a verbal stimulus or takes advantage of the patient's most recent statement to direct the conversation into productive chan nels. For instance, if the patient says something important, he can merely repeat a phrase with the inflection of a question Or he may say, "I don't quite understand,' or "Why did you say or do this?" If it is a first interview, he may utilize the pause to get medical data. If nothing is forth coming by the above methods, he can use his in genuity He may make general statements about how people feel, or cite anecdotes, or quotations, or phrases from the vernacular If the patient stops talking it is often effective to sit quietly and say nothing She may resume the conversation or perhaps respond to the query, "What are you thinking about?"

The use of the interview may be illustrated in the following case

Miss C K, came to me in December 1946 because of obesity. She was in her early twenties weighed 147 pounds and was 5 feet 61/2 inches in height. She was in good physical health, and examination showed only obesity which was most noticeable in the abdomen, hips and thighs. She has a variety of nervous symptoms to be illustrated later, together with gastrointestinal disturbances at times and on two occasions momentary periods of faintness which lasted a split second. These occurred at times when her blood sugar might have been low She came from a large city in the Middle West and of a family who were formerly in comfortable circumstances. She is the youngest of six siblings and has a married sister who is the mother of two children. She was "skinny' as a baby began to be fat at nine years and at the age of 17 she reached her maximum weight of 165 pounds She was the first to take seriously the peculiar behavior of her mother who was found to be a schizophrenic. The patient insisted on hospital care which was expensive and accomplished nothing She felt responsible for the family dissensions and financial difficulties which were the result of this To help meet the expense she left college gave up her ambition to become an artist and took a job in an accountant soffice Later she took a similar job in New York City It was at this time that her weight increased

The above summary of the biographic data was the result of five interviews. Her difficulties emerged gradually and became clearly outlined at the aixth visit. The following conversation is reproduced from long-hand notes. My part in the conversation is indicated by parentheses.

She postponed the previous appointment because

she had to move (Yes?) Things are going very badly, she broke her diet. It began Christmas day (Does she feel rueful?) Yes Everywhere she went they had to eat. She had been getting dizzy spells and felt sick. (Dizzy?) Also her

nerves were on edge

On New Year's Eve she was in one of her moods, did not give a darn. She was angry at something, no one had a good time, they had a little spat. The man and his mother had been respectful to her, but he arrived an hour late for a double date, waiting for the other girl to telephone, also he refused to leave her gift at his mother's house and they both became angry. (Was it a gift for his mother?) It was not for him. She planned a gift for him but didn't want to tell him, then she got angry and thought it didn't matter. Then she asks what bearing it has on her eating. (As a matter of fact did not she eat more?) She ate because she was bored.

She then questioned my taking notes, also the purpose of finding out what makes her eat eats when she is depressed Otherwise she can control her appetite If she is busy she doesn't think about food Don't we all get depressed? does she feel?) I get an empty feeling (What is empty?) A feeling of anxiety (A physical feeling?) It feels as though there were a clock-work in her chest, like the clock on the desk, and a lump in the (When?) She felt that way when she moved, and when she was out New Year's Eve It is a feeling of insecurity Other people moving on New Year's Eve might feel insecure (Some people might enjoy moving) She did until she said goodbye to people She had that same feeling on coming to New York from another city (Did she put on weight then?) Yes New Year's Eve should be spent with friends (She did not want to go with this man?) No She then reverts immediately to a discussion of her weight

She discusses her diet and says, "I wasn't such a bad girl" (I suppose you would like me to scold you) She is her own policeman, it is her conscience

Comment on Internew—It is significant to note that her compulsion to overeat was associated with moving and was the same feeling which she had previously on leaving her home city. Note also the fact that her escort was not the right man. This discussion led immediately to resistance, everybody has anxiety, it is natural to react that way, etc. She brings out a sensation of anxiety, a hollow place inside, and a feeling of depression, it is only during the latter that she is unable to control her appetite. Overeating is evidently the reaction, first, to loss of a dependent

It was not until two weeks later that she again discussed men She had been engaged previously and was evidently in love with her former fiance Recently he had visited her parents with her, and

position of security, and, second, to her relation

to men Apparently there is more to follow on the

latter point

had broken off the engagement, giving as a reason the difference in background between the two families. This difference was not at all obvious to me, and the patient agreed with me that it was an excuse for his indecision about marriage. Subsequently, he had attempted to revive the engagement. She was rightly concerned as to whether he could meet the responsibilities of marriage in the way in which she expected. She wanted someone to lean on, and someone to make decisions. With this proviso she was prepared to marry and to raise a family as soon as possible.

This patient shows clearly the association of obesity with anxiety, feelings of guilt, and depression. Her obesity recurred in two situations those in which she had to assume responsibility, and those in which she was frustrated. Both elements were combined in the question of marnage with the vacillating suitor.

That the question of marriage was the focal point of her emotional difficulties was evident from her long delay in discussing the problem. It would be too much of a simplification, however, to suppose that the whole difficulty was due to the suitor. It remains to be explained why she was attracted to him, rather than to the type of man whom she required as a husband. The choice of a mate is the most accurate indication of adjusted behavior or the reverse. To judge from other obese women, like the one I quoted earlier in this paper, the same psychologic drive which produced the obesity could be responsible for her choice of an inadequate suitor.

The patient took the dietary treatment into her own hands from the start. In eight visits at weekly intervals she reduced from 147 to 132 pounds, a total of 15 pounds. After her discussion of her love affair she declined further interviews, announcing that henceforth she could manage the reduction of weight by herself

No pressure was required to make her accept the diet As she said, she was her own policeman, it was her conscience. In other cases the question comes up as to how to influence the behavior of the patient, with respect to eating and to other problems. If a psychologic craving exists, no amount of exhortation or reasoning has any effect on it. The use of medical authority to enforce the diet, or predictions as to the bad effect of the obesity on health do not work much better Authority may succeed for the time being, but it is no guarantee against a relapse

To produce any fundamental change in the attitude and behavior of the patient, it is necessary to use the principles which I have described above. The technic is therapeutic as well as diagnostic, in that it permits the patient to gain insight into her own motives and behavior. The initiative for change must rest with the patient,

and all modifications of behavior should derive originally from her

Reduction of weight encounters obstacles in the form of vicious circles. One of these is physical, the greater the weight, the less the physical activity, and the less the activity, the greater the weight. This cycle is broken up mainly by the use of the diet. The dieting, however en counters another and more stubborn vicious cycle, which is psychologic It begins with a sense of deprivation at the hands of the parents This arouses resentment, which in turn evokes a sense of guilt and depression, these induce an unmanageable craving for food, which results in breaking the diet. Overeating intensifies the guilt, which induces more craving, and the cycle is repeated When a patient breaks diet, therefore the important thing is to help her see why she does it. Rather than assuming a punitive attitude, the therapist should try to ease the panes of her tyrannical conscience, or in psychiatric terms. to mitigate the harshness of her super-ego

For the foregoing reasons I do not think it expedient to use any but the mildest forms of pressure. The patient is suffering, coupled with her
visit to the doctor's office and the use of the
weighing machine, is enough. In some cases
where the personality disturbance is far more
damaging than the fat itself, it is best to omit the
discussion of the diet, at least for the time being
Such patients usually require prolonged psychia
time treatment.

An important part of the psychotherapy of obesity, as used in the case just described, was to permit the woman to unburden herself, and to see her problem in perspective This process includes the unfolding of her life history and its chronologic relationship to her obesity The visits also allowed her to verbalize her frustrations. In addition she was also able to express resentment in an atmosphere which was free of moralistic judgment. In her case the resentment was directed against her New Year's Eve escort, who committed the crime of being the wrong man Another patient might have directed her anger against someone who stood for the parent, or against the parent in person. Others might repress the resentment. In any event, the aim of the treatment is to bring the resentment to the surface, to demonstrate to the patient the person or persons against whom it is really directed, and to reduce it to its proper proportions. This process mitigates her sense of guilt and depression and permits her to acknowledge her more constructive emotions like affection for her family increased satisfaction in work, or interest in men leading to love and marriage. In married women it may lead to a happier married life When the emotional life is allowed to flow into natural channels, the compulsive quality of the eating diminishes. The ensuing reduction of weight is an index of improved adjustment. It is only under these conditions that the physician can have any confidence that the reduction of weight will be permanent.

Probably the most vital part of psychotherapy as I have described it, is to bring out and interpret the free associations of the patient which connect her emotional life with her excess drive for eating. It is only thus that she can acquire insight into her emotional life and behavior do so she requires help, because of the psychologic gain which is implicit in her illness, as in similar disorders, she resists treatment at the same time that she desires it. In other words, she resists anything which threatens her sense of se-Therefore, the therapist has to play a part through interpretation Indeed, he cannot avoid this If he says nothing the patient may construe his allence as approval or disapproval She will behave the same way with respect to his every word, movement, and facial expression

Interpretation is the chief tool of the psychotherapist and is a powerful force for good or evil The subtlety of the technic should not be allowed to obscure this fact. The success of the treatment depends on the skill with which interpretation is used Its effect for good or evil depends on the tome which is selected for interpretation, the time at which it is offered, and the terms in which it is expressed. It must not be given until the patient is prepared for it. Otherwise it may con front her with facts about herself which she can not tolerate. It is essential not to tear down a neurotic adjustment until a better one is provided. At best this angers the patient and causes her to stop treatment. At the worst it can lead to impulsive behavior which may be damaging to the patient, or in some conditions even precipitate a psychosis Unless the therapist is specially trained in dynamic psychiatry, he should make all his interpretations in an oblique, neutral, or a tentative form, and should minimize topics which are damaging to the emotional security and self esteem of the patient.

The power of interpretation, as well as the efficacy of psychotherapy as a whole, depends on the doctor-patient relationship. This is analogous to the situation which inevitably arises in psychoanalysis, where it is highly emotionalized. The patient puts the therapist in the position of a parental figure. This attitude of the patient is known as transference, and the reaction of the physician as counter-transference. The emotional impact is not so great in the medical situation, but it is much more intense than is usually realized. For instance, a woman received injections from a private physician for perindous ane-

mia, and was restored to health. One day he allowed his nurse to give the injection, which seemed to the patient to be equivalent of being abandoned by the physician. She neglected treatment for thirteen months, and came to the hospital in a severe relapse, which might have cost her her life.

The next question is also how far psychotherany should be carried in obesity, in what form, and by whom In some cases prolonged and exhaustive psychiatric treatment is necessary The decision depends on the severity of the personality disturbance in relation to the capacity of the patient to benefit by treatment For the practitioner the decision depends on his interest, the time at his disposal, his insight into human behavior, and his skill in psychotherapy He must be aware of his own emotional reaction and above all he must know when he can proceed further without risking the patient's welfare doubt, he should call for a psychiatric consultation With this backing he can decide whether to continue psychotherapy, or refer the patient to a psychiatrist He may find a psychiatric or social worker extremely helpful Often psychiatry or social service can be combined with medical treatment Thus, no arbitrary dividing line can be drawn It happens, however, that a practical line of demarcation might be drawn by means of the case herein described I confined my discussion and interpretations to her attitude toward the treatment, and to her reactions to current or recent life situations I did not use "uncovering" therapy To handle such material requires the insight and training of a psychiatrist, if harm is to be avoided

In summary, obesity of the exogenous type in women may be regarded as a personality disturbance, the physical expression of which is the accumulation of fat The obesity is almost invanably accompanied by abnormal craving for food. which is associated with a variety of nervous The fundamental treatment is psysymptoms Most patients require intensive chotherapy psychotherapy based on a deliberate application of the principles of psychiatry to medical practice. The relationship between emotional factors and eating is shown directly only by means of the spontaneous associations which are made by the patient. The initiative for the conversation remains with the patient, but the direction is supplied by the therapist Attempts to influence the behavior of the patient with respect to eating and other problems are made on the same princi-Psychotherapy inevitably includes the use of interpretations These are either made by the therapist or inferred by the patient tation is a powerful force for good or evil. Its effect, and that of psychotherapy in general, depends on the doctor-patient relationship, which is analogous to the phenomenon of transference in psychiatry The practitioner should not discuss or interpret the deeper motivations unless he has special competence as a psychiatrist. Often psychiatry or social work can be combined advantageously with medical treatment

## ESTIMATE MEN RESPONSIBLE FOR BARREN MARRIAGES IN 30-50 PER CENT OF CASES

It is estimated that between 10 and 15 per cent of adult marriages are barren. In these the man is either a contributory or sole cause in 30 to 50 per cent of the cases, according to two San Francisco doctors writing in the July 12 issue of the Journal of the American Medical Association

Lewis Michelson, M.D., assistant clinical professor of obstetrics and gynecology at the Stanford University School of Medicine, and Robin Michelson, M.D., studied a group of 855 barren marriages of which 519 husbands had impaired fertility

In 287 of the couples the physicians collected adequate data to analyze the relative fertility of husband and wife. They state that "this study offers a challenge to physicians, in that of these 287

couples there were 99, or approximately 34 per cent, in which both husband and wife were apparently fertile, as far as could be determined (in the present state of medical knowledge), and still no pregnancy occurred "

The physicians point out "that either husband or wife may be the sole cause or both may have minor defects, the combination of which is sufficient to prevent conception. Consequently, one must not be satisfied with the finding of defects in one partner, but both husband and wife should be examined completely before an opinion is expressed as to the factors causing the infertility and the possibility of altering them "—American Medical Association News, July 11, 1947

#### A CLINICAL APPROACH TO THE OFFICE MANAGEMENT OF DIABETES MELLITUS

FREDERICK WILLIAMS, M.D., New York City

TTTH modern medicine, through public health measures and recent advancement in therapy, making such astounding advancement in the morbidity and mortality in the diseases of youth and early adult life, the practitioner is becoming more and more a practitioner in geriatrics Ranking seventh among the causes of death is diabetes mellitus The frequency of diabetes is estimated at about one diabetic in every 140 people. This means that in New York State, with a population of about 14 000 000, there are about 100,000 diabetics. It behooves us, therefore, to be sure that every physician who undertakes the treatment of a diabetic is prepared competently to render this service

By "clinical approach" I mean to convey at the outset that I shall make every effort to set forth in this presentation a practical method of office management which will not be complicated by a tremendous amount of detailed laboratory procedures, which usually leads the general practitioner to despair Rather, I shall attempt to present a rational procedure based upon a sound physiology which can be carried out by any careful, conscientious practitioner To accomplish such a procedure I shall divide the problem into three phases (1) physiology, (2) diagnosis and (3) treatment.

#### Physiology

Briefly for all practical clinical purposes it is sufficient to appreciate that

- 1 Carbohydrate utilization is dependent upon
  - (a) Carbohydrate intake digestion to glu cose and its absorption
    - (b) In the presence of adequate insulin activity
      - Storage of glycogen in the liver and extrahepatic tissues
      - (2) Utilization of glucose as a source of energy

Further for practical chaical purposes, it is sufficient to appreciate that

- 2. In the presence of adequate carbohydrate utilisation there is no disturbance of associated fat metabolism.
- In the presence of adequate carbohydrate utilisation and normal fat metabolism, there is no acidosus
- Presented at the 141st Annual Meeting of the Medical Society of the State of New York, Buffalo Section on Medicine, May 9 1947

- In the presence of adequate carbohydrate utilization, normal fat metabolism, and no aci does, there is adequate hydration and a normal electrolyte balance is maintained
- In the presence of adequate carbohydrate utilization, endogenous protein is spared together with more than minimum protein intake clinically assures protein anabolism

For further practical clinical purposes, it is sufficient to appreciate that insulin activity is dependent upon

Production (islet function)

- The action of antagonists to insulin (pitus tary, adrenal, and thyroid)
- The possible destruction of insulin by toxins or ensyme activity

With this outline of the salient features of the physiology in mind, we may proceed to the second phase of the problem.

#### Diagnosis

The confusion associated with the diagnosis, in my opinion, springs from the concept of trying to group all disturbances of carbohydrate metabolism under a single disease entity which we by custom call "diabetes mellitus." If however, we adopt the concept of a disturbance of carbohydrate metabolism, then the first clinical condition with which we are confronted can be placed read ily into our concept of physiology, which we have just briefly reviewed. The question then will not be, "Is this diabetes mellitus?" Rather, it will be "This is a disturbance of carbohydrate metabolum, what disturbance is it and what steps are necessary for its control?" I am fully aware that there must be a differential diagnosis made from renal glycosuria. This is simply confirmed or eliminated by synchronous urinalyses and blood sugar determinations. Very rarely in clinical procedure does one ever see a renal glycosuma show more than 1 per cent of sugar in the urmaly All of the other disturbances of carbohy drate metabolism with hyperglycemia and glycosums with or without cardinal symptoms of what we call diabetes mellitus should be treated, in my opinion, as a "disturbance of carbohydrate meta bolism. ' For all practical clinical purposes, it is not necessary for us to wrangle over the details of the blood sugar curve. The clinician is anx ious to treat the patient and restore his physiol ogy, not to involve him in so many detailed chemical studies as to make him a nervous wreck over a

blood sugar or tolerance curve The diagnosis is made readily in the typical case with all the clinical symptoms and signs, together with a frank ketosis and acidosis Routine urinalyses pick up most of the cases at the time of a surgical complication That analysis, however, should follow a meal or some carbohydrate intake by mouth, for the fasting urine may cause a missed diagnosis Routine analyses for periodic health examinations if also taken after a meal or carbohydrate intake will find more diabetics. I offer a plea to adopt the method of taking an after-breakfast specimen rather than the time-honored convention of a "first specimen in the morning" Routine fasting blood sugars, if done, should be interpreted with a great deal of caution A mild disturbance may at the fasting period in the morning be well within the accepted concept of a normal blood To summarize, then, the clinical diagnosis depends upon the history of symptoms, the presence of glycosuma, and the elevation of the sugar content of the blood The presence of any or all of these symptoms means "a disturbance of carbohydrate metabolism," and, under these conditions, treatment is indicated

### Treatment

For all practical clinical purposes, the treatment of disturbances of carbohydrate metabolism should be directed toward certain objectives. These objectives are

- 1 Elimination of ketosis and acidosis
- 2 The maintenance of fluid and electrolyte balance
- 3 Adequate nourshment of the patient, including adequate carbohydrate utilization, protein supply, total calories, vitamins, and minerals in the diet
- 4 Control of carbohydrate physiology (excrete less than 10 Gm in twenty-four hours)
- 5 Assurance of protein anabolism by (a) adequate carbohydrate utilization, and (b) more than the minimum requirement of protein intake
- 6 Psychologic approach to assure a mentally well-adjusted patient

These objectives are attained by only one method and that is diet or diet together with insulin. There is no mouth medication of value in this disease.

Let us first consider the diet There are two factors to which one must adhere rigidly First, the diet must be fixed By this I mean that the patient must eat the same amounts of carbohydrate, protein, and fat each day The actual form of the food should be varied by substitution but the amounts of carbohydrate, protein, and fat contained therein must be the same each day

if control is to be attained. The second essential factor is that the diet must be adequate. By adequate I mean that it must (1) satisfy the patient in form and volume, (2) it must provide normal energy to permit usual activity, (2) it must provide calories to maintain a normal weight, to reduce if obese, and to gain if underweight, (4) it must provide adequate vitamins and minerals, and it must provide adequate protein. These criteria for adequateness of diet are simply and practically attained clinically by providing a typical American diet.

TOTALS FOR THE DAY		182	96	81

\* C = carbohydrates, P = proteins, F = fat.

Around this regular diabetic diet, which I call "basic," most diets can be built If the volume of the diet is too large, more concentrated vegetables can be substituted If this diet is too small in volume, more 5 per cent vegetables can be substituted for the 10 and 20 per cent vegetables The amounts of carbohydrate, protein, and fat total 180, 100, and 80 Gm, respectively, and a total of 1,840 calories If this caloric intake is too low, the calories can be raised readily by increasing the butter Around such a typical American diet, additional variations can be made to suit the individual patient. In this fashion a diet is provided accurately and, with the cooperation of the patient, the diet can be fixed easily and adequately Some knowledge of food values is necessary, but reference tables are used at first

For all practical clinical purposes the patient is put on such a fixed diet as a trial diet. After a few days to a week, a twenty-four hour urine specimen is collected and the volume measured by the patient. A quantitative sugar determina-

tion is then made upon this specimen in the doc-The volume of the urine in cubic centimeters multiplied by the percentage of sugar gives one the total grams of glucose excreted in the twenty-four hour period. From the diet we know the total sugar intake or the available sugar intake. We have calculated the total sugar output and the subtraction of these two gives us the total utilized by the patient. Repeated follow-up determinations of sugar utilized, weight activity, and symptomatology soon lead us to a children concept of the severity of the carbohydrate disturbance, and insulin indications the patient is able to render his twenty four hour specimen sugar free on such a diet, and maintain his weight and usual activity, he shows no indication for the use of insulin. If the patient excretes more than 10 Gm of sugar and loses weight and you are sure he follows the diet, he requires insulin (If the patient should excrete a great percentage of the available sugar in the diet, and thus the apparent figure of utilization is little or none, but he gains weight obviously. this patient is breaking the diet.)

Briefly, if the objectives of treatment as outlined above are attained by diet alone, insulin ad ministration is not indicated. If the objectives of treatment are not so obtained, then diet together with insulin is indicated. The indications for or against mulin administration are clinically practically dependent upon a careful observation of

the carbohydrate utilization

#### Use of Insulin

The most important factor in insulin administration is the desage. This is determined by estimation of the amount of sugar not utilized or that which is excreted in the twenty four hour specimen Insulin is the only medication used to increase the amount of carbohydrate utilized Using the amount of sugar excreted in grams in twenty four hours as a guide makes for a simple clinical approach to the determination of the dosage. In a broad general way one unit of protracted-acting insulin will provide for the utilization of about 4 or 5 Gm, of excreted sugar in the twenty four hour specimen. For the practical approach it is best to start at about one unit for every 6 Gm. and at subsequent observations increase the dose gradually This precuation will avoid insulin hypoglycemia which is so disturbing to the psychic adjustment of the patient. The vast majority of patients will be found to be brought, by diet together with a single dose of protracted-acting insulin before breakfast, to a state of carbohydrate utilization which attains our objectives of treatment. One must always remember that with globin insulin the time of most frequent hypoglycemia is late afternoon and with protamine sine insulin, the night and early morning. This is to be anticipated if the twentyfour hour urine becomes sugar free or very nearly so. Afternoon or bedtime snacks of fixed amounts are a simple method of avoiding shocks.

In a small percentage of cases adequate carbohydrate utilization may be attained only by the administration of both protamine and shortacting insulin. For the most part, these are cases in which the estimated does determined by the sugar-excreted method exceeds about fifty or sixty units. In these cases the simplest method in my experience has been to use a fixed mixture of two parts regular and one part protamine sinc insulin. The desage of this mixture is deter mined in the same fashion as described above. With these few simple suggestions as a guide for the use of insulin and diet, almost all of the uncomplicated adult diabetics can be assured an adequate utilisation of carbohydrate and in this way attain the objectives of treatment.

#### Summary

A practical clinical method of office management of the adult uncomplicated dilabetic patient is suggested. This method is based upon the principle of observation and determination of the total carbohydrate utilized from a fixed diet adequate in all respects. A simple method of insulin design is also offered based upon the amount of carbohydrate excreted. Protracted-acting insulin or two to one (regular to protamine sine) fixed mixtures are recommended as most convenient and adequate. These broad general principles have proved very satisfactory in attaining our objectives of treatment in my experience with adult diabetic patients.

#### Discussion

Dr Harold F Brown, Buffalo -- Dr Williams paper is important in that it stresses the need for accurate follow-up on patients who have been discharged from the hospital or who could not have the advantages of hospital education. I believe that every patient with diabetes should be considered as a broad medical problem and not as simply one of a chemical abnormality. In training patients to look out for their own diabetes dictary services are necessary as doctors are not trained as dictitians. It would be useful to have the services of dietitians available to all doctors because after all, the patient s diet is still an important part in treatment tor cannot expect success if he tells his patient just to omit sweets from his diet or even to hand out a diet sheet which is to be followed every day by the patient without substitutions.

The diagnosis of diabetes may be extremely difficult, but it is usually simple. The Exton Rose glucose tolerance test appears to be quite satisfactory and requires much less time and effort on the part of the physician and the patient. It is important when a diagnosis is to be made that the patient be on at least 300 Gm. of carohydrate several days before the test It is also necessary that the patient be free from infection and hyperthyroidism at the time the test is carried out

Patients must be given diets which they can stay on and still carry on their work. In using protamine zinc insulin, which is the basic insulin for all treatment, I find it necessary to give four meals a day in order to keep the patients free from reactions and heavy glycosuria. In doing this one must give relatively large amounts of protein, from 80 to 100 Gm a day

It is my belief that there is more to be gained by the carrying out of fractionated qualitative urine sugar tests rather than the quantitative examination of twenty-four hour specimens, as it is well known that diabetics have sugar in their urine at one time of day, whereas they are free of sugar at another That gives one a better idea of how to alter the dosage of insulin

One of the great problems that besets us is the care of the obese diabetic. They have established their eating habits, and it is difficult to alter those. Food is to them like alcohol is to an alcoholic, and it frequently becomes a psychiatric problem. If these patients are given insulin, they increase weight When they increase weight, it is necessary to give more insulin, so that if you are not successful in maintaining a reduced diet all treatment fails.

The determination as to how accurate the control should be must be an individual problem in every case. One strives to keep diabetes under continuous control, but this cannot be done always. We simply do the best that we can with what is at our command under all circumstances.

# SCIENTIFIC EXHIBITS 1948 ANNUAL MEETING

Applications for space for the scientific exhibits should be made directly to Chairman of Subcommittee on Scientific Exhibits of the Convention Committee

Dr J G Fred Hiss 505 State Tower Building Syracuse 2, New York

The Annual Meeting will be held May 17 to 21, 1948, at the Hotel Pennsylvania in New York City

No Applications can be considered after January 15, 1948

There will be two groups of awards

Awards in Group I are made for exhibits of individual investigation, which are judged on the basis of originality and excellence of presentation

Awards in Group II are made for exhibits which do not exemplify purely experimental studies and which are judged on the basis of excellence of presentation and correlation of facts

W P ANDERTON, M.D., Secretary

#### HEALTH SUPERVISION OF THE INFANT AND PRESCHOOL CHILD

EDWARD R SCHLESINGER, M.D., MPH, Albany, New York

(From the Division of Maternal and Child Health, New York State Department of Health)

R COENT major advances in the medical sciences have insured a continuation of the spectacular decline in mortality and scrous illness during infancy and the preschool period which has occurred over the past three decades in the United States. These developments, furthermore, bring a broader objective into view the provision of adequate health supervision for every infant and preschool child.

In a broad sense, health supervision of the in fant and preschool child guides his physical, mental, and social development toward the goal opperimal physical health and a well-adjusted adult personality It consists of four basic elements.

#### Basic Elements in Health Supervision

- 1 Periodic Medical Examinations to disclose the presence of physical defects and deviations from normal physical growth and development. Discovery of the defects and other abnormalities is followed regularly by steps leading to more want diagnosis and to the correction of physical defects and other abnormalities which are amenable to treatment. This implies a knowledge of community resources and a determination to utilize these resources.
- g Immunizations to protect the infant and preschool child against communicable diseases of special hazard to the young child The infant may be protected effectively against diphtheria, amallpox, whooping cough, and tetanus. Protection against these diseases is stimulated by additional small injections before the child's entrance into school.
- 5 Supermoon of the child's nutrition with particular emphasis on providing the necessary supplements of vitamins A, C, and D Breast-feeding is oncouraged unless specifically contraindleated.
- 4. Attention to the psychologic and social aspects of growth and development to prevent the development of behavior difficulties. Parents are prepared in advance for the successive stages of normal development. For example, they should anticipate the decrease in food intake that normally occurs about the time of the infant's first birthday. They should be made aware of the sharply negativistic phase through which a child

normally advances at the age of two and one half years. Understanding guidance rather than coercion during this stage of personality development may prevent later behavior difficulties

#### Responsibility for Health Supervision

Should the responsibility for health supervision of the preschool child fall on the pediatrician or the general practitioner? Although the pediatrician may be best qualified by training for such supervision, the size of the problem makes it clear that the general practitioner must provide the greater part of the care A generally accepted schedule of supervision consists of monthly visits up to nine months of age, trimonthly visits between nine months and two years of age, and semiannual visits thereafter until six years of age. For the estimated 600,000 children under six years of age as of July 1, 1946, in upstate New York (New York State exclusive of New York City), meeting such a schedule would entail more than three million visits annually, or 92 visits per pediatrician each working day for each of the 130 practicing board-qualified pediatricians in upstate New York on that date

The distribution of pediatricians makes it even more difficult for them to cover more than a small part of the necessary preschool health supervision services. Of the 130 pediatricians, 99 reside in seven of the 57 upstate counties. There are no pediatricians located in 32 counties, or 56 per cent of the total. With the added factor of travel involved, it is apparent that pediatric specialist services are spread very thin over large areas of the state.

Responsibility for child health supervision for the greater part of the preachool population, therefore, must fall upon the general practitioner Through the welter of propaganda about infant and child care on the radio and in the press, the average parent still looks for guidance to her own physician. If the private practitioner could discharge this function completely without help there would be no need for an organized program of health supervision under public health auspices. Many factors, several beyond the control of the physician, make it extremely difficult or even impossible for physicians in private practice to devote the needed attention to this phase of preventive medicine.

In areas of greatest need, such as rural areas with high birth rates, physicians are preoccupied with care of the sick patient. Some physicians have only casual interest in the presumably healthy child, largely because so little attention was paid to this subject during his undergraduate medical course and because provision of certain health supervision services requires the assistance of other than medical personnel, as will be shown later.

From the parent's viewpoint, the mother may hesitate to bring her infant or preschool child to an already overburdened physician for routine This may be due to her desire to supervision spare the physician or because of the inconvenience involved in waiting her turn with a fretful child on her hands Many parents of preschool children most in need of this service make no effort to obtain such care, due to their ignorance of the value of health supervision Furthermore, it is generally acknowledged that health supervision by physicians in private practice is one of the earliest services to be eliminated under economic stress For these reasons, and to meet the public need, it is necessary to apply mass technics at least as a supplement to private practice

## Purpose of the Child Health Conference

One such technic is the child health conference. in which groups of children under six years of age may be given health supervision at great economy of time and effort The conference does not displace the private physician even from the field of preventive medical care Experience has shown that the child health conference has enhanced the opportunities of the local physician in that he has referred to him many children for diagnosis and treatment whose difficulties might not otherwise have been brought to medical attention child health conference is not a treatment clinic and it is not set up to take care of sick children Furthermore, acutely ill children are excluded from the conference entirely to prevent spread of infection

This service for preschool children has been accepted since the early 1920's in wide areas of the State—Initially, an itinerant team of physicians and nurses conducted conferences at irregular intervals in scattered localities at the request of the local health officers—In 1925 a dental hygienist was added to the team—As the idea took hold, communities established their own conferences so that the itinerant program was dropped in 1935. The peak was reached in 1940 when 4,400 conferences were held in 240 separate communities. During the course of 1940 approximately 50,000 children were seen—Since that time there has been a marked decrease in the number of confer-

ences held, so that in 1945 only 2,500 conferences were held in 220 communities. This decline was undoubtedly due, in large part, to wartime conditions and the concomitant acute shortage of medical and nursing personnel. A resurgence of interest in child health supervision has occurred in the past year with the return of physicians from the services and the general relief from war-connected activities.

Child health conferences have been supported financially in varying ways. The entire cost may be borne by the local governmental unit or, under the State aid-to-municipality program, the municipality may be reimbursed to the amount of at least 50 per cent of the cost by the State Department of Health Finally, the conference physician's fee may be paid directly by the Department for a limited period of time as a demonstration

During the developmental years of the conferences the policies and services of such conferences have varied from place to place. Participating in the conferences, although almost never at the same time, have been physicians, public health nurses, nutritionists, dental hygienists, lay volunteers, and, very rarely, social workers. Some areas have admitted all children, including those receiving adequate private medical supervision, whereas others have excluded such children. Still other localities have employed a means test.

# Duties of Personnel in the Child Health Conference

To set a goal, it might be well to enumerate the personnel and outline their duties in a well-run conference No conference should be held without a physician and a public health nurse physician takes a short history, examines the child, dictates the results of the examination to a clerk or volunteer worker, and discusses any posttive findings with the parent in order to impress upon her the importance of further care for complete diagnosis and possible treatment physician further advises regarding the feeding of infants and preschool children, including formulas for infants who are not breast-fed, and he emphasizes the importance of supplements of vitamins A, C, and D The public health nurse manages the conference, further interprets the physician's recommendations, and performs the necessary follow-up in the home

Additional personnel may include the nutritionist to give detailed nutrition instruction. In practice, it is preferable for the nutritionist to act as consultant to the public health nurse and to have the nurse include nutrition instruction as an integral part of her educational work at the conference. The dental hygienist does a dental prophylaxis and educates the mother in the necessity

for care of the child's teeth by a dentist A medical social worker is available for consultation with other personnel of the conference, but it is not expected that medical social workers will often be available to attend the conferences themselves. The lay volunteer workers assist in various nonprofessional tasks, such as transportation of parents and children in rural areas and assistance in weighing and measuring the children.

It is essential that all children not under regular medical supervision should be eligible. Previously there has been duplication of effort as children adequately supervised by physicians were brought to the conference by overanxious parents. For the rural and small urban areas no other limitations on eligibility should be imposed.

For various reasons, in many preschool children not under regular health supervision, minor conditions are neglected and early major deviations from the normal are not discovered. The child health conference makes it possible for children with these conditions to be referred to the private physician for care.

# Services Available in the Child Health Conference

The better conference offers certain services not available to the general practitioner, such as dental prophylaxis, as well as other services which the private physician often does not have suffi cient time to develop, for example, detailed in structions in food preparation and education in regard to development of normal behavior patterns. Physicians, therefore, are encouraged to utilize the conference for any specific services they may indicate The only limitation in this regard is that children may be referred for dental prophylaxis only in those areas in which this service cannot be readily obtained from private sources. It should be emphasized that children are referred only for specific preventive services and not for diagnosis or treatment.

To improve the medical services at the child health conferences, charts are being used to record serial observations of weight and height of infants and preschool children Such a graphic presentation may assist the physician to evaluate the child's development. Recently, the Jackson Kelly growth charts have been introduced on an experimental bases in a few child health con ferences 1 These charts appear to be the most effective of those available covering the entire preschool period They are simple to maintain and the simificance of the findings is easily apparent The charts cover three age periods with different forms for each sex. The ones used in child health conferences cover the first year of life and the entire period from birth to six years. If they prove to be valuable, they may be transferred to the school record to serve as a baseline for serial observations during the grade-school years

Inasmuch as one of the primary functions of the child health conferences is that of screening abnormalities, it is proposed that simple laboratory tests be performed. The Phillips hemoglobin test which utilizes standard copper sulfate solutions is an ideal acreening test.2 Only one concentration of copper sulfate solution need be used and a standard solution for readings above or below 11 Gm. of hemoglobin is available from the State Department of Health for use in local child health conferences. All children whose hemoglobin levels are below a reading of 11 Gm are referred to the private physician for further diagnosis and treatment. In no sense is this test diagnostic, since it merely discloses the presence or absence of anemia and not the condition which has produced anemia.

Immunisations are an important part of child health supervision. If the entire State were served adequately by child health conferences, there would be no need for separate immunisation clinics for preschool children Full utilisation should be made of child health conferences to in crease the number of preschool children immunised against diphtheria, whooping cough, small pox, and totanus. Immunisations against these diseases can be completed by the time the infant is seven months old according to the following schedule.

- Immunization against whooping cough at three, four and five months of age
- Vaccination against smallpox at aix months of age
- 3 Immunisation against diphtheria and tetanus with precipitated toxoids at six and seven months of are
- 4 Smaller stimulation doses should be given to preschool children against diphtheria, tetanus, whooping cough, and smallpox at between three and six years of age.

Printed material to assist in the educational aspects of the child health conference is to be made available rapidly. A series of leaflets

<sup>\*</sup> Although the American Academy of Pediatrics recommends immunisations against diphtheria, whooping cough, and tetanus at a slightly older age it must be recalled that the recommendations of the Academy are primarily intended for children are generally in better circumstances and less exposed to the danger of infection. Furthermore recent evidence has indicated that early immunisation against whooping cough is effective. Even though protection against whooping cough may not be so complete when because three months as opposed to air months, and this is still a moot point, a significant level of protection is conferred at the period of life when the disease is most dangerous.

entitled, Food for Baby, has been distributed as an aid in interpreting the recommendations made by the conference physician in regard to infant feeding. Work is proceeding on another series of leaflets on normal growth and development and the minor behavior difficulties of the preschool period. A manual of reference material for use at the child health conferences is being prepared.

### Summary and Conclusions

Health supervision is an essential part of the preschool program whether given under private or public auspices Many communities can provide

this service efficiently through the child health conference. Through the various measures discussed, it is hoped that the child health program may be expanded throughout upstate New York to meet this very evident need.

### NEW SYNTHETIC PLASTIC PROVES ITS VALUE IN BRAIN SURGERY

Experiments on animals indicate that polyethylene, a new synthetic plastic, may fill a long-felt need in surgery

In the September 13 issue of the Journal of the American Medical Association, three members of the neurosurgical service of the Children's Hospital and the Department of Surgery of the Harvard Medical School report a number of experiments in which pure polyethylene in the form of tubing or film was implanted safely into the tissues of cats, dogs, monkeys, and rabbits. This is important because, according to the writers, "up to the present time, no plastic material which can be formed into pliable tubing as a substitute for rubber or into thin film to replace normal membranes in the body has been found"

The authors of the article, Franc D Ingraham, M D, Eben Alexander, Jr, M D, and Donald D Matson, M D, all of Boston, describe polyethylene as a tough thermoplastic resin which does not need the addition of another chemical compound to make it flexible and phable—It is almost transparent, will stretch without breaking easily, is lighter than water, is resistant to most of the common solvents, and its physical properties are not significantly changed by ordinary climatic temperatures or by the range of

body temperature changes Used extensively in the manufacture of airplanes as an electric wire insulator, it has been produced in the United States since 1943

As neurosurgeons the writers were chiefly interested in the reactions produced by this plastic in the central nervous system and its coverings. Two types of experiments were undertaken with animals (1) inserting pure polyethylene directly into the tissue of the cortex of the brain, and (2) cutting out a portion of the dura—the outermost, toughest, and most fibrous of the three membranes that envelop the brain and spinal cord—and replacing it with pure polyethylene film

Tissue reactions were studied in 43 cats, 10 dogs, 9 monkeys, and 3 rabbits "None of the animals showed evidence during life of cerebral irritation or of any unusual behavior that could be attributed to the presence of polyethylene," state the doctors. Examination after death showed that there had actually been no foreign body reaction Further experiments, undertaken because previous studies have shown that certain forms of plastic and rubber tubing cause penicillin to become less effective, indicated that this is not the case when pure polyethylene is used.

### GENERAL DISTRIBUTION OF ANTIMENINGOCOCCUS SERUM DISCONTINUED

The general distribution of antimeningococcus serum, produced by the State Department of Health Division of Laboratories and Research since 1916, has been discontinued. It will be supplied hereafter only by the Central Laboratory, Albany, the Branch Laboratory, New York City, and the supply station in the Department of Health, Buffalo The need for antimeningococcus serum has greatly diminished following the use of sulfonamide drugs and antibiotics

However, even during the current period of low incidence of meningococcal infections, considerable quantities are still being distributed (718 vials in 1946)

Continued demands may necessitate resumption of serum production, suspended in 1945. The change in distribution procedure has been made to conserve the present supply—Health News, October 13, 1947.

### HEAD TRAUMA AND HYPERSENSITIVITY OF THE CAROTID SINUS

ARTHUR D ECKER, M D, and IRVING L. ERSHLER, M D Syracuse New York

(From the Departments of Surgery (Neurosurgery) and Medicine Syracuse University College of Medicine)

FOR many years it has been known that presgrame over the carotid artery may cause slowing of the heart and a drop in arterial blood pressure. Hering was the first of the more recent investigators to show that the carotid sinus is richly supplied with sensory nerve fibers. These afferent fibers emerge from the arterial wall traverse the intercarotid area, and proceed to the brain stem.

In the past twenty years much has been written about the physiologic and clinical implica tions of the normal and of the hypersensitive carotid sinus 4-4 Little attention has been paid to the causes of hypersensitivity of the sinus. Etiologic considerations were summarized by Weiss as follows "In instances in which the carotid sinus nerve or nerve endings are hyper sensitive because of local disturbances (arteriosclerosis, inflammation pressure by tumors and neoplasms), abnormal afferent impulses may arise following normal stimulation. In other instances normal afferent impulses from the sinus may set up abnormal reactions as the result either of changes in the threshold of central synapses (neurosis), or of increased sensitivity of the motor nerve ending or effector organs resulting from disease (coronary sclerosis and thrombosis) combination of these three factors may play a role in individual cases." 1

Throughout the years there have been occasional suggestions that trauma to the neck may cause intense stimulation of the carotid sinus. A review of the literature failed to disclose evidence of close association between trauma of the head and neck and subsequent hypersensitivity of the carotid sinus. However, in the course of preparation of this paper, there appeared the report of one such case In 1945 one of us (A. D L.) reported 4 cases of spasm of the internal carotid artery following such injury 7 In one of these cases, an instance of blunt injury to the head, there were ischemic changes in the wall of the internal carotid artery within the carotid canal. It is possible that in cases of a direct blow to the neck or sudden extension or lateral flexion of the head there may result stretching and spasm of the internal carotid artery in the region of the carotid sinus Such spasm, in turn, may produce hy poxia of the arterial wall and resultant hypersensitivity of the sinus Four cases are herewith

Presented at the 141st Annual Meeting of the Medical Hociety of the State of New York, Buffalo May 8 1037 Section on Neurology and Psychiatry presented in which such a course of events may

#### Case Reports

Case 1 -The patient was a 22-year-old man a college athlete who had previously been well During the first round of a boxing match on Feb 9 1946 the patient received a "head butt ' to the skull just above and behind the left eye He did not lose consciousness and was able to finish the scheduled three-round match, Subsequently he developed syncope and his pulse rate was found to vary between 42 and 48 per minute. Accordingly he was hospitalized at the Student Infirmary Physical examination was entirely negative except for the findings noted above and a left subconjunctival hemorrhage For the first few days he could not assume an erect position because of faintness and giddiness. After a few days he was able gradually to resume moderate activity but his pulse remained Pressure on the left caroud sinus produced asystole for fifteen seconds X ray study of the skull was entirely negative. The spinal fluid was negative in all respects. On Feb. 17 1046 the patient a pulse rate was 44. Twenty five minutes following the administration of 1/100 grain of atropine sulfate the pulse rate was 60. In brief this was a case of hypersensitivity of the left carotid simus following head injury with forced flexion of the head to the right Subsequent studies over a period of several months revealed that the patient s pulse rate was normal and that he was free from symptoms.

Case 2—The patient was a 31 year-old white man. About ten years ago he received a blunt head injury during a football game and was rendered unconscious for several minutes. The clinical findings immediately following the injury are lacking. For the past year he has had recurring opisodes of headaches faintness and giddiness Examination now reveals hypersensi vity of each carotid sinus of the 'corebral type.

Case 3 -The patient was a 17 year-old white man. On Dec 19 1940 while climbing down a ladder the patient fell eleven feet to the ground During the fall he struck the right side of his forehead on the ladder. He was not dazed and did not lose consciousness. Headache persisted and vomiting occurred two days later When seen four months later the patient had complaints of headache and episodes of unsteadiness. Examina tion revealed no abnormality of the nervous system Pressure on the right carotid sinus caused slowing of the heart rate headache and unsteadiness of the same type the patient had experienced when he assumed the erect position. Pressure on the left carotid sinus caused neither change in heart rate nor subjective disturbances This was, therefore a case of hypersensitivity of the right caretid sinus

following a blunt trauma to the right frontal region Case 4 -- The patient was a 41-year-old white man with the chief complaint of frequent episodes of vertigo On Feb 20, 1939, he was struck on the right frontoparietal region by a falling metal drum which weighed 27 pounds He immediately lost consciousness for several seconds remaining at home for three days, he returned to work but complained of episodes of lightheadedness Thereafter, he noticed that when he moved his head suddenly up or down he would have a sensation of whirling and occasionally some nausea tion ten months after the injury revealed that pressure over the left carotid sinus with the patient in the erect position resulted in prompt loss of consciousness, a few clonic movements in all four extremities, and a precipitous drop in blood pressure Repetition of carotid sinus pressure after recovery produced the same clinical picture and also slight On assuming the supine position recovery was prompt and complete Pressure over the right carotid sinus for forty-five seconds was marked only by transient faintness and a very slight rise in pulse rate (from 90 to 100) The blood pressure remained constant at 128/65 In brief, this was a case of hypersensitivity of the left carotid sinus which began immediately following a blunt head injury

### Discussion

Data on 4 cases have been presented, in each of which hypersensitivity of the carotid sinus followed blunt injury to the head The patients were all white men and were 22, 31, 17, and 41 years of age, respectively There was no evidence of arteriosclerosis or of psychoneurosis in any case. In 3 of the cases the symptoms began immediately after the trauma, whereas in 1 case the symptoms did not begin until nine years after the trauma

One of the most common causes of arter spasm is traction on the vessel One of us demonstrated ischemic changes in the wall of internal carotid artery following violent late flerion of the head to the opposite side 7 Me described a case of severe head trauma will much traction on the carotid artery that tea of the intima and thrombosis resulted 8

These cases are presented to call attention the possibility that head trauma may be a ca factor in the production of hypersensitivity the carotid sinus It is hoped that there will further investigation of this subject

### Summary

Four cases are presented in which hypers tivity of the carotid sinus followed a blunt in to the head In 3 of the cases the carotid sy toms appeared immediately after the train In the production of the head injury there have been enough extension or lateral inclina of the neck to exert traction on the carotic tery Such traction may have caused tempo spasm and hypovia of the arterial wall in region of the carotid sinus and resultant pe nent hypersensitivity of the sinus

# ROCKEFELLER FOUNDATION GRANTS \$31,500 TO CONTINUE TWIN STUDY

The Rockefeller Foundation has made a second appropriation to enable the department of medical genetics of the New York State Psychiatric Institute, New York City, to continue its twin study on the problems of aging for another three-year period beginning February 1, 1948 This second grant is \$7,500 more than the first appropriation of \$24,000 made nearly three years ago

In announcing these developments, Dr Nolan D C Lewis, director of the Psychiatric Institute, reported that very satisfactory progress is being made in this state-wide twin research project on the con-stitutional problems of aging and longevity as organized by Dr F J Kallmann and his staff of assistants

Due to the cooperation of the general public,

the medical profession, and many hos administrations and welfare agencies, the number of twins over 60 years of age available study approximates 1,500 ranging up to 94 years. Of this number about 950 twins are still the majority of them living in their communit part of the general population without requ institutionalization or old age assistance

The potential merits of these long-range st on human personality are reflected in the magn of the grant from the executive committee o Rockefeller Foundation This grant will ma possible to continue the observation of this un sample of senescent twins until most of them, completed their life span -Mental Hygiene September, 1947

# ; ARKINSONISM—IS IT A SURGICAL PROBLEM?

EFFERSON BROWDER, M D, Brooklyn, New York

Trom the Surgical Department of the Long Island College of Medicine and the Neurosurgical Services of the Viscoklyn and Kings County hospitals)

E The EDICINAL and physical thempeutic measures for the alleviation of tremor and langidity of Parkinson's disease have resulted in ≠moderate, but usually transitory, improvement in Tsome patients In others, little benefit has been derived from these therapies. Failure to effect a cessation of the tremore, in particular, by these so-called conservative means has stimulated sur geons to explore the possibility of favorably modi lying this distressing symptom by operation That this is not strictly a modern endeavor is attested to by the reports of Horsley, 1890, 1909,1 Anschuetz, 1910,2 Payr, 1921,2 Nazaroff, 1927 Polenow, 1929, etc., concerning the surgical treatment of a somewhat comparable dyskinesia, namely choreoathetosis It may be said, however, that for the most part our present-day con cepts regarding the surgical treatment of parkinsonism have been derived from the observations of Bucy, 6-8 Putnam, 9-11 and Meyers 12-14 In 1940 Klemme very briefly reported his surgical experiences with 100 cases of parkinsonism.18 Up to the present time, Klemme's writings have not clarified thoroughly the extent of his surgical procedure, nor do they present a concrete picture as to the end results

From the reports available in the literature and my own observations it seems reasonably well established that the tremor as well as the rigidity of the disease under consideration may be modi fied by (a) excision of a part of the premotor cor tex, (b) undercutting of the premotor area, (c) division of the anterior limb of the internal capsule, (d) section of the pallidofugal fibers, or (e) interruption of the lateral pyramidal tract at the second cervical segmental level. Whether or not any of these surgical procedures result in sufficient symptomatic improvement to justify their employment has been questioned by many truth, even neurologic surgeons frequently have raised just this issue and, it seems to me, rightly Therefore, it becomes necessary that those actively interested in surgical therapy for parkinsonism must report their results with a more objective attitude lest this therapy fall into disrepute.

Certainly one should not consider, except in the most unusual circumstances paralyzing a limb in order to deprive it of a tremor. Nor should one

subject a patient to a major surgical procedure without reasonable possibility of rehabilitation. Furthermore, the operation proposed should be one that can be executed successfully by anyone familiar with cerebral surgery

I have had the opportunity to observe 33 pa tients with parkinsonism upon whom either a spinal or cerebral operation had been performed Four of these had had a part of the premotor cor tex removed by Klemme, 4 had a section of the lateral pyramidal tract carried out by Putnam, 12 had been operated upon by Meyers while he was associated with me, using a variety of procedures that is, undercutting of the premotor cortex and removal of a part of the caudate head in 2 cases extirpation of the head of the caudate nucleus and section of the oral half of the anterior limb of the internal capsule, 4 cases, extirpation of the head of the caudate nucleus and oral thirds of the puta men and globus pallidus and interruption of the fibers running in the oral fourth of the anterior limb of the internal capsule, I case and section of the pallidofugal fibers 5 cases

The remaining 13 patients were operated upon by me. In each of these 13, the dorsal half of the head of the caudate nucleus was first removed and the fibers of the anterior limb of the internal capsule sectioned up to a few millimeters of the genu. Only unilateral operations were performed in this group

Although this series of 33 cases is admittedly relatively small and it seems probable that the 4 of Klemme s and 4 of Putnam s therein included may not represent a fair sample of all that they have treated surgically, yet the results as I have observed them will be reviewed briefly but pointedly Of the 4 operated upon by Klemme 3 had bilateral tremor and ngidity prior to opera Following a unilateral operation in each there resulted a marked spastic hemiparesis with out rhythmical tremor in 2 cases and, in the third a spastic hemiparesis with occasional outbursts of irregular tremor on the paretic side. The remaining patient had what may be termed uni lateral parkinsonism He was rehabilitated completely at the time I saw him, eighteen months after operation

One of the patients operated upon by Putnam presented a most interesting result. Seemingly there had been marked rightly with minimal tremor bilaterally before operation. Two years after operation there was marked reduction in

Presented at the 141 t Annual Meeting of the Medical Society of the State of New York, Buffalo Section on Neurology and Psychiatry May 8, 1947

rigidity of the extremities on the side homolateral to the operation with an occasional transitory tremor in the upper extremity which had an amplitude far greater than the relatively fine tremor of the unoperated side Although this patient had not been rehabilitated by the cordotomy, the rigidity of the extremities on the side of the cervical operation had certainly been reduced markedly The results in the other 3 patients of Putnam were not good, in fact, they should be considered total failures In the series of 12 patients reported by Meyers, operated upon on my service, a variety

of operative measures were tried The first operation was performed in March, 1939, at which time the premotor cortex of a young woman was undercut without apparent alteration in the rigidity and tremor limited to the extremities of the left side Following this. at the same operation, a part of the head of the caudate nucleus was removed There was complete cessation of the tremor and favorable modification of the rigidity for three and a half years The tremor returned in the latter part of 1942 and persisted unchanged until last seen in 1946 the remaining 11 patients, 6 were somewhat improved by the procedure or combination of procedures employed A review of all the clinical and operative features of these 6 leaves me with the conviction that it was damage to the fibers of the anterior limb of the internal capsule that produced the modification of the tremor rather than the direct attack on the basal gangha the remaining 5 patients had an enduring marked hemiparesis and recurring convulsions One subjected to section of the pallidofugal fibers was improved markedly as regards tremor and rigidity but as a by-effect of the operation there was diabetes insipidus and impaired control of the vesicular sphincters Three of the 12 died from complications arising from the operation It may be concluded that section of the pallidofugal fibers (carried out in five instances) is attended with too many by-effects for the procedure to be offered as an operation of choice in the surgical treatment of parkinsonism As stated, it appears highly probable that removal of parts of the basal

ganglia has no direct effect on tremor or rigidity Subsequent to Meyers induction into the Army it was decided to pursue what seemed to me the most fruitful course, namely, interruption of the fibers of the anterior limb of the internal capsule It seems appropriate at this point to outline some of the technical features of the procedure as now carried out

### Procedure

The operation should be conducted under novocain infiltration without preoperative medication The subject is placed on the table in a supine postion and the drapes so arranged as to give a clear view of the extremities contralateral to the mode of the brain to be surgically exposed tremities should not be restrained or otherwise encumbered, especially the upper one A small box flap is outlined and turned down in the frontal region, fashioned to expose the falx and the upper frontal area. After reflecting the dura and gaining proper orientation, a 25- to 3-cm incision is made in the cortex anterior to the premotor area and 3 cm from the falx which it parallels The incision is carried into the most anterior aspect of the lateral ventricle, thus exposing the head of the caudate The upper half of this structure is removed either by suction or scoop, thereby exposing the inner fibers of the anterior limb of the internal The most anterior of these fibers curve in capsule rainbow fashion from forward aft to enter the cap-Using a blunt right-angle hook, the arm of the hook being 0.8 cm in length, section is begun at the rostral end of the capsule It is best to section about 1 to 2 mm of the capsular fibers at a time, then wait two to three minutes During this rest period the surgeon himself makes observations regarding the amplitude of the tremor of the contra lateral hand and the grip power is recorded Slowly, bit by bit, from forward toward the knee of the capsule the fibers are sectioned and observations as sug gested are made and recorded As a point approx mately 1 cm anterior to the knee of the capsule 18 approached, the patient not infrequently becomes difficult to arouse and only after rough prodding is he capable of cooperating After five to ten minutes this drowsy state passes and the tremor which usually abates during the drowsy period once again Further sectioning of the capsular becomes active fibers, up to a point approximately 07 to 08 cm. from the knee, completely abolishes the tremor This is not the end point of the operation. If further sectioning is not carried out the tremor usually returns within a few weeks after operation. It, therefore, is important to carry the sectioning further and the operation is completed only after the production of a marked paresis of the hand. In other words, the patient is just able to elevate the upper extremity from his side and is capable of only slight flexion of the fingers without being able

hemostasis, the wound is closed in the usual manner with layer silk Immediately after operation the extremities affected by the procedure are paretic and relatively flaccid, Babinski's sign and the so-called confirma-The abdominal reflexes are tories are present abolished on the involved side The patient usually is drowsy but easily aroused and cooperative. On the day following operation the hemiparesis often is more severe, gross movements of the paretic part, however, being preserved There is a tendency for the patient to "sleep" if left undisturbed Foods and fluids are taken readily Excessive sweat-

to grip the observer's hand Examination of the

lower extremity at this time will show that this

part is about as paretic as the upper

sign is easily demonstrable

Babınski's

Following complete

hing may be evident and this bilaterally A mild splegree of fever persists for a few days, but hyper clubernic states have not been observed. Occa whomally, there is a transitory period of an infantile grappe of micturition as sometimes is seen in other stypes of frontal lobe damage. Gradually, the motor appower returns and by the tenth to twolfth post-ciperative day when the patient is allowed out of bed, are mild to moderate hemiparesis is demonstrable splently and to moderate hemiparesis is demonstrable splently to perform skilled acts with the splently had been a forced to grapping been observed. A slight but evident hemic paresis persists in most subjects but this is not sufficient to cause inconvenience or clumsiness in the swe of the affected hand

#### Results

Albecember 1 1047

During the past five years, 13 patients with parkinsonism have been subjected to this procedure An attempt has been made to standardize the operation. Eight of these 18 patients had what had been termed unilateral tremor and rigidity however in each instance there were findings indicative of slight involvement of the extremities of the "nor mal" side The results following operation were considered good in 6 of these 8 patients. The tremor was abolished, and rigidity was reduced markedly without more than minimal evidence of dyspraxia. In fact about four to six weeks after operation the hand was used with greater facility than in the presonce of tremor and rigidity before operation. In each of the 6 patients Babinski's sign could be demonstrated on the affected side postoperatively and under emotional stress there was in some, transitory rhythmical tremor of the upper extremity The mask-like facies in each was considerably improved in that there was more animation during speech. In most instances the speech remained slow and monotonous The gait in 4 of those 8 was considered normal, whereas in the other 2 there was slight spasticity associated with a mild limp In addition two of these 6 patients had oculogyric crises which were abolished by the operation. Two others in the series of 18 were considered im proved. They were free from tremor at long intervals but the rigidity component had not been appreciably altered by the operation.

The remaining 5 patients had obvious bilateral parkinsonism of many year's standing. In 3 of these the disease was manifested by marked rigidity and minimal tremor All 3 died as a result of a unflateral operation, one on the fourth one on the eighth, and the third on the eleventh postoperative The findings at autopsy in 2 of these failed to disclose an 'obvious cause for the fatal outcome The remaining 2 with bilateral features of the discase were submitted to unilateral operations. Tremer was abelished and rigidity was favorably influenced in each case however it is questionable whether cossation of tremor and modification of rigidity in the extremities of one side have benefited the situation as a whole. Up to the present time I have not carried out section of the capsular fibers bilaterally Theoretically bilateral operations of this magnitude should not be performed. Future experiences may prove this idea incorrect

For some as yet unexplained reason, patients with rendity as the outstanding manifestation of parkinsonism tolerate poorly the unilateral operation of capsular fiber section. Our experience with this particular group has caused us to exclude them temporarily as possible candidates for operation In fact, satisfactory results have been attained only in patients with gross rhythmical tremors of the one side. Operation may be per formed on the dominant hemisphere, however, speech will be impaired somewhat for four to six weeks after operation The removal of the upper half of the head of the caudate nucleus for the exposure of the capsular fibers does not alter either tremor or rigidity. Moreover, this plus the removal of the oral third of the putamen in one in stance produced no demonstrable changes.

Recurring convulsive seisures may follow any operation that anatomically alters the cerebral cortex. The transventricular operations herein described are no exception to this generalization Eight of the 25 patients upon whom a transven tricular operation was performed had one or more convulsions during the postoperative course. Only 2 continued to have recurrent fits after leaving the hospital and one of these has had only four such attacks in a three-year period

Fortunately many patients with tremor and rigidity of parkinsonism accept their disabilities and earry on their way of life in a productive and otherwise creditable manner. They should be encouraged to continue their activities and are not to be imbured with the notion that all their symptoms can be corrected by a surgical procedure. Some so afflicted refuse to accept any part of their handleap, discontinue all social and gainful activities and eventually scarcely can be persuaded to leave their own room. Such abnormal psychologic reactions may become a major feature of the disease and therefore must be evaluated accordingly.

Another group of considerable proportion having this disease seek relief at an age which in itself makes any elective surgical procedure inadvasable. The physiologic age of 50 arbitrarily has been set by me as the upper limit, however, many at 40 years of age with advanced parkinsonism should not be subjected to operation. If the physiologic age of 50 is adhered to strictly as the upper limit of operability then most instances of parkinsonism due to primary arterial disease will be excluded. All of the 25 patients in this sense operated upon by Meyers or myself were under 45 years of age.

Statements have appeared in the literature that leave the reader with the impression that parkins somem may be cured by surgical therapy. Certainly this is far from the fact. To me, improvement following operation is nothing more than

town called "aggression" is produced, and the amount produced depends upon the degree to which the need for defense is felt. Infants and children are particularly vulnerable, considerable immunity can be acquired, but prevention will always have more possibilities than cure.

We are at present attempting to prevent pandemics of war by group means We know that they will recur while the causes remain un-Perhaps we can gain much by individual case study, we have noted that as men become more free the tendency to aggression is Perhaps medicine is better equipped to deal with the problem than any other group cine is already world-wide in its scope, and has impressive victories in overcoming scored scourges that once devastated the world nox came under control because Edward Jenner as a country practitioner applied the results of his observations to one patient

For effective psychotherapy, as for any treatment, the foundation must be accurate understanding of the condition being dealt with most potent diagnostic means physicians have in psychiatry—perhaps in medicine, too—is a well-taken history To obtain this, we need to win the confidence of the patient, we need to listen and encourage spontaneous telling of the patient's story, and when questioning is needed, we need to know what to seek and how to interrogate This takes time, but it is time well invested time is not spent in careful investigation so that early treatment can be instituted, it will be wasted in ineffective and unsatisfactory contacts Many neurotic patients give a history of treatment by one doctor after another-sedatives, vitamins, endocrine products, physiotherapy, and reassurance have been given—but a psychoneurosis is a condition in which physical or nervous symptoms are an indirect expression of some difficulty of personal adjustment Careful study should disclose that difficulty and treat the source of symptoms instead of the symptoms The physician should make a carethemselves ful and thorough investigation of the man who is sick as well as the sickness the man has, and then try to help him work out his personal problems and conflicts

Direct observation and questioning give us a picture of our patient as he is. Our purpose in taking a history is to develop a dynamic understanding of his life so we understand the personal evolution by which the present condition was reached. If we do not have this knowledge, we are like the person who comes to a movie halfway through and sees two men fighting. He knows they are fighting, but has no idea what the fighting is about

There are three main parts to a psychiatric his-

The first is the patient's account, as much torv as possible given spontaneously, of his difficulty We can learn as much from how he says it as from By allowing time for free expreswhat he says sion before questioning, we learn much of the values the patient places on different parts of his Such an initial interview should not be storv hurried-forty-five minutes or an hour-with the doctor's chief effort directed to using his ears and not his tongue The second part consists of rebuilding the personal atmosphere in which early and later development of personality took place The influence of parents and home conditions is The family physician has the advery strong vantage of knowing some of the background al-We are often far too cursory in our inready quiry into family history In one case referred to me, the family history was listed as "negative," the father having died of peritonitis at the age of 49, ten years previously More careful question ing revealed that the peritonitis resulted from a gunshot wound inflicted by police in a gun battle when the father was staging a hold-up, and the patient had witnessed this in the village street. A family history is not a recital of "Father-55a & w, Mother-d 54 diabetes" It is the determination of the experiences the patient had in relation to those who helped-or sometimes did not help-his start in life, and his subsequent dealings with them In a recent consultation where surgeons had recognized a neurotic basis for complaints of a patient referred in for abdominal operation, the family history was listed as "negative" The patient's parents had separated before she was born, her mother refused to take care of her, she was placed in a foster home, and her foster-father committed suicide when she was This simply reminds us of the old medical "There is more missed by not looking saying than by not knowing "

The third part of a psychiatric history is per Knowing the general background and the people of most importance in it, a systematic account of the patient's life can be obtained are some things patients will tell readily, some they will tell after confidence has overcome reluctance to divulge intimate matters, and some which will come to the patient's consciousness dur-If we do not listen, ing the process of treatment we will not hear any of these If we are not trustworthy and tactful, we will not hear the second If we are not patient and understanding, we will not hear the third Yet the deeper maternal is the most valuable, diagnostically and therapeutically

What has just been said about the doctor's attitude determining the extent to which the patient reveals inner difficulties brings us to the point that psychotherapy has already begun when we start investigation. It is not therapy as we construe it pharmacologically or surgically, it is not done with needles or lights or massage. The physician himself by his own interest, maturity, and understanding is the therapeutic agent. For psychotherapy is personal influence therapy. It is simply the development in a more comprehending way of the doctor's old function in helping his patients through their personal difficulties. What the patient needs and seeks is a wise friend and counselor, one who will respect confidences, not embarrass or laugh at him, one who will help him find a way out of a maze of difficulties and teach him how to avoid getting into such trouble again.

Psychotherapy of the psychoses and severe psychoneuroses is a matter for those with specialist training, as major surgery belongs to the surgeon. There is a great deal of what we might call minor psychotherapy which can best be done by the family doctor. When investigation has indicated that trouble is not too deeply seated, he can proceed with confidence to help the patient to help himself.

Weir Mitchell once and that the most important prescription a doctor ever gives is advice. This is a form of psychotherapy, and since the physician has prestige and is trusted, his prescription is likely to be taken. Advice, however, is a very potent medication, and unsound advice can have decidedly harmful effects. It should never be given lightly, and always the probable effects of the advice it taken should be fully worked out. The best form of advice is that in which the patient works out with the help of the doctor his own idea of what is wisest for him to do Our function is that of a catalyst, not a reagent.

It is not possible in this short presentation to discuss the many ways in which the physician finds himself called upon to give advice. He will be consulted about health and personal relations, marriage, sex, and many other matters, some are quite remote from the medical field and need to be referred to others. But very often behind a seemingly physical complaint there is a desire to be able to talk with the doctor about something personal.

For example a 20-year-old girl went to her doctor frequently for six months and then when her turn came coughed and asked for cough medicine. Finally, she went to another doctor and told him the cough was just embarrassment, she had made an attempt to get away from a quarreling home atmosphere by means of an immature love affair, had an abortion which intendied her personal conflict and the resented attitude of her family to her, and she felt her doctor was the one to go to. When she went, she felt he would not understand because he did not listen to her

In directing our attention to early recognition

and prevention we logically must pay great attention to infancy and childhood. Already there is a great deal being done by general practitioners and pediatricians in child guidance. After reassuring ourselves that a child's symptoms are not primarily organic, we are now looking for some form of reaction to those who are entrusted with his care. Children grow better in a happy home than in a quarreling one, we need to help in the resolution of marital difficulties. Well-inten tuoned parents often are very ignorant of child development and how to guide children in their growth, we need to blend this information with the physical care in which we instruct parents There is no need to catalogue the many ways in which this type of help is sought or given, but it is important to recognize that this represents a most significant contribution to the prevention of later maladjustment.

Psychoneuroses are substitutive reactions, the physical or nervous symptoms are "stand-ins" for some difficulty in adjustment. The patient comes with stomach-ache or insomms or heart pounding or unreasonable anxiety about health, logically he comes to his doctor and the latter in vestigates his physical condition. Differential diagnosis must be made between similar symptoms of dissimilar origin, as, for example, between vomiting as an expression of appendicutis and an expression of disgust.

Disproportion between complaint and organic findings may suggest neurosis, but diagnosis by exclusion alone is not enough. The patient does not want to know what is not wrong he wants to know what is. We have already discussed the value of history-taking in ascertaining what the adjustment problem is. Psychologic tests are giving us laboratory procedures of growing value in diagnosis, prognosis, and treatment. New in sight into the deeper function of personality has been gained through hypnesis, narcosynthesis, and psychoanalysis. The two former are being discussed in the next paper

Physical investigation should not be curtailed because neurotic difficulties exist. One patient who was referred to the psychiatric clinic with digestive complaints had not been x rayed because of the neurosis, he had a duodonal ulcer. Soven years before he had tried to "help" a girl who was pregnant (though he had nothing to do with her being so). He had taken her to an abortionist, and the girl died twelve days later. For two years he went round inwardly accusing himself of murder, and then his digestive symptoms had appeared. Obviously only a psychosomatic approach can cope effectively with such a case.

We often find neurotic patients in situational difficulty, but outer troubles of themselves do not produce neurosis. I am often in situational difficulty on the golf course, and if you put my ball back on the fairway for me I will soon be in trouble again The expert can get out of trouble much better than I can, but he does not often get into the predicaments I do So with our neurotic Their difficulties are there, but somepatients thing within themselves helped get them there, and if we simply remove them from their home or marriage or job we accomplish virtually nothing, we need to help them learn how to play the game of life better, to keep on its fairways, and if they do get in its rough or its bunkers to extricate themselves quickly

The terrific situational stresses of war led to neurotic reactions in many who were well enough organized to have gone through civilian stresses in comfort Less acutely in civilian practice we see "situational neuroses" If the physician detects these as substitutive reactions he can obtain results quickly He should detect the anxiety behind the patient's complaints and seek to determine its source. In contrast to "situational neuroses," but chiefly in matter of degree, are those in which insecurity of relation to others is longstanding, and robust personality organization did not take place to any workable extent in There treatment is likely to be a earlier life long-range process and is generally a matter for the psychiatrist

The medical profession cannot ignore the disastrous results of missed diagnoses and mappropriate treatment of psychiatric disorders need to recognize the chronic invalidism that the unresolved psychoneurosis represents, and to note the frequency with which operations, heavy sedation, irrelevant medication, and superficially conceived advice have complicated the difficulty while the basic process has continued unchecked We must recognize the serious fallacy of the statement, "There's nothing wrong with you" or "It's all your imagination" Several years ago a depressed business man went to his doctor and was told after a physical examination there was nothing wrong with him-to go away and forget He went away and shot himself patient is within half an hour of threatened death from hemorrhage or shock we do not take it We need to develop an equally sensitive diagnostic conscience for psychiatric disturbances as we have for organic, and to study our errors in diagnosis and treatment carefully so that sımılar mıstakes do not recur

These are but a few aspects of a subject of great clinical and practical importance The need for psychiatric service to the community is great and urgent, the small number of specialists we have is grossly unequal to the demand We must train medical students during their course, we must develop psychiatric services in general hospitals where interchange of knowledge between internist and psychiatrist can take place readily, we must make postgraduate instruction available for those who recognize the need but have not had the basic training

Medicine has tackled some formidable problems before and come out the winner triumphs over smallpox, typhoid, and diphthena should give us confidence that we can meet this challenge and win again As we reduce and finally prevent the tragedies that we call mental and nervous diseases, we will be equaling and perhaps exceeding any of the greatest victories man has yet achieved in his long struggle with the ills that beset his kind

## 'I HAVE LOST A FRIEND"

Last week a man stepped out of this world to explore the multiverse and that adventure along the trail where the immortal souls of men travel

In this life, he was unveeringly honest and frank with himself Being of this sort, he was without pretense and the counterfeits characteristic of so many of those who live by expedients and strate-Yes, we shall miss his friendship

time of parting, we pause and think.

How far we of the medical profession could go in meeting the challenges which confront us in this era of social unrest if each one would so order his ways of life that at the time of demise all who have received care at our hands would say, "I have lost a friend"

Have we modern doctors in the zeal for better methods lost the human touch of friendship for those we serve? Meeting the financial obligations incident to medical care is often as much of a problem to the patient as recovery of health itself. If we turn an intellectual "blind spot" upon this phase of the patient's life, we may be fulfilling our duty as doctors, but we fall short of being "a freed". friend.'

The whole modern world needs something more friendship perhaps We're sure a little friendship added to the science of medicine would give it that soul and public good will which it had in the days of our horse-and-buggy grandfathers -United

Medical Service Bulletin, October, 1947

## HYPERTHYROIDISM ITS DIAGNOSIS AND MEDICAL OR SURGICAL TREATMENT

JOHN C McClintock M D and William G Armstrong, M D, Albany New York

(From the Department of Surgery Albany Medical College and the Surgical Service of the Albany Hospital)

NOW that antithyroid substances are avail able for the medical treatment of certain able for the medical treatment of certain thyroid gland diseases,12 it is more important than ever before to diagnose true hyperthyroidism accurately and to differentiate it from conditions that may simulate it. Medical treatment of disorders of the thyroid gland is not applicable in all cases, and, therefore, has not replaced and cannot replace surgical therapy completely Sound judgment must be exercised in selecting the proper form of treatment for each patient who suffers from hyperthyroidism, but before this is possible it is of even greater importance to differen tiate this disease from symptom-complexes, the clinical manifestations of which simulate thyrotoxicons.

Mild neuroses are more frequently confused with hyperthyroidism than any other group of clinical disorders, and since patients who suffer from these conditions may also have slight colloid hypertrophy of the thyroid gland it becomes imperative to differentiate these neurotic states from true hyperthyroidism in order to prevent needless operative or medical treatment.

It is common practice to rely upon the determination of the metabolic rate to establish a diag nosis of thyrotoxicosis. Unfortunately, this test has so many sources of error that, more often than not, it is musleading, and it is our belief that many more accurate diagnoses would be made without the confusing result of this unreliable The determination of blood cholesterol and of blood iodine is also subject to many errors and these tests cannot be relied upon completely There is no laboratory test or group of laboratory tests capable of establishing a diagnosis of hyperthyroidism. As far as we know the most reliable means of making an accurate diagnosis is the correct interpretation of a detailed history and a carefully made physical examination.

To understand the variations in the history that are of differential diagnostic importance the examiner should remember that hyperthyroidism is a metabolic discose that produces organic changes twenty four hours each day. It is a discose characterized by remissions, but these do not occur in a matter of hours or days, as do variations in the neuroscs. Unless the history indicates that heightened metabolism has truly affected the various body functions the diagnosis of hyperthyroidism should be kept in reserve.

Of importance diagnostically is the relation ship of food lutake to weight change While it is true that young patients with severe hyperthy rodism can eat enough food to cause a gain in weight, this excessive intake is apparent from a history of frequent feedings of large quantities of food On the other hand a poor or average appetite and a weight variation of only a few pounds is strongly against the presence of hyperthyroidism

Increase in the body's metabolism causes the production of heat that must be disripated to maintain normal body temperature. Dilutation of the subcutaneous capillaries results and is apparent in the flushed, warm skin of these patients who cannot tolerate much external heat. Generalized hyperhidrosis is also associated with heat intolerance. When the history indicates that only axillary perspiration is present and especially when associated with elammy cold hands, the diagnosis of hyperthyrodism is in doubt. The answer to the question, "Do your hands feel warm or cold to you?" gives the most valuable single clue to the diagnosis.

Tachycardia is common in hyperthyroidism. It tends to be constant and continuous. If it is mermittent this finding is opposed to the diag nosis of overactivity of the thyroid gland. Consciousness of one sown heart action varies in individuals but if there are days in which the patient notes no tachycardia it is evidence against the presence of hyperthyroidism.

Because of the extreme metabolic drive of the disease the patient with hyperthyroidism tires quickly. She begins the day full of enthusiasm and good intentions but soon must give in to physical limitations. In contrast to this is the patient who suffers from nervousness not due to thyrotoxicosis who arises thred in the morning but who frequently improves during the day and actually feels better toward evening.

The onset of noticeable variation in such symptoms as nervousness, irritability emotional instability menstrual flow, dyspinea, and gastrointestinal complaints is of importance when present. They are less reliable as aids in the differential diagnosis because of their greater variability even in patients with hyperthyroidism.

On physical examination palpation of the thy rold gland gives the most important information. The thyroid gland of hyperthyroidism is so firm that it is sharply demarcated. It may be small but the solidarity of hyperplasia is so characteristic that with but little practice it is readily recognized. When this typical, clear-cut firmness is associated with thrill and bruit over the superior thyroid arteries, the diagnosis of hyperplasia and overactivity is established. If, on the other hand, even though it is slightly enlarged, the gland is soft and elastic, this finding is contrary to the diagnosis of hyperthyroidism.

The characteristic elevation in pulse pressure, the sharp precordial slap of the heart overworking from thyrotoxicosis, the palpable muscle tremor, and all of the eye signs are useful, if they are pres-The absence of these signs early in the course of the disease is not incompatible with a diagnosis of hyperthyroidism if other reliable evidence is positive If, however, the diagnosis is in doubt, it is reasonable to prescribe a mild sedative and then to observe the patient over a period of several weeks during which hyperthyroidism will become more apparent, while disease of nervous instability will vary but slightly or may actually Such a period of observation is not disadvantageous for the patient at such an early stage of the disease as long as the observation interval does not exceed one month peutic use of rodine, given as Lugol's solution, may be justified in carefully selected cases, but it is better to withhold iodine until the diagnosis is established and the treatment outlined

When a diagnosis of hyperthyroidism is finally established the choice of medical or surgical management must be made The authors recognize that there is an increasing trend toward the use of medical therapy, but they urge that the needs of each patient be evaluated carefully before the method of treatment is decided upon Winkle and his associates feel that antithyroid drugs are contraindicated in the treatment of simple or adolescent goiter 5 Cole feels that these drugs are madvisable in the treatment of so-called thyroid crisis 1 There is evidence to indicate that the purely medical treatment of large, toxic, diffuse goiters will not be successful If the gorter is nodular another element must be considered, namely, that of possible malignant change We believe that all nodular goiters should be removed surgically as a prophylactic measure against the development of such change 5

The addition of antithyroid substances has enabled more prolonged, and, therefore more adequate, preparation of the patient for surgical removal of a portion of the thyroid gland with a resulting mortality rate from thyroidectomy which is caused solely by uncontrollable vascular accidents. We do not subscribe to the overenthusiastic claims that thiournal and its derivatives will replace operative intervention in the treatment of all forms of hyperthyroidism. It becomes self-

evident that these drugs cannot replace subtotal thyroidectomy when their site and mode of action is understood, for it now seems established that thiouracil acts on the thyroid epithelium to prevent the synthesis of the thyroid hormone. The most widely accepted theory of the caus of exophthalmic goiter is that the thyroid glan responds to some stimulus which arises outside this organ. It must follow that neither the medical nor the surgical treatment of the disease attacks the real cause of the glandular overactivity and, therefore, failures of both methods of treatment are inevitable.

Thyroidectomy, performed by men of experence today, results in 90 to 95 per cent permaner remissions of the symptoms of hyperthyroids with a mortality rate of well under 1 per cen. The cause of the disease, as is the case with medical treatment, is not eliminated. In contras permanent remissions resulting from the medic treatment have yet to be established and the motality rate is comparable to that caused by sugery

It seems, however, that at least one half of t patients treated with antithyroid drugs a greatly benefitted and may obtain a permane remission Employed with judgment at understanding, then, throuracil and its derivativ benefit at least half of the patients receiving the and when used to prepare patients for surgic treatment, they have increased the safety For a selected for operation for many patients these drugs make an operation avoidable form of these antithyroid drugs, soon to becor commercially available, is 6-propyl thiouracil, which has proved experimentally to have a much lower incidence of toxic reactions than thiouracil 10 Nevertheless, this new drug has caused toxic manifestations in 2 per cent of the cases and its indiscriminate use in patients who do not have true hyperthyroidism may actually be disastrous

At the present time we are using this new compound\* to prepare all bad risk patients for surgical treatment, especially those who have complicating diseases. Patients who refuse operation are treated with the drug as are a few selected cases who present hyperthyroidism with small thyroid glands. In this latter group the probable duration of treatment and the uncertainty of permanent cure are explained to the patient so that there is no dissatisfaction and no reverting to operative treatment in the middle of the medical management.

Our total experience with this method of medical treatment is short when compared with many

<sup>\*6-</sup>propyl thiourneil, used in this study was supplied through the kindness of Lederle Laboratories Division American Cyanamid Company, New York City

others who have had an opportunity to use these drugs since their first announcement. For over one year we have been using 6-propyl thiouracil in average doses of 200 mg, per day Thirty pa tients have been so treated and there has been no instance of granulocytopenia. Two patients complained of frequent micturation and one patient of nausea but the drug was not stopped in any of these cases. Six patients were operated upon without difficulty after preoperative preparation with propyl thiouracil and iodine patient has completed a course of treatment and remained symptom free for four months and an other patient has similarly remained symptom free for two months. The remainder of the group are still receiving treatment.

Surgical treatment of recurrent hyperthyroidism is much more dangerous for the patient and is usually more difficult for the surgeon. To this group of patients, propyl thiourneil offers an opportunity to avoid further operation and, thereby to escape from the increased hazards of secondary operations. Four patients in our group are being treated medically for the recurrence of their

hyperthyroidism.

Today, it is becoming more and more common for one who sees many patients with thyroid disease to observe an increasing number of cases treated with some form of medical therapy large a number of these patients do not have symptoms that are caused by their thyroid glands! This fact plus our own expenence with 6-propyl thiouracil leads to the following conclu-

Careful analysis of the symptoms and a careful physical examination will establish a diagnosis in almost every patient. Accurately ascertaining the presence of true hyporthyroidism will prevent the induscriminate use of drug therapy in patients who do not have thyroid gland disease.

2. Thiouracil and its derivatives have reduced the already low mortality from thyroidectomy and they have made it possible to operate upon

extremely bad risk patients.

A few patients, carefully selected, may have a permanent remission produced by medical treatment with these druck. Operative removal is still the treatment of

choice in all nodular goiters

#### THREE DISEASES CAUSE 80 TO 90% OF ALL CASES OF HYPOGLYCEMIA

Eighty to 90 per cent of all cases of hypoglycemia, an abnormally low level of sugar in the blood, result from three diseases which Jerome W Conn M.D. of Ann Arbor, Michigan, defines so that treatment

may be more successful.
Writing in the May 10 issue of the Journal of the American Medical Association, Dr Conn differen

trates the three types as follows

Functional hypernsulinism is caused by over-secretion of insulin in the pancreas. Insulin trans-forms carbohydrates for body use but its over production deprives the blood of necessary sugar Symptoms are weakness irritability fatigue, sweating and dizziness. This type is not progressive in severity. It occurs more frequently under amotional or physical tension which acts as a stumulus. Hypoglycemic attacks occur two to four hours after meals. Dr Conn found that a high protein low earbohydrate diet is successful in the management of this type of hypoglycemia. Organic hyperinsulinism is caused by the growth

of a tumor or tumors in the pancreas which stimu-

late the production of insulin.

This type is progressive in frequency and severity of attacks which occur before breakfast from two to eight a.m and two to four hours after meals. The attacks are precipitated by skipped or late meals or exercise. Removal of these tumors results in complete alleviation of the entire disturbance without recurrence in the vast

majority of cases.

The third type hepatogenic hypoglycemis, as traceable to changes in the liver This organ is responsible for the storage of glycogen which is converted into sugar as the needs of the system require. However if this storage does not take place because of some condition such as a diseased gallbladder then the body is deprived of its needs. This type of hypoglycemia is also progressive in frequency and severity with attacks occurring before breakfast. These patients should be put on a diet both high in carbohydrate and high in protein

## PROBABLE NASAL DIPHTHERIA, WITH OBSERVATIONS ON SCHICK TESTS

Joseph S Fribush, M D, New York City

W/ITH the rising incidence of diphtheria noted by observers in Europe, Nova Scotia, and upstate New York,1 this case is reported, along with observations of Schick tests performed in private practice, in order to focus attention on the eternal vigilance necessary in the fight against this disease While nasal diphtheria is today an unusual form of infection, it was well known thirty years ago as described in 1913 by McCollum and Place <sup>2</sup>

S G, a 41/x-year-old white boy, was seen on October 5, 1946, because of a purulent discharge from the left nostril This had been present intermittently since August, 1946, at which time he had been in camp Sharing the same bunk with him at that time was another child who had a prolonged, untreated rhinitis of unknown cause

The left nasal discharge was noticed first sometime in August, but had cleared up spontaneously and then recurred in October There were no systemic manifestations observed except for some loss

of appetite

The past immunization history was as follows

Three injections of 1 cc each of plain diphtheria toxoid at 9, 10, and 11 months of age

2 May 24, 1945 Schick test positive, control

negative 3 June 9, 1945 1 cc alum precipitated diphtheria tetanus toxoid September 29, 1945 1 cc alum precipitated diphtheria tetanus toxoid

No repeat Schick test was done

Physical examination revealed a thick mucopurulent discharge from the left nostril and the presence of a thick, yellowish membrane extending from the floor of the nose up along the lateral wall. This membrane bled when an attempt was made to remove a portion of it The remainder of the physical examination, including temperature, was normal except for residua of mild rickets and some pallor A culture was taken immediately and sent to the Health Department which reported it positive for diphtheria bacilli The next day another culture was reported positive and a 12,500-unit dose of antitoxin was given intramuscularly

Schick tests on the mother and the 9-year-old sister were negative, while the father had a positive Schick test with negative control Nasal cultures from mother, father, and sister were all negative These nasal cultures were again all negative on Oc-

tober 16 and November 1, 1946

The child received local therapy by means of penicillin in saline drops and nasal packs of this same material On October 12, 13, and 14, the nasal cultures were negative. By October 13 the membrane had receded markedly until only a small patch remained on the floor of the left naris and local penicillin therapy was stopped At no time were any systemic manifestations of toxicity observed. The child's appetite improved and he behaved like a normal boy

On October 16, the nasal culture was negative but a throat culture taken for the first time was positive On October 18 and 19 both nose and throat cultures On October 20, however, both nose were negative and throat cultures were reported positive for diphtheria bacilli In the meantime the child had received no furthur therapy, and it was noted that the membrane had recurred and was almost its original

At no time was a sanguinous discharge ob-

served, nor did he ever appear sick

From October 26 to October 28, Paredrine-sulfathiazole was used locally in the form of drops and packs With the report of a positive throat culture, however, on October 28, it was decided to attempt intramuscular penicillin in beeswax and oil cubic centimeter (300,000 units) of this preparation was administered daily for six days. This resulted in a marked diminution in the membrane, although a small grayish-white patch could be seen on the floor of the left nostril about one-half inch inward

Examination of the nose on November 2, 1946, revealed no foreign body A slimy, sticky mass of grayish-white mucus was sucked out from the floor of the left nostril, leaving a small ulcerated area beneath it. The Schick test on November 5 was negative, the blood count revealed a mild iron deficiency anemia, and the electrocardiogram showed no dis-turbances in the conduction mechanism

On November 4, 1946, after the child had been discharged by the Health Department because of two consecutive negative cultures of the nose and throat, the culture of October 26 was reported as avirulent

### Comment

Whether this case could have been considered truly one of anterior nasal diphtheria depended entirely on the virulence of the organism isolated at the onset of the disease The routine procedure of the New York City Health Department is to perform such virulence tests only after twenty-one days have elapsed from the original positive culture In the meantime, with the clinical picture as it presented itself, I felt justified in immediately instituting antitovin therapy Such, I believe, is the wisest procedure in the vast majority of similar situations Would it not be advisable, however, routinely to perform virulence tests on all positive diphtheria cultures originally, while concurrently administering antitoxin immediately? Most cases of diphtheritic involvement of the nose recorded in the literature (Kane, 3 Stux4) occur in infants in whom usually there is no previous immunization However, Neubauer reports 50 cases of all types of diphtheria occurring in inoculated children Gibbard et al reported 23 cases in fully immunized patients and observed that no deaths or serious illness occurred among them 6

The use of penicilin was based upon the work of Skinner who reported that of 25 patients receiving 50 to 100,000 units of parenteral penicillin daily for repeatedly positive virulent intermedius type throat cultures, 16 became negative 7 From a theoretical standpoint, it is conceivable that a virulent diphtheria bacillus may be converted into an avirulent form as the result of treatment, although most cases

become negative following antitovin

## Personal Experiences with Shick Tests

Of a series of 128 children who received Schick and control tests, 9 cases were found to be positive Every one of these 9 had negative control reactions

TABLE 1 -POSITIVE SMICK TESTS

An additional 4 cases had combined reactions, namely positive Scheck and positive control. The wast majority of children were tested six months to two years after immunization had been completed and all were tested later than three months after the last immunizing dose

The distribution of the immunizing agent used was as follows plant toxold, 69 cases perdipigen fluid 35 cases alum precipitated diphtheria tota nus, 3 cases, alum precipitated diphtheria, 1 case

unknown agent, 14 cases.

Table 1 shows the significant data in each case with a positive Schick test. It is interesting to note that in no case of primary immunization was perdipigen used. However no definite conclusion can be drawn from this because of the small series of perdipigen immunizations. Three patients after a second ary immunization course were shown to have a negative Schick test.

Table 2 lists the combined reactions. Since the exact agnificance of a positive Schick test is obscured by the allergic control reaction, I feel now that it is wiser to relimination these children. This table also shows the value of the control test. Topely and Wilson describe the combined reaction as one in which the control test has faded considerably by the fourth day thus indicating a positive Schick test with an allergic reaction to the toxin substrate. They differentiate this from the pseudoreaction, in which both the Schick test and the control disappear by the fourth day. Teaving some alight degree of reddish or brownish discoloration.

An incidence in this series of 7 per cent positive Schick tests plus an additional 3 per cent incidence of combined reactions illustrates the utility of this test in private practice. These figures also indicate the failure of careful immunization to result in a negative Schick test in a small percentage of cases. Volk and Bunnev report that 7 per cent were not immune following three injections of fluid toxoid whereas they found only 2 per cent were not immune following two injections of alum precipitated tox

Schwarz reported his experiences with the Schick test in private practice and found the following 2

- 1 Of 150 children who received two doses of toxold and were Schick tested four to ten years later 22 per cent were positive
- 2 Of 77 children who received one dose of alum precipitated toxold, 16 per cent were Schick positive three to five years later
- No mention of control tests was found in his article Banjamin Fleming, and Ross using controls, reported 14.9 per cent positive Schick tests in 1 522 Montreal children tested five to eleven years after the third dose of toxoid <sup>11</sup>

The following conclusions are drawn from the above for use in private practice

- 1 All children should receive a Schick test and control three to six months after the last immunizing dose
- 2 If positive a secondary immunization course with alum precipitated diphtheria toxoid should be done and followed by a repeat Schick test.
- 3 A combined reaction should result probably in reimmunization without repeating the Schick test.
- 4 The Schick test should be repeated before entering school.

#### Conclusions

1 Every case of unliateral nasal discharge in any age group regardless of previous immunization history, should be cultured for the presence of diph theria.

TABLE 2.—POSITIVE SCRICE AND POSITIVE CONTROL TESTS

Name	Ар	Sex	Primary Immunisati n	Time After End of Primary Immunication	Secondary Immunication
1. R.G.	3 years	F	Plain toxold—3	2 years	Alum precipitated diphtheria tet
L E.G	2 years	F	Alum precipitated diphtheria tetanus	1 year	Alum precipitated diphtheria tet
8. K.O.	41/4 years	r	7	8 уевгя	None (covered with hivee the next
1 M. B.	11/ years	F	Perdipigen fluid4	9 months	day) None

- In atypical localizations of the diphtheritic membrane, it would be desirable to do a virulence test at the time of diagnosis Antitoxin, however must be given immediately in the presence of the clinical picture and a positive culture
- In private practice, the Schick test is demonstrated to be of great value and should be performed routinely

#### Summary

A case of probable nasal diphtheria occurring in a previously immunized child is reported along with personal observations on Schick tests in private prac-

### EXPANSION OF STATE'S HEALTH RESOURCES UNDERSCORED

In a talk before the annual meeting of the Fifth District Branch of the Medical Society of the State of New York in Utica, September 30, Dr Herman E Hilleboe, state commissioner of health, emphasized the need for expansion of the State's resources and extension of action along four major lines recruitment and training of professional personnel, expansion of local health departments and their services, vigorous pursuit of the challenges of program planning and enlargement of the scope of fundamental and applied research, and encouragement of the fullest cooperation between the local health officer and the general practitioner

He said in part "We must expand health services rapidly throughout the State and achieve a high level of efficiency Although the madequate resources of professional personnel-medical officers and public health nurses-make this task exceedingly difficult, we must go forward immediately to recruit promising candidates who can be trained to Long-range plans for training must to do the job be developed, but while such a process advances we must do all we can to increase the effectiveness of available personnel

"As health department programs become more inclusive, we must be on guard against too much centralization, we must work more closely among the people and bring health services directly to them in their communities and their homes through local health units, county and city, manned by welltrained professional people

"Now that the war is over we must review the program of every division of our health department with an eye to making whatever changes and improvements are necessary to provide the greatest efficiency and make available every possible public health service to our people. To accomplish this we will work closely with the Committee on Public Health and Education of the Medical Society of the State of New York

"The general practitioner and the full-time local health officer together are the basic elements of The former 18 curative and preventive medicine still the most important force in the control of disease in the community Participation by the private physician in the activities of the local health department must be stimulated and encouraged. The local health officers and the rural physicians have the sole responsibility of extending the frontiers of medicine in rural areas Therefore, we must have many more of both of them, and they should be within the geographic and economic reach of the people at all times

-Health News, October 13, 1947

#### FULMINATING MENINGITIS AND INTRATHECAL PENICILLIN

BTRON D ST JOHN M.D., Port Washington New York

28-YEAR-OLD white woman, was admitted A unconscious to the hospital on December 25, 1945 Her illness was given by the family and the

family physician as follows

On the previous day December 24 1945 the patient had had symptoms of an ordinary cold, but had felt well enough to go to a neighboring town to attend a family party. On rising the next morning, she had symptoms of a cold and at 11 00 a.m. had developed a slight headache, which went on quickly to nausea, vomiting, and difficulty with vision, and at 2 00 r.s. the family doctor was called. He found that she had a stiff neck, and made a diagnosis of meningitis. After giving her 5 Gm. of sulfadiazine by mouth, he sent her to the hospital. She was ad mitted unconscious at 4 00 P.M.

Part History -The patient was one month postpartum. She had never been ill, except for the usual childhood diseases, and there was no history of sinus infection or of outla media. The family history revealed that the mother father, and three brothers were living and well. The history by systems failed to reveal any important facts.

Physical Examination.—The temperature was 104 F., pulse 120 and respirations were 18. Lying on her left side the patient cried with pain when an attempt was made to turn her head to the right. She roused when spoken to loudly but did not obey commands. The pupils were small and reacted to light. There was no deviation of the eyes and no apparent nystagmus. The neck was very stiff The cars and nose were negative, throat was pink, and the tonsile were large. There were no cervical, clavicular or arillary nodes. The breasts were normal. The lungs were clear throughout. The heart showed the maximum apex impulse within the midelavicular line. No murmurs were heard. The aortic second sound equaled the pulmonic second sound. There was a regular sinus rhythm The ventricular rate was 120 The abdomen showed the abdominal reflexes absent, no masses, and no rigidity The skin showed no rash and no evidence of petechiae. The patient lay on her left side with her knees flexed. Neurologic examination showed a marked rigidity of the neck with a possible Babinski Abdominal reflexes were absent and

there was a positive hernig.

Progress Notes Laboratory Fundings and Treatment.—On December 25 at 4 30 p.m., a spinal tap was done. The initial pressure was 44 mm. of mercury and the final pressure was 10 mm. cell count was 13,700 and mostly polymorphonu clears. No organisms were found on smear or cul-ture. Blood was taken for a culture, count, and chemistry Routine examination of the urine was made. The patient was now totally comatose not

responding to any stimuli

The patient had been nek only five and one-half hours and was now moribund and of course, we realized that we were dealing with a fulminating meningitis of unknown etiology that almost surely would end fatally in the next twenty four hours. The usual dose of 20 000 units of peniclilin had been prepared to be given intratheonly but it was docided that, in view of the extreme rapidity of onset of these symptoms, we would be justified in giving a larger dose One hundred thousand units of penicillin were dissolved in 5 cc. of spinal fluid and were given very slowly by the intrathecal route, in jecting 1/2 cc. and withdrawing 1/2 cc. and, then, injecting 1 cc. and withdrawing 1 cc.

The amount injected was gradually increased until at the end of three-quarters of an hour the last of the fluid was given After the last cc. was injected, the patient suddenly became disturbed and thrashed about in the bed so violently that she had to be restrained and was given sodium amytal, Five Gm. of sodium sulfadiazine were given intravenously Stat., and 50 000 units of penicillin every three hours intravenously A Levine tube was passed through the nose to the stomach, so that the patient could be given sulfadiazine, 2 Gm. every four hours. This treatment was carried out through the night with constant restraint being necessary

On December 20 at 9 00 A.M., the temperature was 102 F and the patient was stuporous but did respond to painful stimuli and repeated questioning. She had a warm, dry skin, and flushed face. There was painful stiffness of the neck, and positive Kernig and Brudzinskı signs. The lungs were clear Blood culture and spinal fluid culture were negative. A spinal tap at 2 00 r.u showed a cloudy yellow fluid, initial pressure was 32 mm. of mercury, final pressure was 10 mm. Twenty-five thousand units of penicillin were given intrathecally 2 Gm. of sulfadiazine every four hours were given by mouth, and 50 000 units of penicillin, intravenously The report on the spinal fluid showed a cell count of 72,000 mostly polymorphonuclears sugar in a reduced amount, chlorides 648.5 mg, total protein 975 mg. The blood count showed 6,000 white cells with 94 per cont polymorphonuclears and 6 per cent lymphocytes, the unne contained a trace of albumin and many red cells. Blood chemistry showed a nonprotein nitrogen of 21 mg, per 100 cc. of blood reatinine 1.5 mg., blood stigar 190 mg, suifa level
12 mg., and a negative Kahn test. At 3 00 r m the
patient became conscous and answered questions
quickly and accurately Her temperature was 99.8
F by rectum. There was less neck rigidity and there was marked strablemus and nystagmus. An eye consultation revealed divergent paralysis with possibly some involvement of the left, sixth nerve.

On December 27 the nose and throat cultures were negative. The blood culture was sterile after forty eight hours. Spinal fluid culture showed no or ganisms. A spinal tap was done initial pressure was 12 mm. final pressure was 6 mm. Twenty five thousand units of penicillin were given intrathecally. The cell count of the spinal fluid had dropped to 6 300 with 30 per cent polymorphonuclears. The patient was given sulfadiatine, 2 Gm. every four hours by mouth. The urins report was negative On December 23 the patient was greatly improved No tap was needed.

On December 29 she had a severe headache. A spinal tap was done, with the initial pressure 13 mm. and the final pressure, 9 mm. 8 cc. of opalescent fluid were removed. The temperature was 100 F by

On December 31 her temperature was normal and all medication was discontinued. On January 1046, there was no nystagmus, squint, nor double vision. Her neck was not stiff The patient was free of all symptoms and felt fine There were no abnormal reflexes and the abdominals were still absent. On January 7 the patient was discharged home and there were no residual signs or symptoms

On November 11, 1946, it was reported that this patient had remained in perfect health since leaving the hospital and, at the time of this re-

port, was six months' pregnant.

Dr Clement Boccalini has now reported to me that she had a spontaneous delivery of a normal infant on February 26, 1947, with an uneventful antepartum and postpartum period

### Summary and Discussion

A case is reported of fulminating meningitis that was vigorously treated during the early hours of the disease with special attention to the large dose of penicillin intrathecally Speculations as to whether this patient, untreated, or less vigorously treated, would have had adrenal hemorrhages, shock, and death, as seen in Waterhouse-Friderichsen syndrome, are futile

Many deaths are reported in cases with similar onset and in cases with much longer onset of symptoms where no penicillin is given intrathecally Penicillin is probably not needed in the case of proved meningococcic meningitis, while in the case under discussion no organism was found

Often the clinical diagnosis of the meningococcic meningitis is made on the basis of symptoms related above, plus the typical rash, and the only remedy given is the sulfa drug because of the well-known efficacy of this antibiotic in meningococcic menin-This is a bad practice and not in the best interest of the patient, because all too often the laboratory fails to find the meningococcus, and valuable time has been lost before penicilin is started Therefore, it would seem that if the original examination of the spinal fluid sent to the laboratory for immediate examination fails to reveal any organisms, the patient should receive sulfa drug intravenously and orally, and penicillin intravenously and intrathecally, and if the symptoms are fulminating, the patient should receive extremely large doses of penicillin by the intraspinal route Streptomycin is rapidly gaining a position of importance in the treatment of meningitis

### 'DOCTOR JONES" SAYS-

Manners and public health did you ever stop to think how they hook up, sometimes? Or that health departments've been responsible for manners being

improved in certain respects?

How often, nowadays, do you see anyone spitting on the floor in a public place or even on the sidewalk? In fact, it's so seldom that the younger folks-it probably wouldn't occur to most of 'em that it ever could've been common enough to've been a serious

And yet, not over thirty-five or forty years ago, "No Spitting" signs were plastered all over the landscape trains, trolley cars, buses, trees, even in places like restaurants and theaters. And, even then, they had to have cops around to watch 'em Cuspidors were a regular part of the equipment in most public places—a good many private ones, too

Yes, I can remember when they had signs in the County Court House "Spit in the Spittoons" They made it direct and to the point, hoping the spitters'd do as well They tell me about the cop that was on duty and had his eye on a fellow sitting near one of the signs Finally he went over and poked him "Don't jez see that sign?" he says

"Well then," the cop says, The fellow said he did "why don't yez spit?"

It might ve been the beginning of the drive against tuberculosis that started the movement to stop promiscuous spitting. They figured the disease germs could be blown around in the dust and so on Now it's mainly a matter of good manners

Then, when we had the big influenza epidemic, in 1918, they decided folks coughing and sneezing in other people's faces was helping to spread the disease. And, of course, there's other diseases as well where the germs are in the mouth and nose discharges

Anyway, they began putting up illustrated plac-ds "Cover Your Sneezes" and so on That wasn't quite thirty years ago and, already, it's begun to dawn on a lot of people that keeping their coughs and sneezes to themselves—regardless of scattering

germs, it's just ordinary good manners And there's other stuations, not so obvious, where good manners and health hook up "evil communications corrupt good manners," so Meander, the dramatist, said—and the Apostle Paul quoted it They might've added and evil manners spread communicable diseases—Health News

#### MECHANICAL INTESTINAL OBSTRUCTION

BENJAMIN A SCHANIZ, M D, and RICHARD S KAMIL M.D, Middletown New York

(From the Maddletown State Hospital)

A LTHOUGH there have been numerous reports of various substances having been swallowed accidentally or deliberately, we believe that this case deserves mention because of the large amount of foreign material ingested and the protein symptoms which resulted No effort will be made to discuss the dynamics of the underlying per sonality except to indicate that the patient was suffering from a chronic dementia.

#### Case Report

The subject is a 35-year-old man who had been hospitalized in a mental institution for ten years with a diagnosis of schizophrenia, catatonic type Always a markedly retracted individual, devoid of spontaneous reaction, lacking responsiveness and almost mutistic, it was surprising that he should now complain of pain and discomfort.

Nausca and vomiting were conspicuously absent In addition to the subjective symptoms there were objective signs which warranted consideration. He had a temperature of 99.2 F, a pulse rate of 94 but no increase in respiratory rate. Blood pressure was 110/78. His abdomen was markedly rigid but it was the impression of the writers that much of this rigidity was voluntary Palpation over the stomach elicited exquisite pain which was particularly marked in the left lower quadrant Auscultation of the abdomen was difficult because of the continuous groaning by the patient but no bowel tones were hard. Rectal examination revealed tenderness upon stretching the pelvic peritoneum and, also most pronounced in the left lower quad rant. Roentgenologic examination was not available. A leukocytonis of 18,000 with 85 per cent polymorphonuclear neutrophils was obtained on blood examination.

Since it was known that the patient had a habit of ingrating foreign material such as blankets clothing, sticks, and the like a tentative diagnosis of small bowel perforation was offered.

Under a general anesthesia, a large parimedian incision of about 15 cc. was made. There was no exudate in the peritoneal cavity and the small bowel immediately came into view. It was noted that there was a solid rectangular mass at the ter minal part of the jejunum about 18 cc. in length. It exerted marked pressure on either end, producing areas of blanching where the pressure was noted at either end of the foreign part. A longitudinal incision was made in the small bowel and the mass re-

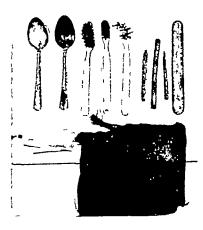

Fig 1 Foreign bodies removed from ileum, appendix, and stomach of patient.

moved which, on inspection, turned out to be two teaspoons one toothbrush, and a tongue stick matted together with wool fibers from a previously ingested piece of blankst material. The bowel was then closed with horizontal sutures and the rest of the abdominal viscera polpated. The appendix was hard and firm and soutely inflamed. It was moved and two nails about the length of the appendix, and a wood splinter probably from another tongue stick, were found within its lumen. Further exploration revealed foreign material in the stomach from which was removed two toothbrushes and a square piece of molesian cloth about 8 inches square. The patient's abdomen was closed without drainage

Postoperative treatment consisted of the usual intertion of a Levin tube attached to a Wanger-stem suction appearatus, together with the use of ponicillin and sodium sulfadaxine as prophylactic measures. The patient made an uneventful recovery with no apparent result on his mental status.

# DEPARTMENT OF WORKMEN'S COMPENSATION

CONDUCTED BY DAVID J KALISKI, M D, DIRECTOR

Viewpoints of Workmen's Compensation Administration as to Occupational Diseases\*

WORKMEN'S compensation legislation has evolved more uncertainly and slowly in occupational diseases than with respect to accidental injuries. Modern chemical and technologic developments necessitate equal advances in industrial medicine and in workmen's compensation legislation.

Medical knowledge is largely in the possession of a small group of medical scientists and not sufficiently spread among general practitioners who see the bulk of workmen's compensation cases. It is necessary to arouse what Miss Donlon calls informed curiosity on the part of the medical profession in respect to industrial diseases, so that these patients may be recognized and thus adequately treated and compensated

The second injury law passed in 1944 extends to all cases of industrial injury and occupational diseases, and is financed through annual pooled carrier contributions spreading the cost over industry as a whole. The new dust disease law, which became effective in 1947, limits the employer's liability to the first five years in cases of total disability and death, the balance of liability being charged against the Second Injury Fund. Workers get full compensation benefits, but a substantial part of liability is transferred from individual employers to the industry as a whole

Now a worker disabled by one of the enumerated diseases may file a claim for benefits and give notice to his employer within 90 days after disablement and after knowledge that the condition was due to his employment, notwithstanding the lapse of more than the usual short statutory periods of limitation with respect to notice, claim filing, etc. Where death is caused by one of these slow developing diseases, benefits may be awarded to dependents where death ensued within five years after contraction of the disease

New York State has a sound and forward looking interest in workmen's compensation measures and in some respects there is no counterpart in other states in respect to occupational diseases. Current views of workmen's compensation administration in pul monary and other occupational diseases in New York State are briefly summarized.

- 1 Benefits to disabled workers should be no less for an occupational disease disablement than for a traumatic disability
- 2 The medical characteristics of certain latent or slow starting diseases call for a realistic period of limitation not measured from last exposure
- 3 The burden of workmen's compensation costs may be a serious deterrent to the employment of workers who, in previous employment, have been injuriously exposed to hazards that cause progressive deterioration, as in the dusty trades Spreading excess workmen's compensation costs to industry as a whole improves employment opportunities.
- 4 Similarly, the middle aged and older workers, and those of all ages who have permanent physical impairments, are more readily employable when excess workmen's compensation costs for second injury or occupational disease are lifted from the employer and transferred to a Second Injury Fund.
- 5 Rehabilitation of workers who would be harmed by return to an occupational exposure calls for payment of workmen's compensation benefits until earnings in a medically safe new employment equal those in the medically unsafe old employment.

Miss Donlon seeks the cooperation of the medical profession at every level, especially in occupational diseases. Expert consultants are available throughout the State to give competent diagnosis, prognosis, and opinions on casual relationship and treatment. There is urgent need for establishment of accepted standards in such matters as laboratory and tray examinations. There is need for more emphasis on industrial medicine in medical education. "A society whose survival is dependent on possession and use of the most modern processes of industrial production requires for survival also sound medical knowledge as to the hazards inherent in those processes."

<sup>\*</sup>An address by Miss Mary Donlon Chairman of the Workmen's Compensation Board of the State of New York at the Sixth Saranac Symposium at Saranac Lake New York, on Friday October 3 1947 Owing to the shortage of space we regret the inability to publish in full Miss Donlon's excellent article. It bears a message of peculiar significance to all physicians authorized to treat workmen's compensation claimants. You are urged to obtain a copy of the full article from Miss Mary Donlon, Chairman of the Workmen's Compensation Board. 80 Centre Street, New York 13 New York.

# MEDICAL NEWS

## Union Plans Health Center

THE International Ladies Garment Workers Union has begun a \$1,000,000 expansion project for its Union Health Center at 275 Seventh Avenue, New York City, it was learned recently from Dr Leo Price, the center's director Half completed at present, construction and installation work is expected to be finished by next summer

At present an estimated 2,000,000 in vanous unions under collective bargaining now have health and benefit programs, with John L Lewis' coal miners most notable among this group. Many of these unions are considering supplying their own medical service, according to the announcment made by Dr Price.

## Nurses Have Civic Responsibility

NTURSES as individuals and as a specialized group must break out of their "professional seclusion," recognize the tie-up of politics and everyday life and "be prepared to take the initiative with respect to all economic, social, and political problems" affecting their interests, Ralph E Becker, chairman of the Young Republican National Federation, told a meeting of nurses recently

Mr Becker spoke at a sectional luncheon of the joint convention of the New York State Nurses Association and the New York State League of Nursing Education at the Hotel Pennsyl-

Discussing the civic responsibility of nurses, he emphasized the need for practical political knowledge "Unless you will take an interest in government and actively participate in some way in its affairs, you will be the loser," he declared. It is the responsibility of the profession to "make the rest of the people aware of what your profession is accomplishing, what its needs are, and what it contributes to society as a whole," he concluded

## Masons to Fight Rheumatic Fever

A MASONIC Fund for Medical Research and Human Welfare has been organized by the Masonic Grand Lodge of the State of New York to support intensive research into the causes and possible cures for rheumatic fever, it was announced recently

Backed by prominent child-care specialists, the order will engage in a fund-raising campaign from January until May Funds will be solicited only from the organization's 270,000 members in the State, but will be available for all, regardless of affiliations or geographical location. The doctors who will be asked to serve on a medical advisory

commission to the fund are Dr Ralph H Boots, assistant clinical professor of medicine at the College of Physicians and Surgeons, Columbia University, Capt Morris Brooks, USNR, assistant district medical officer, Third Naval District, Dr Russell L Cecil, School of Medicine, Cornell University, Dr Arthur C DeGraff of N Y U, chairman of the board of Irvington House, a home for rheumatic children in Irvington, Brig. Gen Guy B Denit, surgeon, First Army Area, Dr Francis Schwentker, pediatrician-in-chief, Johns Hopkins University, and Dr George C Woodford, medical director of the Home Life Insurance Company

## International College of Surgeons Inducts Members

A T THE Twelfth Assembly and Convocation of the United States Chapter, International College of Surgeons, held in Chicago on October 3, the following New York State doctors were among the 810 surgeons inducted into the college Fellows—Drs Louis Kleinfeld, M Russell

Fellows—Drs Louis Kleinfeld, M Russell Nelson, Salo Marek Boltuch, Joseph Laval, Hermann J Lukeman, Robert Gutierrez, Meyer Leo Goldman, Horace E Ayers, Thomas J Kirwin, Lester H Moskowitz, Jerome Wagner, and Abbey David Seley, all of New York City, Sherman W McIlmoyl and William T Shields, Jr., Troy, Kenneth Thomas Bowc, Hornell, Louis H Baretz, Bernard N Gottlieb, John J Black, and Bernard Pines, all of Brooklyn, Dante James Morgana, Lockport, William Vernon Wax, Catskill, Leslie A. Dickinson, Michael Jay Crino, Francis R. Daniels, James S Houck, Lynn Rumbold, and Leo Francis Simpson, all of Rochester, Joseph D Hallinan, Richmond Hill, Isidore Berger, the Bronx, Peter Byron, Corona, Henry Hillel, Syracuse, Austin B Johnson, Far Rockaway, Anoch H

Lewert, Jamaica, Giacento C Morrone, Yonkers, Alexander Cameron, Hempstead, and Christopher J Di Crocco, Staten Island

Associates —Drs John Francis Connor, George E Martin, and Adolph Glaser, all of Troj, I. Harvey Schotter, Irving Kalow, Joseph M Armergol, Harry J Bobb, Max B Nathanson, and Henry I Scheer, all of New York City, James Raymond Kelly, Hornell, David J Weyler, Islip Terrance, William F White, and James G Kanski, Buffalo, Michele Angelo Raffaele Raia, Louis J Baskin, and Anthony F Sava, all of Brooklyn, Roman R. Violyn, Amsterdam, Myron L Hafer, Patchogue, Francis A Mastrianni, Mechanicville, George E. Christman, Far Rockaway, Harold Couriney, Syracuse, Dudley B Fitz-Gerald, Lockport, and Edwin R. #### MEETINGS-PAST AND FUTURE

Association for the Advancement of Psychotherapy

Dr Emil A. Gutheil, New York City spoke on Training in Psychotherapy" at the monthly meeting held on October 31 at the Academy of Medicine Building, New York City

Rochester Academy of Medicine, Obstetrical and Gynecological Section

Observing the one hundredth anniversary of the discovery of the cause and prevention of puerporal fover by Semmelweiss, the Section held a dinner meeting on October 14 at the Rochester Academy of Medicine. Dr Palmer Findlay of Omaha, Nebraaka, was the guest essayist.

American Association for the Study of Goiter

The annual meeting will be held at the King Edward Hotel Toronto Canada, on May 6, 7 and 8, 1948. Program for the three-day session will consist of papers dealing with golter and other diseases of the thryoid gland, dry clinics, and demonstrations.

National Society for the Prevention of Blindness

Of interest to persons who are directly or indirectly concerned with eye health and safety will be the three-day conference to be held on April 5 6 and 7 1948, at the Hotel Radisson, Minneapolis Minneaota.

Details concerning the program may be obtained by writing to the Society at 1700 Broadway, New York 19 New York.

Eastern New York Eye, Ear Nose, and Throat Association

Meeting in Albany on October 2, the Association participated in a Clinic Day at the Albany Hospital attended a dinner at the Albany Country Club, and conducted a business meeting and selentific session Guest speaker was Dr Lyman Richards, of Boston who gave a talk on the psychosomatic factor in ophthalmology and otolaryngology

At the November 6 meeting, held at the Hendrick Hudson Hotel, Tro, guest speaker was Dr Russel N de Jong, head of the neurological department of the University of Michigan Medical School, Ann Arbor Michigan. Dr do Jong's topic was neurology as related to ophthalmology and otolaryn gology Discussion of his paper was ked by Dr Robert D Whitfield, Albany and Dr Isaac Shapiro Schénectady

Rochester Academy of Medicine

Dr John H. Tulbott, professor of medicine at the University of Buffalo School of Medicine spoke on "The Pathogenesis and Treatment of Gouty Arth ritis at the October meeting of the Academy Participating in the discussion following the presentation were Dr Samuel H. Baasett and Dr Jacob D Goldstein, of the University of Rochester School Medicino, and Dr Charles L. Steinberg, associate attending physician at the Rochester General Hospital.

At the November meeting Dr Harold G Wolff associate professor of medicine at Cornell University Medical College, spoke on 'Headache Mechanisms'

#### PERSONALITIES

Honored.—Colonel Jos. ph Haas who was awarded the Legon of Ment at a cormony in the Seventh legimental Armory New York City for exception ally mentoficus conduct in the performance of out standing services as commanding officer of the 120th Station Hospital from September 16, 1942, to August 21 1945 A graduate of Fordham University Hedical School, Dr Haas entared the service in July 1942, and has also been awarded the Bronze Star Medal Dr Robert J Booher associated with the Pack Medical Group New York City, who addressed the annual meeting of the Gulf Coast Clinical Society in Mobile, Alabama, rocently on Recent Advances in the Treatment of Cancer of

Recent Advances in the Treatment of Cancer of the Gastrointostinal Tract Dr George Schwarts, New York City who lectured on Heart Block' on October 21 at the Parkchester General Hospital, under the sponsorship of the New York Council of Surgeons, and Dr Milton Birnkrant, New York City who lectured on Interesting Cases from the Department of Park.

Department of Radiology on October 28. Appointed.—Dr Ethan Flagg Butler Elmira former consultant on thoracic surgery at the Veterans Administration Hospital at Sampson as chief medical director for the Veterans Administration in Now York State Dr Llonel Dichtor, physician-in-residence at the Arnot-Ogden Hospital, Elmira, as medical officer of the Elmira Naval Reserve Unit Dr Suo Thompson Goull former

Columbia County Health Commussioner and a director of the American School Health Association, to the committee on the selection of those persons entitled to fellowships in the American Public Health Association Dr Frank P Light, to the post of chief of the department of obstetries and gynecology at the Long Island College Hespital, succeeding Dr Alfred C Beck Dr John G Lynn, former chief psychiatrist at Grasslands Hospital, Valhalla, to the post of director of the Bureau of Mental Hygene, Territory of Hawaii.

New Offices.—Dr Michael A. Colella, Rome, for

New Offices.—Dr Michael A. Colella, Rome, for practice of general medicine and neuropsychiatry in Utics. Dr Charles Wilson Collins, former commander in the United States Navy Medical Corps, general practice in Saratoga Springs. Dr Guido A De Blasio recently discharged from the United States Army as a major in the Medical Corps in Mount Vernon for the practice of surgery. Dr Charles L. Dubuar, general practice in Barneveld in association with Dr. Albert C. Redmond Dr. Parker Hoffman, of Painted Post, EENT practice in Corning. Dr Charles Maxwell Hower formering the Corning of Bloomsburg Pennsylvania, practice of surgery and medicine in Elinira. Dr. David H. MaoFarland, practice of urology in Utics, succeeding his faller the late Dr. Howard D. MaoFarland. Dr. Joseph Mellow, former chief of urology at the United States Army Eighth Station Hespital in the Pacific

theater, general practice in Port Washington Dr John D Sponnoble, general practice in Gloversville Dr James H Van Marter, recently discharged

from military service with permanent rank of Lieutenant Colonel, Medical Corps, general practice in Groton

Dr Alexander Wolf, after five years' service

in the United States Army as director of the group psychotherapy program at Fort Knox, Kentucky, neuropsychiatrist at the 108th Evacuation Hospital and chief of professional services in the Ninth Army Combat Exhaustion Center in the European Theater, practice of neuropsychiatry in New York

## COUNTY NEWS

#### Canandargua County

Dr C Harvey Jewett was host to members of the Canandaigua County Medical Society at the October dinner meeting at his home in Canandaigua Dr Jewett presented a paper on "The Rice Diet for Hypertension," and Dr Frederick C McClellan gave a report of the meeting of the American Uro-logical Society recently in Saratoga Dr James F Maltman was host for the November

andaigua Talks were Hurlbutt, Rushville, 7 meeting at the Hotel Canandaigua presented by Dr B C Hurlbutt, Ru and Dr J Wendell Howard, East Bloomfield

## Cattaraugus County

Dr F P Keefe, of Olean, spoke on "Skin Grafting—Indications and Modern Technics" at the meeting of the Cattaraugus County Medical Society, held on October 16 in Glean The speaker was introduced by the president, Dr J S Fleming

Joining with the Society at a dinner preceding the meeting were members of the County Woman's Auxiliary, who held a separate business meeting

#### Cortland County

Postgraduate instruction, arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York for the Cortland County Medical Society, was held on November 21 at the Cortland County Hospital, Cortland

Dr F J Schoeneck, professor of clinical obstetrics at the Syracuse University, College of Medicine, spoke on "Gynecology in General Practice"

## Kings County

The Pediatric Section of the Kings County Medical Society and the Academy of Medicine of Brooklyn will hold the third in its series of scientific meetings on January 26 The speaker will be Dr. H. W. Dargeon, of Manhattan, whose topic will be "Neo-plastic Diseases in Infancy and Childhood" The meetings are held in the Kings County Medical Society building, 1313 Bedford Avenue, Brooklyn, and begin at 9 PM

Dr Abraham Walzer was elected president of the Brooklyn Dermatological Society at the October meeting of the group, when officers were selected to serve for the coming year

Other officers named are Dr E A. Gauvain, vice-president, Dr I N Holtzman, secretary-treasurer, Dr S H Silvers, editorial secretary, and Dr S I Greenberg, assistant editorial secretary

## Lewis County

The Lewis County Medical Society has reaffirmed its policy against publication of names of members treating medical and surgical cases. Dr L A.

Avallone Lowville, president of the group, declared the action was prompted because "publicity is considered unethical and unprofessional"

## Nassau County

Dr Guy F Robbins, from Memorial Hospital, New York, spoke on "What Can the General Practitioner Do About Lowering Cancer Mortallty" at the meeting of the Nassau County Medical Society on October 28 at the Elks' Club, Hempstead The postgraduate instruction was arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York for the county group

The annual dinner dance of the Nassau County Medical Society will be held December 6 at the Garden City Hotel

### Queens County

A motion picture and talks on aviation featured the meeting of the Queens County Medical Society on October 28 at the Society's headquarters "The Paratrooper in the Making," a film released by the United States Army Air Forces, was shown, and Dr M Martyn Kafka, former flight surgeon with the LL

the US Army Air Corps, introduced the topic.
Speakers were Dr Frederick Hopkins Shillito, medical director of the Atlantic Division of Pan-American World Airways and a member of the faculty of the College of Physicians and Surgeons, Columbia University, whose topic was "Who Can Fly," and Dr John M Baldwin, medical director of the Inter-national Division of Trang World Airgans and also a national Division of Trans-World Airways and also a member of the faculty of the College of Physicians and Surgeons, whose topic was "Explosive Decompression in Commercial Aircraft"

A dinner preceded the meeting

The last two in a series of four lectures being given by Dr Henry A. Reisman, director of pediatrics at Queens General Hospital, will be held December 3 and December 10, at 4 30 PM Topics for the remaining lectures are "Congenital Intestinal Disturbances in Children" and "Pulmonary Diseases in Children"

The series is sponsored by the Graduate Education Committee of the Queens County Medical

Society

#### Sullivan County

"Meningitis" was the topic of the lecture given by Dr Emanuel Appelbaum, chief of the Meningitis Division, Bureau of Laboratories, City of New York Department of Health, on November 19, at the Monticello Hospital, Monticello, for members of the Sullivan County Medical Society The postgradu-Sullivan County Medical Society The postgraduate instruction was arranged for the County Society Health and by the Council Committee on Public Health and

Education of the Medical Society of the State of New York, in cooperation with the New York State Department of Health.

Schenectady County

Dr William Dock, professor of medicine at the Long Island College of Medicine spoke on Heart Fallure and Its Management at the meeting of the Schenectady County Medical Society on November

4 at the Ellis Hospital, Schenectady
This was part of a sories of postgraduate in
struction arranged by the Council Committee on
Public Health and Education of the Medical Society of the State of New York.

#### INDUSTRY MUST ASSUME RESPONSIBILITY IN MEDICINE

Business and industry must assume an increasing financial responsibility for the nation's medical schools if the United States is to maintain its leader ship in health control, Chancellor Harry Woodburn Chase, New York University told leading business mon recently

"Faced with the problem of increasing student bodies, without a corresponding increase in income the average medical school in this country cannot hope to maintain its standard of instruction unless business and industry assume their responsibility," Chancellor Chase said — Its only alternative is to Its only alternative is to seek assistance through tax funds, which might lead eventually to government control of health and medicine

Chancellor Chase quoted figures showing that of the total of \$43,000 000 that will be needed to operate the medical schools of this country in 1948, student fees will provide no more than \$12,000,000 and probably less. The remaining \$31 000 000 will be obtained from income from endowments, general university funds, appropriations from tax funds gifts, and similar sources.

Chancellor Chase a challenge came at a meeting of more than 50 leaders in the New York City business section, called by George W Davison, chairman of the board, Central Hanover Bank and Trust Company, in connection with the appeal for \$4,000,000 in glits from business firms for the New York Uni

versity Bellevue Medical Center Dr Howard A. Rusk and Dr Anthony J Lanza, directors, respectively of the Center's Institute of Rehabilitation and Institute of Industrial Medicine also emphasized the importance of future planning by business to assure the health of industrial workers.—The Medical Advance October 1947

#### NATIONAL STUDY OF CONGENITAL MALFORMATIONS AND MATERNAL INFECTION

In an effort to collect more precise data on the relationships between certain maternal infections and congenital malformations a nation-wide study is being sponsored by the American Academy of Pediatrics and the National Society for the Prevention of Blindness.

Questionnaires are being sent to obstetremans, ophthalmologists, and pediatricians, seeking the reporting of cases of German mesales in expectant mothers and of children with congenital defects that might be attributed to other injections in the expectant mother such as measles, chicken pox, mumps, and influenza.

Although an association has been established between the occurrence of German measles early in prognancy and certain congenital defects in the off spring information is lacking as to the frequency with which this happens and as to the possible influ ence of other communicable diseases that might have been contracted by the expectant mother

Data will be studied by the following committee Dr Herbert O Miller, professor of pediatnes, University of Kansas Hospitals, Kansas City, Kansas, Drs. Stewart Clifford and Clement A. Smith, both of Boston Massachurotts Dr Josef Warkany of Cincinnati, Ohio, Dr James Wilson, of Ann Arbor Michigan, and Dr Horman Vannet of Southbury. Connecticut. Physicans knowing of cases are urged to registor them with Dr Miller, chairman of the committee.

# HOSPITAL NEWS

## The Hospital Bed Shortage—Real and Apparent

THE Bulletin of the Hospital Council of Greater New York noted recently the changing demands for various types of hospital accommodations and suggested plans for benefiting the community and the hospitals The hospital bed shortage, according to the Council, is now in a state of change for reasons

other than the incidence of disease

"For this year, and since last year," said the Council, "the demands for ward services have been increasing steadily, while there is less evidence of acute shortage in private and semiprivate accom-Meanwhile the municipal hospitals eing taxed to capacity The improved modations are again being taxed to capacity financial position of civilians during the war years and the emphasis on personal health as a war asset contributed to the sharply increased demand for private and semiprivate accommodations, so that a large number of ward beds then remained empty "

In addition to the recommendation on over-all planning, the Council suggested the following five studies as means by which the community and the hospitals may reduce the number of new general care beds which may be needed flexibility of accommodations, admission practices, size of hospitals. types of facilities required, and types of service re-

Flexibility of accommodations was described as a means of adjusting to meet varying demands for different types of accommodations. It was noted that in 1939 general hospital ward occupancy was 91 per cent, that by 1944 it had dropped to 72 per cent, and that now the trend is upward again Hospital Council, in urging standardization of facilities as the best assurance for complete flexibility, said, "The physical facilities for ward and semiprivate facilities may be identical. The idea is gaining acceptance that it is desirable to reduce the size of wards to a maximum of four beds "

In discussing the size of hospitals as an important factor in reducing the bed deficit, the Hospital Council said that the Commission on Hospital Care of the American Hospital Association had completed studies indicating that it is not possible to attain an average annual occupancy of 80 per cent in hospitals of less than 200 beds "It may be stated that the hospital needs of a community are met more effectively by five hospitals of 200 beds each than by ten hospitals of 100 beds each Wherever the density of population and the transportation of facilities permit, integration of hospital facilities should provide for hospitals of at least 200 beds each

The Council's recommendation that specialty hospitals, most of which are of less than 200 beds, be integrated into general hospitals is not based on size alone, it was explained, but is primarily dictated by the advances in medical care and the need for

interrelationship between general care and the specialties

The Council suggested a study of admission practices because, "the community quite frequently dictates practices which may increase the need for additional hospital facilities Many hospitals are now called upon to provide a bed at any time the doctor or the patient desires, irrespective of the urgency of the case Hospitals offering such serv ices are compelled to keep a surplus of beds avail able at all times, and this practice only adds to the bed deficit by reducing the number of beds to other Perhaps hospitals should offer some monetary inducement for admissions on a hospitaldeveloped schedule which will help to maintain an even flow of patients"

Recommending that hospitals examine the types of facilities required in their plans to reduce the bed deficit, the Hospital Council said that many patients using general care services should utilize other types of services if adequate facilities were available. Special references were made to convalescent care and patients with long-term illnesses The Bulletin said that Dr Edward M Bernecker, Commissioner of Hospitals, directed a study by the Department of Hospitals for the Hospital Council in April, 1946, which "showed that 22 5 per cent of the general care beds in municipal hospitals were used by patients with long-term illnesses Previous studies had indicated that about 20 per cent of the general care beds in voluntary hospitals were occupied by pa

tients with long-term illnesses" In suggesting that hospitals also consider the types of service required, the Hospital Council said, "The cost of hospital care has increased to such an extent that it is necessary to consider the need for inpatient service as well as the type of hospital facilities which might be required Many of the admissions are for diagnostic evaluation Although ancillary services provided by hospitals are necessary, much of the work could be done without admission to the inpatient service if adequate facilities for the care of ambulant patients were available The Hospital Council endorses this type of facility as a means of improving the medical services available

to the community "More recently evident are the results of studies which have found that many patients using hospital facilities may be cared for at home, and at greatly reduced cost without sacrificing the quality or number of medical services. In particular, patients with long-term illnesses often show marked improvement in health and spirit away from the hospital and in their homes where they have medical supervision and necessary medical, nursing, and housekeeping

services"

# Memorial Hospital Issues Report on Cancer Attack Plans

MEMORIAL Hospital, in New York City, is "attempting to establish something never before done—a cancer university for the advanced study of cancer in man," it was shown in the quadrennial report of the hospital by its president, Reginald G Coombe

Entitled "The Use of Your Money for Cancer."

the report covers the four most momentous years in the history of the hospital. During this period the nation's oldest hospital devoted exclusively to the treatment of cancer and allied diseases has expanded from a single building to the world's largest cancer When completed next year the center will center cover an entire block.

[Continued on page 2614]

facts have been established

- 1 The administration of synthetic Folic Acid to persons with Addisonian pernicious anemia nutritional macrocytic anemia and aprue in relapse is followed by enormous blood regeneration. Strength and vigor return often followed by a rapid gain in weight. There is an increase in red blood cells and hemoglobin
- 2 The hemopoietic response is accompanied by a great improvement in the altered alimentary tract function.
- 3 The response to treatment with Folio Acid parallels that afforded by potent liver extract.

In addition to Folic Acid LICOVITE CAPSULES contain Secondary Liver Fraction, Iron Copper and Vitamins. (See formula on this page.)

[Continued from page 2612]

Stressing the importance of a university for the study of cancer, Dr C P Rhoads, director of Memorial, said that in the space of five years the hospital has arrived in the area of a major educational and scientific institution devoted to all aspects of neo-plastic disease From a simple hospital "it has achieved the function of a graduate school of cancer medicine." Dr Rhoads declared that cancer as a disease receives only transient attention in medical schools. This, he said, requires acceptance by the cancer hospital of its duty to maintain the university standards of intellectual activity

Seventy-eight fellows in surgery, medicine and

research, pathology and radiology are studying at Memorial Center this year, the report says. Doc tors have come to Memorial from all over the United States and twenty-one foreign countries. They have returned to head cancer clinics and hospitals throughout the world, according to the report of Dr

Allen O Whipple, clinical director

The report showed that Memorial served the needs of 113,000 outpatients in 1946, 12,000 more than in the previous year The Strang Prevention Clinic, one of its units, examined 14,000 presumably well persons for first signs of cancer, as compared with

150 in 1940

## Division of Physical Medicine at Rochester Hospital

ESTABLISHMENT at Rochester General Hospital of a division of physical medicine—the first to be incorporated into the services of a Rochester area hospital-was announced in October by Dr Frank C Sutton, director

Head of the new division, whose functions will embrace the practice of one of the most rapidly expanding fields of medicine, is Dr Alfred L Lane, a Cornell Medical School graduate who served with the medical services of the Army Air Forces from

Dr Lane recently completed studies in physical medicine at Bellevue Hospital, New York City, under a fellowship set up under the \$1,100,000 grant made by Bernard M Baruch in 1944 for the adequate development of physical medicine in this country

In one of its major functions as part of a hospital's community service, Dr Lane explained, physical medicine "takes over where surgery and ordinary medical care leaves off" It seeks, he added, to rehabilitate the temporarily disabled—to get the fracture case back on his feet and back to his job more quickly—and to train and condition the per manently disabled to make the maximum use of limited faculties

While the new division, staffed at present by Dr Lane and two therapists, will for the time being operate only for the service of General Hospital patients, Dr Sutton said he can envision future development that will allow for widely encompassing service that will make the division an important source of economic and social benefit to the Roches-

ter community

## State to Operate Onondaga Sanatorium

OVERNOR Thomas E Dewey has announced that the State will take over operation of the 205-

bed, twenty-acre Onondaga County Tuberculosis Sanatorium, effective April 1 This is the first county institution of its kind to be acquired by the State, under provisions of a law enacted in 1946, in a program for eradication of tuberculosis in the State within the next twenty

Onondaga County has operated the sanatorium since 1910, and its acquisition by the State will save the county about \$400,000 a year Governor Dewey said its operation by the State would be integrated in a State-wide master plan for the free care of tuberculosis patients He said it was hoped that the institution would be operated in close cooperation with Syracuse University and its medical school, providing medical teaching and special research facilities

Negotiations are being carried on for the acquistion of several other county tuberculosis hospitals

by the State to serve regional areas

## **NEWS NOTES**

A million-dollar expansion of Veterans Administration mental hygiene clinics in Manhattan, Brooklyn, and the Bronx permitted discontinuance of private psychiatric care for vets in those boroughs effective October 31 Joseph F O'Hearn, acting deputy State administrator of V.A., said the expanded program will provide psychiatric care for vets at half the present annual cost of \$2,000,000

The Rockefeller Foundation and the New York Foundation have awarded \$39,000 to Columbia University for further study on the use of glutamic acid, it was announced. It was stipulated by the foundations that the grants be used for work in brain chemistry carried on by Dr Heinrich Waelsch at the N Y State Psychiatric Institute and Hospital

Genesee Memorial Hospital in Batavia is waiting until "building materials are available and priced within reason" before starting construction of its new 100-bed hospital, according to a report from its board of directory. board of directors

On September 8, the Roslyn Park Hospital marked the first anniversary of opening its doors to the general public and celebrated a year of successful operation

The first clinic for the prevention and detection of cancer to be operated by the New York City Department of Health was opened in October The project has been undertaken on a cooperative basis by the City Health Department, the New York City Car-

#### PROGRAM FOR GENERAL PRACTITIONERS AT A.M.A. CLEVELAND SESSION

In addition to technical and scientific exhibits, a program designed particularly as postgraduate edu cation for general practitioners will be presented at the supplemental session of the American Medical Association in Claveland, Ohio January 5-9 1948

The Council on Scientific Assembly, whose chair man is Dr. Heary R. Viets of Boston, has prepared a program which will include papers, panel discussions, and symposia on many of the topics now most promi nently before members of the medical profession. Among the topics to be covered are peptic ulcar blood dyscrassas (any abnormal composition of the blood), the chronic invalid posthospital care of patients with cancer treatment of the fat and the lean cancer of the prostate the use of BCG vaceme in the prevention of tuberculosis utorms bemorrhage multiple injuries in automobile acci-dents the treatment of pathologic conditions in adolescence the treatment of the healthy and sick diabetic patient, jaundice the Rh factor and the interpretation of x ray films of the cheet.

During the first two days of the session the Council on Industrial Health of the American Medical Association will conduct a program devoted particularly to problems in its field.

Planned for the scientific exhibit is a demonstration of the operation of a diagnostic cancer cline in which viating physicians will be given the opportunity to undergo themselves the routine of such an examination .- A.M.A News October 10 1947

# SUGGESTIONS FOR CONTRIBUTORS TO THE NEW YORK STATE JOURNAL OF MEDICINE

The New York State Journal of Medicine asks its contributors to follow the suggestions listed below in the preparation of their articles. In this way they will greatly facilitate the expeditious publication of the Journal. These suggestions have been devised in order to save correspondence, avoid return of papers for changes, minimize the work of preparation for the printer, and save the high costs of corrections made on galley proof

Size of Articles —It is earnestly desired that scientific articles shall not exceed 6 JOURNAL pages at the outside Longer articles tend to lower reader interest. An average of five or six seems to be the most desirable from this point of view Calculation can readily be made by multiplying the number of double-spaced typewritten manuscript pages by the fraction two-fifths, e.g., twelve manuscript pages will make five Journal pages

Manuscripts —Papers must be typewritten on one side only of white sheets consecutively numbered, and be double spaced with one-inch margins. They should be prepared with great care so as to be typographically correct. All headings, titles, subtitles, and subheadings should be typed flush with the left-hand margin. This is imperative for rapid and accurate composition by the printers

Titles.—The title should be brief and typed in capital letters. The subtitle can be longer and should be typed in caps and lower case letters. Under the title, or subtitle, if there is one, should appear the name of the author and city in which he lives. Directly under his name should be the hospital or institution with which he is affiliated.

Subheadings —Subheadings should be inserted by the author at appropriate intervals

References—It is the unfailing practice of the New York State Journal of Medicine to use specific "references" rather than "bibliography" There should appear in the text reference numbers, typed above and to the right of the word to which there is a reference. A list, consecutively numbered, of these references should follow at the end of the manuscript (Note that spelling in list is same as in text). The arrangement should be as follows and should include all items.

Books—author's surname followed by initials, title of book, edition, location and name of publisher, year of publication, volume, and page number Thus, Osler, W Modern Medicine, 3rd ed, Philadelphia, Lea & Febiger, 1927, vol 5, p 57

b Periodicals—author's surname followed by

month (day if necessary), year of publishing Thus, Leahy, Leon J New York State 1 Med 40 347 (March 1) 1940

到田田

NOTE The JOURNAL does not include title of

Case Reports —Instead of abstracts of hospit histories, authors should write these reports in a narrative style with properly completed sentence. All unimportant details should be deleted with residual general negative statements as fit the case.

Tables —While tables are very useful on linear slides in the reading of papers, they fail of this papers to a large extent in the printed page. For the reason it is urged that they be reduced as much a possible to descriptive language

Illustrations—These should be kept to the mixmum necessary to make clear the points to be registered by the author. In some instances the are imperative to proper understanding, in other they are merely picturesque. The latter can be excluded to good effect, both as to space and them inconsiderable cost.

When illustrations are to be used they choose accompany manuscripts and each should always be referred to in the text, preferably by number. Drawings or graphs should not be larger than 11 X 16 inches, and must be made with jet black him ink on white paper Do not use typewriter for the ring. The smallest lettering on 8 X 10 inch consider the should be no less than 1/2 inch high. Cross-ectia paper (white with black lines) may be used, by should not have more than 4 lines per inch. I finer ruled paper is used, the major division has should be drawn in with black ink, omitting the finer ruled paper can be accepted. Lettering the lines all markings must be large enough to be resided all markings must be large enough to be resided after reduction. Mail rolled or flat, never fall. Photographs should be very distinct and show the black and white contrasts. They must be on given white paper. Avoid round and oval photographs.

white paper Avoid round and oval photograph.
Whenever possible "crop" photographs, i.e., mit
portion that can be excluded when reproduct
Crop marks should be on margin of photographs
Do not run mencil lines through photographs

Do not run pencil lines through photographs
It is important to mark the top of the illustration the back, also its number as referred to in the tell thus, Fig. 1, 2, and the name and address of its author

Legends should be typewritten on one sheet of paper and attached to the illustrations

Yes! And experience is the best teacher in smoking, too!

DURING the wartime cigarette shortage people smoked—and compared—many different brands any brand they could get That s when so many people learned the big differences in cigarette quality. And out of that experience more and more smokers found that

Camels suit them best. As a result, more people are smoking Camels than ever before!

Try Camels! Letyour"T Zone" your taste and throat—tell you why with millions who have tried and compared Camels are the choice of experience."

According to a Nationwide survey

More Doctors smoke **Camels** 

than any other cigarette

Supplied—in 7½ grains with and without Phenobarbital ½ grain, in 5 grains with Potassium Iodide 2 grains and Phenobarbital ½ grain, and in 3½ grains with and without Phenobarbital ½ grain. Capsules not enteric coated, are available in the same potencies, for supplementary medication. The ORIGINAL ENTERIC-COATED TABLET
OF THEOBROMINE SODIUM ACETATE

HESODAT Brewer

to control frequency and severity of attacks in CARDIOVASCULAR AND RENAL DISEASES and to prevent EDEM

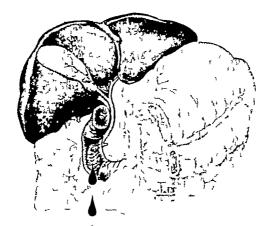

Clinical experience and studies have proven the value of The bromine Sodium Acetate in certain Cardiovascular and Ren Diseases in Angina Pectoris, used adequately, it permits mownt by the individual without developing precordial pain distress. As one of the most effective Xanthine Vasodilators helps increase the available blood supply to the heart and kidnes to increase the efficiency of these organs.

It has also been found an effective aid in treating and prevention. Edema of Cardiac or Renal origin. The enteric coating (especial developed for Thesodate) permits larger doses without the drug contact with the Gastric Mucosa.

# **OBJECT**

# DRAINAGE

In discussing the management of chronic cholecystitis without stones, Albrecht states

"The object of the medical procedure is to assist in draining an infected organ."

The specific hydrocholeretic action of Decholin (chemically pure dehydrocholic acid) accomplishes this purpose.

Bile secretion induced by Decholin is thin and copious, flushing the passages from the liver to the sphincter of Oddi and carrying away infectious and other accumulated material

#### HOW SUPPLIED:

Decholin in 334 gr tablets Boxes of 25 100, 500 and 1000

CAVENDISH PHARMACEUTICAL CORP., 25 West Broadway • New York

# **Pyribenzamine**

High-concentration Elixir Pyribenzamine hydrochloride now provides a second administration form of this proved antihistaminic. Containing 20 mg of Pyribenzamine hydrochloride per 4 cc (teaspoonful), the Elixir has obvious advantages in special cases, notably in infants and children, and in adults who prefer liquid medication

Council Acc

Scored tablets of Pyribenzamine also facilitate small dosage when indicated—the 50 mg tablets are easily broken to provide 25 mg doses.

Council Assessed exercisive subservious is thread of tripelentonies hydrochloride

## grams...drams..and ideals

How much does purity weigh? Where is the scale that can measure quality?

Here at Bristol Laboratories, where we weigh and measure, distil and mix, we take high pride in the thought that there is more in the things we make than can be expressed in grams and drams

Quality and purity are the imponderables which measure the integrity of the pharmaceutical craftsman From this integrity is distilled the confidence with which Bristol products are used by the profession

Increasing thousands of physicians specify BRISTOL
In this fact lies confirmation of our dedication to Quality

## ophthalmological requisite

SODIUM SULFACETIMIDE SOLUTION

30% is a new antibacterial solution for treat
ment and prophylaxis of all the common eye
infections. Possessing a wide range of bacteriostatic
activity, it inhibits numerous pathogens responsible for
ocular infections its efficuer on local application is attributed
to the facts that it is the only sulfonamide salt that can be dissolved in concentration as high as thirty per cent at physiologic
pH 7.4 that it penetrates deeply into ocular thanes that it is virtually
non irritating and that it is not absorbed into the systemic circulation in detectable amounts.

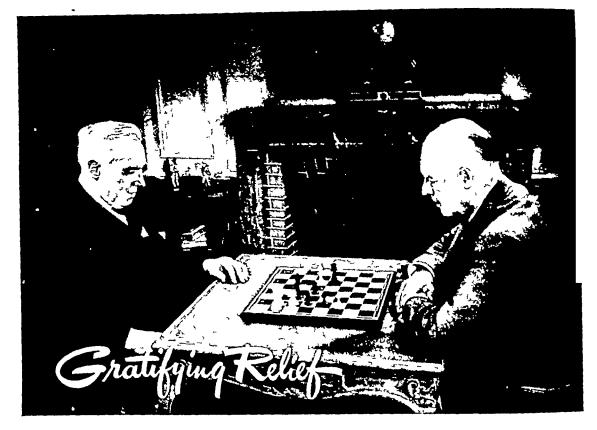

Treatment of eye infections. One or two drops fastilled every two hours or less frequently according to the severity of the infection.

Prophylaxi following folicin body injuries and abrasion to the conjunctiva and corner: One drop instilled three or four times duity

SODIUM SULFACETIMIDE SOLUTION 18% 1 supplied in 15 cc. amber eyedropper battles.

## the characteristic response to Pyridium therapy

The prompt symptomatic relief provided by Pyridium is extremely gratifying to the patient suffering from distressing urmary symptoms such as painful urgent, and frequent urmation nocturia and tenesmus

Pyridium, administered orally in a dosage of 2 tablets tid, will promptly relieve these symptoms in a large percentage of ambulant patients, thereby permitting them to pursue normal activities without undue discomfort

Acting directly on the mucosa of the urogenital tract this important effect of Pyridum is entirely local. It is not associated with or due to systemic sedation or narcotic action

Therapeutic doses of Pyridium may be administered with virtually complete safety through out the course of cystitis pyelonephritis, prostatitis, and urethritis LITERATURE ON REQUEST

CAMP design is dedicated to meeting the physiclogical, surgical and maternity needs of the potient with the utmest in comfort and westhetic appeal. Each specific design is further refined for the variety made necessary by the multiplicity of body builds and figure irregularities. The unique CAMP adjustment feature establishes a firm foundation about the pelvis as an "engineering" base for the distri-bution of regulated support. This makes it easy for the fitter to follow with precision the physician's recommendations for indicated firmness about the pelvis and controlled support of the abdomen, spinal column and gluteal region without pressure compression. 2000000 00000000 ٥ \*\*\*\*\*

## Here's tempting, <u>real meat</u> for patients on soft, smooth diets!

All nutritional statements made in this advertisement are accepted by the Council on Foods and Nutrition of the American Medical Association

### Swift's Diced Meats

For patients on a soft, high protein, low residue diet who can eat meat in a form less fine than Strained Swift's Diced Meats offer an excellent appetizing source of proteins, B vita mins and minerals Swift's Diced Meats are tender, juicy cubes of meat—offer a variety of beef, lamb, pork, veal, liver and heart, five ounces per tin

# Swift's Strained Meats specially prepared—fine enough for tube-feeding

Here s protein rich meat that patients on soft, smooth diets can eat and enjoy! Swift's specially prepared Strained Meats provide an excellent base for a high protein, low residue diet—in a form that is chem ically and physically non irritating. There are six different, highly palatable meats beef lamb, pork, veal, liver and heart. These wholesome meats are readily accepted by most patients, even when normal appetite is impaired.

The individual particles of Swift's Strained Meats are fine enough to pass through the nipple of a nursing bottle—may easily be used in tube feeding. Swift's Strained Meats are prepared with expert care from selected lean U.S. Government Inspected Meats, carefully trimmed of fat and cooked to retain a maximum of the valuable meat nutrients—biologically complete proteins, B vitamins and minerals. Swift's Strained Meats are convenient to use—come ready to heat and serve. Each tin, three and one half ounces

If you wish samples of Swift's Strained and Swift's Diced Meats together with complete information, write Swift & Company, Dept BF, Chicago 9, Ill

## Facts regarding | fluidity

## of PENICILLIN in oil and wax

When penicillin in oil and way is to be used once daily the most import unt consideration is the maintenance of therapeutic blood levels for 24 hours

For easy administration and adequately sustained blood levels, the \_formula must be neither too viscous nor too fluid the penicillin crystals of correct size shape and density the container appropriate to the use intended The following should also be recognized

- 1 I or administration from multiple dose vials, the mixture should be sufficiently fluid to permit easy withdrawal accurate measurement and easy injection
- 2 In all fluid preparations, however the penicillin has a tendency to settle out Unless the container has adequate air space and volume to permit resuspen sion of the settled penicillin by shaking, 24 hour blood levels may not be maintained. Either overdosage or underdosage may result
- 3 When injected from individual-dose cartridges the penicillin in oil and wax suspension should be of slightly thicker consistency. If it is not and the penicillin settles out it cannot be resuspended by shaking, because (a) the volume is too small and (b) the cartridge has no air space
- 4 The slightly heavier type of suspension can be easily injected in accurate dosage with a minimum of discomfort to the patient. It is essentially freeflowing at room temperature and each cartridge contains a full I cc. (300 000 unit) dose which eliminates the need of measuring

In keeping with Squibb policy of making the form of the product appropriate to the use, two forms of Squibb Penicillin G in Oil and Wax are available Each offers the advantages of proper formula and consistency

For easy individual injections in home office and emergency

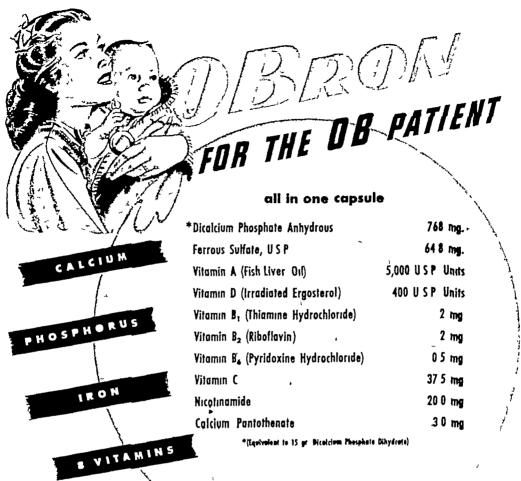

## SQUIBB PENICILLIN G IN OIL AND WAX

## intensive sulfonamide therapy

By combining sulfadiazine and sulfathiazole in a single preparation, the dangers of crystalluria and its troublesome complications are greatly reduced Recent studies\* have shown that the total urine solubility of two sulfonamides is greater than that of a single sulfonamide, since the presence of one exerts little influence upon the solubility of the other Consequently, a greater total quantity of concurrently administered sulfadiazine and sulfathiazole can be dissolved in the urine than of either drug alone

Added renal protection is provided in Aldiazol by the presence of sodium citrate and sodium lactate which alkalinize the urine and further increase sulfonamide solubility

Rapid absorption of Aldiazol is promoted, since the contained sulfadiazine and sulfathiazole are in microcrystalline form. In consequence, higher blood levels are attended in shorter time than with ordinary sulfonamides.

Aldiazol is indicated whenever sulfonamide therapy is called for Because of its liquid form, it is especially useful in children, facilitating accurate dosage as well as administration

Each teaspoonful of Aldiazol contains

Sulfadiazine (microcrystalline) 0 25 Gm Sodium Citrate Sulfathiazole (microcrystalline) 0 25 Gm Sodium Lactate

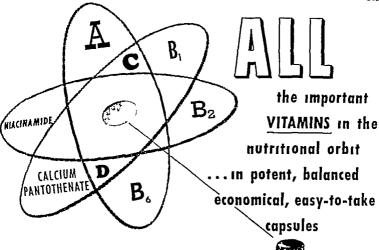

0 50 Gm 0 60 Gm

The weight curves represented above are to be found in actual hospital (name on request) records of 75 consecutive infants fed on Similac for six months or longer. Not once in this entire series of 75 cases was it necessary to change an infant's feeding because of gastro-intestinal upset. Similarly good uniform results are constantly being obtained in the practice of many physicians who prescribe Similac routinely for infants deprived, either wholly or in part, of mother's milk

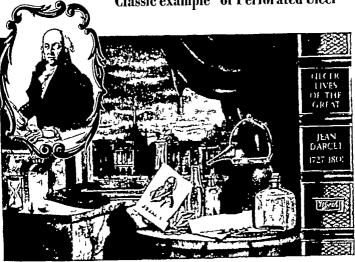

A powdered modified milk product especially prepared for infant feeding, made from tuberculin tested cow s milk (casein modified) from which part of the butter fat has been removed and to which has been added lactose cocoanut oil cocoa butter cornoil and olive oil Each quart of normal dilution Similac contains approximately 400 USP units of Vitamin D and 2500 USP units of Vitamin A as a result of the addition of fish liver oil concentrate

Similar to breast milk

"Classic example" of Perforated Ulcer

JEAN D ARCET, chemist and physicist of 18th century France is cited as one of the first recognized cases of perforated peptic ulcer (in Cruveilhier s Pathological Anatomy of the Human Body)

D Arcet's symptoms appeared only at the age of 72—diarrhea, often with epi gastric or colicky pain. He died suddenly about six months after suffering had be come acute. Autopsy revealed two ulcers

PROSPHALIEL is ideal for drip therapy in bleeding or refractory cases only it is excellent featured as a monarginal as well as a monarginated before. Prosphaljel effectively reduces the acidity of at least five times its own volume of gastric locks and il insertives peptis even in a highly acid medium. Phosphaljel lays a protective costing over the inflamed mecons permitting continuous heading without traiter corresion.

on the lesser curvature of the stomach one with indurated edges and three per forations, the largest of which was 6.7 mm in diameter

If D'Arcet could have had the benefits of today s medical knowledge, with mod ern antacid therapy he might instead be the classic example of a severe case restored to health by intragastric drip treatment.

# Postsurgical healing can be enhanced

In cases with an avitaminosis, wound healing can be accelerated and hospitalization time shortened by preoperative and postoperative administration of Pulvules Becotin with Vitamin C (Vitamin B Complex with Vitamin C, Lilly) Following major surgery there is usually rapid depletion of the water-soluble vitamins. This is particularly true of patients undergoing surgery of the gastro-intestinal tract

Operations of choice allow physicians time to correct deficiencies before surgery. In urgent cases, preoperative and postoperative parenteral administration of Ampoules Betalin Complex' (Vitamin B Complex, Lilly) and Ampoules Cevalin (Ascorbic Acid, Lilly) is indicated.

As soon after surgery as the patient can take oral medication, one or more Pulvules Becotin with Vitamin C may be prescribed until the patient resumes normal activity

### BECOTIN WITH VITAMIN C

One pulvule provides a therapeutic dose of all the known water soluble vitamins

### Plain Talk, II Costs of Professional Services

In our previous editorial, we pointed out the necessity to separate, in discussing total medical service, the costs of professional from those of ancillary services. Rising costs of living necessarily will increase the cost to the public of total medical service. Organized medicine will be blamed for failure to halt these rising costs of total medical service, it will be pointed out that private enterprise in medicine therefore, is incompetent, irrelevant, immaterial, and helpless Ergo, do away with private enterprise and substitute state medicine, eventually nationalize the whole works.

Now, if the costs of professional services are examined separately they will be found to be relatively stable. The professional fee for an office visit in any community is nearly the same as it was, for example, five years ago "The surgeon's fee for an uncomplicated appendectomy is, in a given community, about what it was five years ago Many more people are enjoying the benefits of voluntary prepayment plans for medical and surgical care which indemnify them against at least part of the professional cost of sudden and sometimes catastrophic illness.

Fee schedules, supposedly minimum in nearly all instances but actually maximum, control the cost for professional services rather rigidly in workmen's compensation practice, federal old age assistance, state and county welfare ambulatory care, Veterans Administration service-connected hometown medical service, many industrial employees' mutual aid associations, and the like

These regulatory mechanisms operate to control a vast volume of medical and surgreal fees. Behind the schedules stands a huge and diverse insurance structure, built up gradually through the years and based on experience tables. To some extent the fee schedules in the aggregate exert an influence on the fee levels charged in private medical and surgical enterprise, tending to provide a not necessarily rigid but a steadying influence on any tendency to permit too wide fluctuations. Some abuses naturally exist, in the main, professional fees do not vary greatly over long penods of time, nor do they seem to be excessive for the quality of service rendered

The cost of the other component of total

medical service, the ancillary services, is quite a different matter. Into this component enter the factors of wages, manufacturing and transportation costs, costs of materials, fabrication, technical assistance, taxes, food, power, and the like. Here may be found the principal reasons for increased costs of total medical services. When the public rightly complains of the greater builden of costs, let it be shown clearly that these arise principally from nonprofessional sources—the ancillary services.

It is true that in the course of time the costs of professional education have increased because of the longer required courses of training. With the establishment of more

and more boards in the specialties and the constant elevation of professional standards of education and postgraduate training, nothing else could be anticipated High quality is expensive in medical professional training, as in anything else

The insistence on higher standards has come from within organized medicine itself. Eventually the longer training will probably force a higher rate of professional fees, but this has not yet occurred to any notice able extent.

At the present time careful analysis of the costs of the ancillary services will reveal the source of most of the increased cost to the public of total medical services

## Compulsion Repudiated

What, if any, is the significance to American Medicine of Mr Truman's declaration at his recent press conference of his faith in free enterprise? Of his rejection of controls as implements of the "police state?"

He was pressed to be concrete by questions which went on the assumption that voluntary food saving will not be enough. Asked whether rationing of food would be adopted in the present drive, he answered no, not unless it becomes imperative. Asked whether he regards rationing as an act of the police state, he answered firmly, yes, anything that is compulsory is the police state in operation.

In previous messages to Congress the President, we seem to recollect, has called for a National Health Program. His administration has sought to bring this into action by means of legislation. That legislation has been the Wagner-Murray-Dingell compulsory "health" insurance.

We are unschooled in political deviousness, but how does one reject compulsion as "the police state in operation" with the one hand and support it with the other? Admittedly, the President was speaking of the food situation at his recent press conference, admittedly, he was not speaking to Congress, admittedly, he was not discussing "health" insurance. He was, or seemed to

be, rejecting compulsion as a method of the police state

This action should have great significance for those responsible leaders in American Medicine who have consistently held to the necessity for free enterprise in this field, those leaders who have resisted compulsion as repugnant to the philosophy of a free nation. If, as seems possible, Mr Truman is shedding the tattered remains of the mantle of Elijah, there should be no call for compulsory health insurance in the forth-coming message to the new Congress in 1948. That is, if the President really means what he appears to have said

Assuming that this is so, the obligation of the medical profession to extend and improve its voluntary medical expense indemnity plans becomes greatly increased Relieved of the necessity to divert a considerable portion of its energies and funds to resisting moves toward compulsor "health" insurance legislation, the profession should be able to turn those energies and funds to good account in developing greater efficiency in the delivery of more good medical service to more people at moderate cost

The way seems to be opened for a greater degree of cooperation between organized medicine, government, and business in the public service, by an apparent repudiation

INY Herald Tribune, Oct. 16 1947

of the principle of compulsion, keystone of the "police state"

Every thinking person would like to see a realistic national health program made an accomplished fact. If Mr. Truman and his administration are serious in repudiating the philosophy and methods of the "police state," no serious obstacle seems to stand in the way. The President's message to the next Congress will be awaited with interest as will the legislation designed to implement it.

### Home, Home in the Housing Project

The word HOME used to mean a great deal Until in the large cities, at least, it was debased by the real estate business A man used to own three, possibly four things-his wife, his children, and his home And possibly his self-respect home might have descended to him he came home, tired from the day's work, and mowed his lawn, spaded his garden, watered his flowers much as he might have groaned over the extra tasks, he was contributing to the flowering of his ego French have a phrase for it "Qui fleurit sa maison, fleurit son coeur" "He who makes his house (to) flower makes his heart flower " His own house, his own grounds! They were a little different from anyone else's They were, in a sense, the expression of his individuality And a man needs that sort of thing When, in middle life, his sentimental fancies may start to stray, his home will anchor him when, perhaps, his wife won't He gets fond of it, and if he gets fond enough of it, he will fight for it Not because the newspapers have blown him up to war fever as a child would blow up bubble gum, but because it is something real, something tangible, something that, next to his wife and children, means more to him than anything in the world

Stuy eant Town and Peter Cooper Village are housing projects, two of the greatest testimonials to private enterprise in New York City, consisting of groups of mammoth apartment houses in process of crection between 14th and 23rd Streets east of First Avenue We yield to no one in our admiration of the erectors of these projects, for the successful efforts they have set forth to provide modern housing We have no better alternative to suggest as long as man will continue to live supine under the wretched conditions that present-day "civilization" provides for him. They

are not yet completed, but they have risen recently with incredible speed, and are expected to provide housing for 25,000 people of the lower income group, those unfortunates (I) who labor under the "white collar" stigma. The white collar used to be a mark of distinction. Now it is a yoke. The white collar man is the one for whom nobody cares. He is the bank clerk, the doctor, for instance. He has no unions. The professional man has no Social Security. He has no comfort of class consciousness. He is the owner of nothing but vast personal responsibilities, anxieties, gastric ul cers, and hypertension.

Suppose he is fortunate enough to get an apartment in Stuyvesant Town. It will be in a well-built building. His roof won't leak. His plumbing will be the best. He will have a reasonable amount of fresh air and sunshine. There will be space between the "units' for green grass and playgrounds for his children. We take our hat off to the

various creators of the housing developments But—suppose a son of one of its proud white collar occupants is playing football and gets a slight concussion—nothing of any observable clinical significance, you under stand—or his father, listening to the football scores in the outlying unreconstructed districts, has one beer too many Suppose neither of them can remember whether they live in Unit B, Floor 13, Apt 1C, or is it Unit Z, Floor 7, Apt. 4?

Imagine the plight of those poor deracin ated blind moles, groping their way from one identical apartment to another. The height of the buildings prevents them even from being able to take a sight on the North Star to orient themselves by means of the heavenly bodies. They were not born with the instancts that the lowliest bee has, to guide him home to his individual cell in the racial honeycomb

We look forward with some uneasiness to the antics of the first generation of children that is to spring from the uniform, standardized, sanitary, up-to-date, healthy, sunny, grass-lawned, playgounded housing units

Aren't there going to be lots of gangsters, exhibitionists, and others of their ilk who will flourish on such safe, sanitary, socially conscious soil—no pun intended—just because there is something in their perfectly normal natures that makes them want—for God's sake—to be a little different?

We end by presenting our readers with the smallest crumb of comfort we can think of The atom bomb may make the question of whether or not we live in a home or in a housing project of no importance whatever

But in the meantime while we, like the Millerites, await the end of the world, doctors might do well to consider the vagaries of conduct they will encounter caused by nothing more abnormal than the desire of the normal human being to exhibit a little individuality of his own

### Current Editorial Comment

State Medicine in Practice The JA-MA reports¹ on the results of a state medical service in operation for some time in New Zealand It will be remembered that on May 14, 1947,² Mr Isadore Falk of the Bureau of Research and Statistics in the Social Security Board urged that one Jacob Fisher, a member of Mr Falk's staff, be sent to New Zealand at government expense to study compulsory health insurance programs and activities in that nation ³ Mr Fisher could profit by the report of the London correspondent of the AMA who writes as follows

Sir Ernest Graham-Little, dermatologist, member of Parliament, and well known as a writer on medical politics, shows in the Daily Telegraph the results of a state medical service in New Zealand, where it was instituted by the labor government and has been in operation for ten years Since the war the system has been fully reviewed in the House of Representatives, and almost universal dissatisfaction with it has been expressed. The complaint was made that it is a common practice for physicians operating the health service to undertake treatment of an impossible number of patients and to push them through at the rate of one every five minutes. If the diagnosis is not conclusive the patients are sent to the public hospitals, which are consequently filled with trivial cases, crowding out serious cases The prime minister, who had a large part in founding the scheme, was so shaken by the evidence that he said "If patients are being treated like sheep passing through a dip, without proper overhaul, the matter should be investigated" In a subsequent debate the minister of health admitted that the abuses of the system were such that the government must seriously consider altering it

Other criticisms have been made For instance, it is contended that, while state doctors draw extravagant incomes from the social security fund, it is extremely difficult to secure any medical attention outside business hours or during the week end. There is said to be a definite falling off in the standard of medical practice, from both the ethical and the clinical points of view. The absence of incentive to undertake the prolonged training to qualify for the status of specialist has resulted in a serious dearth of skilled physicians and surgeons and consequent discouragement of both medical research and postgraduate study

The cost of the security benefits has mounted sharply During the year ending March 1 it was \$139,000,000 against \$83,000,000 for the previous year. The drug bill increased from \$2,250,000 in 1943 to \$5,700,000 in 1947 and the medical benefits from \$4,000,000 to \$7,000,000 in the same period.

It is to be recalled that Life Magazine, in discussing editorially "The Public's Health," a review of the current proposals for the British brand of State medicine (National Health Service), remarks that

Vol 135 No 7 Oct. 18 1947 p 447
 80th Congress 1st Session, House Report, No 786 p 7
 New York State J Med , 47, 1976 (Oct. 1) 1947

<sup>&#</sup>x27;Sept. 1, 1947, p 28

"New Zealand has found that under a system of socialized medicine the tendency is for the doctor to encourage unnecessary consultations to collect more capitation charges And some patients, freed of direct payment, tend to malingering and hypochondma

The whole picture is a sad one tably the public which must pay for the mevitable heavy costs of such schemes with their deteriorated, diluted, superficial, medical lip service, "patients being treated like sheep passing through a dip," will probably have to learn the facts the hard way

The Hog in the House A correspondent writes, via the Secretary of the Medical Society of the State of New York, a sorry tale of human misunderstanding doctor correspondent engaged a locum ten ens, Dr A, under the following circumstances

Answering an advertisement in the New YORK STATE JOURNAL OF MEDICINE, I explained to Dr \ that I had worked hard through thirty years, active in one war and overworked in the second, and wanted a long rest and also wanted an associate to take over largely my medical work and, ultimately, perhaps very soon, my house and office He came here with that understanding was introduced to my pa tients without reserve as "the doctor who would be associated with me on my return "

To make a long and unpleasant story short, before my return he bought and advertised the opening of his own office and has stayed

right here

He had the use of my home and office histories and car-the latter incidentally left

practically useless

I fully realize that according to law one should have a written agreement or contract, there are many unwritten rules of conduct especially in medicine, that are recognized as lived up to daily by all honomble physicians

In our own defense we can only say that we are interested and eager to offer professional opportunities to our colleagues who are desperately in need of them doctor himself admits that he should have had a guarantee in writing from his locum tenens that he would not do any of the things he subsequently did We believe that he has not necessarily cut the legal ground from under himself, and has a basis for suing the cuckoo in his nest if he can convince a jury that a verbal contract was made

Acknowledge it or not, as you choose there are some "cuckoos" in any profession Indeed, with the extraordinary opportunities in medicine for charlatanry, drug peddling euthanasia, etc., we frequently congratulate ourselves that the profession is as clean as it is

But even so, it is not nearly so pure as it

might be

The medical profession has proudly proclaimed its ability to police itself, on the ground, we presume, that its ranks were filled by citizens slightly above the average grade of morality

Here is a splendid opportunity for it to show what it can do The community in which the quoted incident took place is a comparatively small one The local newspaper printed an extensive announcement of the arrival of the 'cuckoo' in its com munity If the county medical society held a special meeting for the purpose and passed a resolution condemning the conduct of Dr A, the newspaper might be persuaded to print that, too

Small, and even larger communities, have achieved results by "putting the freeze" on Dr X will undoubtundestrable citizens edly attempt to justify himself by pointing to his unselfish service in the last World How about his employer's service in War World War I, and his overwork at home in

World War II?

Here is the case of a reputable member of the medical profession who invited a colleague-literally-into his home, entrusted him gratuitously with every professional neapon that he possessed, because he had so much trust in the honor of a member of his profession that it never occurred to him to insist upon a legal written contract And, returned from his "vacation," found himself, after many years of service, betrayed

It is admitted that the law provides no What can the medical profesmon and the decent sentiment of a com-

munity do? Let's see

New Departure in Infant Feeding makes sense to us, however, the Children's Bureau might choose to view it with alarm as another manifestation of private initiative or individual enterprise or something

The 'self-regulating" method of feeding habies 'is consonant with the democratic society of which the children are a part and with basic physiologic laws,' say two mem

bers of the Section on Pediatrics of the Mayo Clinic, Rochester, Minnesota, in the October 11 issue of The Journal of the American Medical Association

The writers, C Anderson Aldrich, M D, who is director of the Rochester Child Health Project, and Edith S Hewitt, M D, who is a member of the same project, base their conclusion on experience with 668 infants whose mothers let them eat as much or as little as they wanted whenever they seemed to be hungry, up to their first birthdays. These comprise all the Rochester babies born in 1944 and 1945 for whom one-year summaries were completed in the well-child clinics of the Rochester Child Health Project, which supervises mothers of all economic groups in feeding and caring for their babies after dismissal from the hospital

The mothers were told what kinds of food to offer their babies, but otherwise their chief role was to supply the food and to discover their offsprings' individual rhythm of eating. They were instructed to offer changes in the types of food and the methods of feeding whenever the babies showed that they were able to swallow semisolids or to chew solids, or began to reach for cup and spoon. But bottle feeding was also to be continued until the new methods were firmly established, or until the baby began to reject the bottle.

The infants were even allowed a good deal of freedom in choosing between foods which have similar nutritional value, such as the different vegetables and fruits. Mothers were advised to give, at most of the feedings, types of food which the babies preferred rather than to try to broaden the menu in spite of the babies' resistance.

The attained heights and weights of the babies at one year of age compared favorably with the generally accepted standards, 29 4 inches and 21 8 pounds

A group of 100 infants were also studied more intensively in order to determine the feeding interval they preferred Forty of them were breast fed for several months, and 60 were artificially fed

At one year of age 91 per cent of the babies had automatically placed themselves on a regimen of three meals a day, the doctors noted that "in the early weeks of life a large majority of the babies chose an interval of less than four hours"

"Whereas a rigidly prescribed routine of feeding intervals could meet the requirements of the average baby," the doctors point out, "it could not possibly fit the needs of those whose natural rhythm deviated greatly from such averages. Both the precocious babies, who tended to lengthen their intervals early in life, and the slower-to-change babies would be out of step."

We commend the authors of this research as well for the sound philosophic concept on which it was founded as for their personal hardihood in provoking the probable feral wrath and indignation of 2,672 grandparents

It must also be realized that the institution of such "liberal" procedures will cause havoc in hospital nurseries and with the timetable methods taught to mothers by our pediatric conferes However, time will tell

Editor Trustee It is of interest to note that a fellow editor of a state society journal, namely that of North Carolina, has been selected to fill the unexpired term of Dr Charles A Roberts, who died some months ago Dr Wingate Johnson has occupied a prominent place, in addition to his editorial accomplishments, in the field of internal medicine He is the author of numerous contributions to the literature, he has been active in the American Medical Association House of Delegates, he has devoted himself more recently to raising the status of the general practitioner Our good wishes go forward to him in his new office as a member of the Board of Trustees of the  ${f A}$   ${f M}$   ${f A}$

Survey of Psychiatric Aspects

JOHN E SCARFF, MD, and LOTHAR B KALINOWSKY MD New York City

(From the Neurological Institute)

THE neurosurgical approach to mental illness has reached the stage where it seems justified to give a survey on the subject before a general medical meeting Limited to cases where shock treatment has failed or is not indicated the brain operation represents a valuable addition to our therapeutic armamentarium in many otherwise maccessible cases Careful selection of cases is imperative, and it can be hoped that with better evaluation of individual patients, rather than through large statistics, a reliable preoperative prognosis will be possible in most cases. Close cooperation between neurosurgeon and psychiatrist is a point of great importance as already demonstrated by the originators of the method of Monis and Lima in 1936 and later by the Ameri can pioneers, Freeman and Watts. 1.3 The authors of the present paper followed this pattern closely, one of them (J E S ) limits himself to the neurosurgical problems which particularly regarding the fibers to be cut, are far from being settled, while the other (L. B K) selects and evaluates the material psychiatrically, based on experience with the shock treatments, and tries to integrate the surgical approach with the less drastic somatic treatments at our disposal Some of the authors' own impressions are incorporated in the present paper, which, however, is meant chiefly as a survey on the present status of this new method.

Prefrontal lobotomy or, as it is sometimes called leukotomy, originally was based on the idea that the frontal lobes produced dominant chnical manifestations in the psychoses The intended breaking up of "faulty cellular connec-Watts in their monograph on "psychosurgery, which gives a complete survey on all the theoretical and practical aspects, promote the theory that not only sensations as is generally accepted

tions,' particularly in the frontal lobes, had to be performed bilaterally because each frontal lobe can be substituted by the other Freeman and

but also ideas receive their affective charge in the thalamus by interrupting the connections between the nucleus medialis dorsalis of the thals mus and the frontal lobe, the affective response to certain psychotic experiences or neurotic symptoms is reduced. We feel that this concept is borne out by those patients in whom abnormal ideas or hallucinations continue to be present but no longer worry the patient. It is more difficult to explain those patients in whom the symptoms disappear entirely. As a working hypothesis in establishing indications and prognosis in individ ual cases Freeman and Watt s hypothesis has proved itself to be extremely valuable to us

Prefrontal lobotomy is performed by transecting the white matter of the frontal lobes bilater ally in the plane of the coronal suture This keeps the cut in front of the lateral ventricles question of which part of the connections between frontal lobes and thalamus should be cut to assure clinical results is still disputed and Watts emphasize the importance of cutting the fibers near the middle line. Hoffstatter et al.4 cut exclusively the orbital areas in order to diminish the side-effects of the operation How unsettled this question of the optimal arte of the cut still is was demonstrated by neuropathologic studies of Meyer and Beck, who showed in seven autopsies that incomplete severance of the thalamofrontal fibers in quite different planes gave equally good clinical results. In some instances with unsatisfactory outcome reoperation was performed and a further cut of fibers achieved the desired result.

The technic developed and standardised by Freeman and Watts is now generally in use throughout the country These workers make a small trephine opening at a point 3 cm. behind the lateral rim of the orbit and 6 cm. above the sygoma Through a small opening here a long narrow blunt dissector is mserted directly into the brain in the plane of the coronal suture and is awang downward until the floor of the anterior force is reached, then carried along the floor as far laterally as the opening will permit. It is

Prescated at the 141st Annual Meeting of the Medical Society of the State of New York, Buffalo Section on Neurology and Psychiatry May 9 1947

then reinserted and swung upward and along the convexity of the brain. The fibers of the upper and lower parts are then severed on both sides

This method recommends itself for its technical simplicity. However, it is open to the objection, theoretical and real, that blood vessels may be torn open with considerable hemorrhage into the brain which is unrecognized at the time and uncontrolled, and this factor in turn may not only increase the postoperative morbidity and even to some extent the mortality, but it also makes unpredictable anatomic and pathologic changes in the brain, which are undeterminable

#### Technic

To offset these objections, the authors have been performing the section of white matter under direct vision, as also recommended by Lyerle 6 Sodium pentothal intravenously in conjunction with local infiltration of the scalp is the anesthetic employed A coronal incision of the scalp is made which crosses the midline just posterior to the coronal suture at a point approximately 14 cm behind the nasion, and passes laterally and slightly forward toward the lateral rim of the orbit, but ending 2 to 3 cm short of that point The anterior flap of scalp is then reflected forward exposing the central two thirds of the coronal suture and the area of the skull immediately before and behind it A small osteoplastic flap is then turned up on each side of the midline, "hinged" on the temporal muscle and extending medially to within about 2 cm of the These flaps "straddle" the coronal suture, and he about two thirds in front of the coronal suture and one third behind it

The dura is then opened and a short incision, approximately 2.5 cm in length, is made through a suitable area of cortex in the line of the coronal suture or immediately anterior to it. The edges of the incision are held apart with a narrow spatula applied to the anterior wall. The position of the anterior tip of the ventricle is determined with a ventricular needle, thereby establishing a plane for section of white matter, which is essentially that of the coronal suture but which passes just anterior to the tip of the ventricle

The actual "section" is made by gently sweeping the tip of a very fine metallic sucker tip in the plane desired. The white matter is easily divided

by the metallic tip and the field is kept dry at all times by the suction. As vessels appear in the field they are first cauterized or clipped, and then divided. Vessels which are accidentally divided are easily picked up and cauterized or clipped. Proceeding in this manner, bleeding is either prevented or immediately controlled, and the entire section proceeds in a surgical dry field under direct vision at all times.

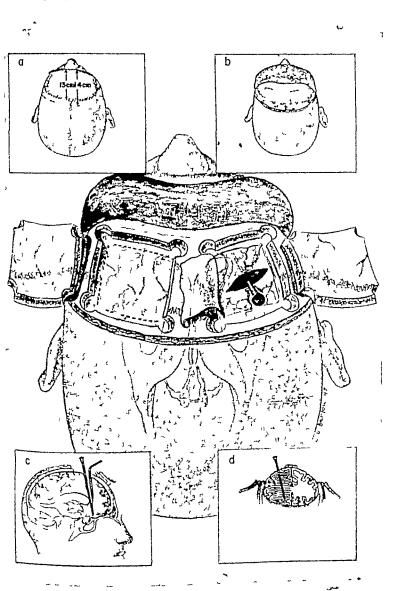

The section is extended radially within the selected plane until gray matter of the medial, lateral, and inferior surfaces of the frontal lobe is reached, and to a line 15 cm from the floor of the frontal fossa, as measured by a ventricular needle Silver clips are placed at intervals around the periphery of the "section," for subsequent x-ray reference. If the ventricle is opened accidentally, no apparential effect results, and no special management is required. The dura is then resutured, the bone flap replaced, and the scalp closed

Leukotomy under direct vision assures a mini mal operative mortality and postoperative morbidity Little change, if any, occurs to the patient's pulse rate or blood pressure during the The anesthetist's chart is usually "flat" Within a few hours after operation, the patients are usually responsive and fairly well oriented The following day, as a rule, they take their normal diet with apparent pleasure this time most of them are quite alert and communicative They begin looking at newspapers or magazines and start "reading" shortly thereafter The postoperative temperature is rarely elevated for more than twenty-four or forty-eight hours Stitches are removed on the third postoperative day and the patient, as a rule, is out of bed by the These patients mingle sixth or seventh day with the other surgical patients, although, of course, they are always in the company of a nurse or attendant They are usually discharged from the hospital within ten to fourteen days after the operation

# Postoperative Course

The first days or weeks after the operation may be disconcerting, but it cannot be emphasized sufficiently that nothing we see during this period gives any clue as to the final outcome of the case. Much prejudice against the operation re-

Fig 1 (see next page) Prefrontal lobotoms —technic used by authors A coronal incision is used, placed just behind the coronal suture (a) The scalp is reflected off the frontal bones (b) Small osteoplastic flaps straddling the coronal suture are turned up on each side of the midline (center) A small incision is made in the cortex parallel to, and slightly anterior to, the coronal suture (center) The anterior poles of the ventricles are located by means of a ventricular needle (center). The plane of the leukotomy corresponds approximately to the plane of the coronal suture, but is established far enough forward to miss the ventricles (c). The base of this plane falls approximately at the line of the sphenoid ridges (c). The white matter within this plane is divided with a fine metallic sucker until the gray matter is everywhere encountered at the periphery of the section (d).

sults from the fact that those having no personal expenence fail to distinguish between transitory, immediate postoperative manifestations, and permanent effects The much discussed regression to the behavior of a child characterizes the transitory postoperative state while the actual loss of higher psychologic functions is minimal Deep confusion, rare in our experience, obviously is not necessary for a good result

Numerous postoperative changes have been Rather frequent is an increase of described temperature which may reach 102 F, and last for several days. After the operation the patients develop an enormous appetite and eat indiscriminately everything offered to them Gain of weight is almost constant and sometimes reaches a degree which is better explained by endocrine dysfunction than by the increased intake of food Changes in autonomic regulations are frequent Focal neurologic signs, mentioned by Moniz and Lima, were hardly seen by other workers It is only during the later postoperative period that convulsions occur, Fleming, in a review, reported their occurrence in 64 per cent, but they are often a transient occurrence 7

Inertia is the leading symptom for days and weeks. Even if the patient is perfectly clear he shows no spontaneity When spoken to, his answers come quickly and without much thought He does not care much about his answers He is indifferent and inattentive He will soon look at books, but has no understanding of what he reads Repetitiousness and playfulness are other characteristics of this period His productions in writing or drawing are primitive, like those of a

The most disturbing feature for the onlooker is that the patient is entirely unconcerned about everything This is best emphasized by the way he reacts to the frequent, but by no means constant, symptom of incontinence of urine and, sometimes, of feces Incontinence of urine at night is often seen for several weeks, although during the daytime the patient soon learns to control his excretions The mental state hardly explains the incontinence as such, but the patient's complete lack of humiliation for his incontinence makes re-education more difficult

As to the symptoms for which the patient was operated upon, the same is true as for the sidewhatever we see during the first few weeks is not indicative of the future develop-Certain symptoms may still continue for some time, but they have a different meaning A patient who before the operation tried to scratch out her own and other peoples' eyes still tried to touch eyes for several days after the operation, but without any aggressive tendency and more playfully Serious symptoms often change into

harmless habits The same is true for compulsive acts which the patient may still perform. he does not even fight his compulsions which become unimportant to him and which are slowly given up Most complaints are forgotten, and ag gressive and self-destructive tendencies are gone.

Care of the patient during those first postoperstive weeks is an important part of the planning of the operation We keep the patient at the Neurological Institute for eight to twelve days only, but request that the family make arrangements for a two months' stay in a private samtarium where one of us supervises his re-education following his discharge from the Institute The symptoms which must be overcome during this period are mertia, tactlessness, lack of inhibit tions, and other "organic" symptoms It is not easy to determine how much active re-education really accomplishes The patient is usually will ing and open to suggestion, but he does not take The disturbing admonitions very seriously symptoms improve slowly by themselves let hospitalization of two months should be insisted upon One patient against our advice was taken home prematurely by the highly pleased relatives, he took alcohol to which he was obviously intol erant like any other "brain-injured" patient, became threatening, and had to be taken to an institution He is now fully recovered There is no doubt that careful planning is extremely important for a fully successful prefrontal lobotom), and possibilities of rehabilitation should be discussed by the psychiatrist and with the help of social workers even before the operation It should be stressed, however, that if competent care in a private hospital is not feasible, the pa tient should be kept for at least two months in a public institution rather than taken home, because he needs constant supervision for his own protection

Lasting side-effects seem to be fewer than originally thought They are difficult to judge m schizophrenics, because the organic symptoms after a brain operation and the defect state of a chronic schizophrenic have been symptoms in The most important of them is emotional duliness Lack of tact and other signs of impaired feeling for finer distinctions, often seen in operated patients, also can be observed in schi Psychoneurotics after zophrenic remissions operation are better test objects for judging the side-effects of the operation, and it is striking how few of the much discussed after-effects of prefrontal lobotomy are present in the majority of cases Slowness of performance is often com pensated by greater attentiveness, because the patient is less preoccupied than before Impair ment in the emotional sphere can be assessed

less easily by tests

Is mtelligence impaired after prefrontal lobotomy? Most workers agree that with the usual testing of psychometric intelligence the LQ remains within preoperative figures. It has been realized for a long time, however, that the IQ gives a picture of only certain abilities and does not include all parts of what Halstead called 'biological intelligence.' Special intelligence tests decised by Halstead show that only after removal of cortical tissue of both frontal lobes is there any impairment, while these tests after prefrontal lobotomy, with only white matter being cit, do not show any significant impairment of intelligence.

There is frequently an increase in intellectual shilties following prefrontal lobotomy. This is easily explained in those patients in whom the synhotic state or neurotic preoccupation had prevented the patient from using fully what intelligence he had. According to I recention and Watts it is not the intelligence as measurable by tests which is impaired but the functions of foresight and insight, a Viore work is needed particularly with examinations regarding impairment of "abstract attitude" (Goldstein). The practical conclusion however, can be made that fear of intellectual deterioration should not withhold the operation from any patient who is afflicted with a disabling psychiatric condition.

#### Indications

Prefrontal lobotomy is not specific for any single psychiatric condition. It is primarily a method to remove certain manifestations of psy chaine conditions. Rees lists as the symptoms most reliably removed anxiety groundless fears about the future, suicidal tendencies, self mutila tion, states of tension, destructiveness, and attacks of uncontrollable violence . Patients without emotional response to their symptoms will not benefit from the operation The success, actording to Freeman and Watts, can be anticipated in proportion to the manifestations of emotional tension 1 It is obvious from these statements that patients with the most varying psychi atric disorders can be benefited A thorough Psychiatric evaluation of each individual case is necessary to determine the desirability of the operation.

The two types of patients primarily suitable for prefrontal lobotomy are schizophrenics refractory to shock therapies, and obsessive-compulsive neurotics who remain uninfluenced by hyphotherapy. A number of other psychiatric syndromes present less definite indications

Schnophrenta.—The scriousness of the schnophrente psychosis and the great number of hopeless chronic cases in this group explain why the decision to operate on the brain was more readily

made in this than in any other group It should be emphasized, however that it is a mistake to delay the operation until the patient is hopelessly deteriorated Although we strictly limit the operation to schizophrenics who have failed under all available methods of shock therapy it is ad visable to operate as early as possible after the shock treatments have failed. It is striking to see how different is the outcome after a prefrontal lobotomy in a schizophrenic psychosis of one or two years' duration compared to patients who have been ill for five or ten years. Emotional duliness, loss of mutiative and certain thinking disorders are irreversible changes in a chronic schizophrenic psychosis and cannot be expected to disappear, and it is a mistake to blame the surgeon for symptoms which are caused by the longstanding psychosis rather than by the surgical intervention

It is obvious that early operation will largely diminish residual symptoms.

It is still unknown how far the basic schuzophrenic process is touched by the operation, but it is underiable that most of the disturbing symptoms can be removed Violent behavior, suicidal and homicidal tendencies and destructiveness disappear in the majority of cases. Hallucinations and delusions often continue to be present but the patient no longer reacts to them. The types of schizophrenics usually uninfluenced are emotionally empty hebephrenics without "active" symptoms, and withdrawn catatonics. We do not accept these groups for the operation The statement by Freeman and Watts that the emotional responsiveness is the most important prognostic criterion for prefrontal lobotomy was found to be extremely valuable in our experience

Social considerations are of great importance. It is of questionable value to change an institutional patient into a mental invalid living at home for whom the family has to care for years to come. Yet there are instances where the relatives have shown by constant unsuccessful attempts to take the patient home that they are willing to bear any sacrifice as long as the patient is with them. In such cases even a deteriorated patient may be accepted for the operation.

The statistical evaluation of prefrontal lobotomy in schizophrenia encounters even more difficulties than that of the shock therapies. Attempts should be made in statistics to correlate duration of illness and results. Stricter selection of cases makes for higher improvement rates. On the other hand, the results in mental institutions, which mostly operate on deteriorated disturbed patients, are statistically poor, although it may be a highly gratifying result when a chromically disturbed bomicidal patient, who has been constantly in restmint changes into a harmless

and pleasant, though still dull and mactive, institutional patient

It has been rightly stressed by most workers that no patients are made worse by the operation, and it is regrettable that physicians not acquainted with the method often warn against the operation with just this statement. The vast majority of cases improve after operation, and in those where even violent behavior and destructiveness remain uninfluenced, it must be assumed that not sufficient fibers were cut, and reoperation should improve the result

In conclusion it can be said that in the fight against deleterious effects of schizophrenia prefrontal lobotomy is an extremely valuable weapon when it is combined properly with other available somatic methods. Results will be most satisfactory when the operation follows without further delay the unsuccessful application of electric shock therapy, insulin therapy, and combined shock methods. A clear plan for treatment should be outlined as soon as the diagnosis of schizophrenia has been made, and then followed through systematically in each individual case.

Obsessive-Compulaive and Other Neuroses ---There is increasing evidence that disabling psychoneurotic syndromes represent an excellent field for prefrontal lobotomy The most recent statistic by Freeman and Watts shows that in obsessive states all patients showed good or fair results, although in some this result was achieved only after a second operation Most workers agree with this favorable impression It is obvious that physicians will be more reluctant to operate on the brain of an intellectually unimpaired psychoneurotic than in a schizophrenic, and therefore, fewer figures are available for this group sults are particularly good in severe incapacitated obsessive-compulsives What has been said about adequate shock therapy in schizophrenia prior to the operation should be emphasized regarding intensive psychotherapy in the psychoneuroses The danger that delay of the operation might interfere with results does not exist in this group and it will depend on the judgment of the psychiatrist when psychologic methods should be replaced by surgery It is surprising to see how few sideeffects after the operation are recognizable in most psychoneurotics compared to schizophren-Some loss of initiative, affect, and sense of finer distinctions occasionally worry the relatives, but they do not interfere with the patient's happiness compared with the constant suffering prior to the operation, and complete social readaptation is frequent

Other Conditions—Little experience is available in other psychiatric conditions with the exception of the involutional psychoses. Pure involutional melancholia responds to electric shock

therapy in practically all cases, and it is our one. ion that surgery should be limited to the rare failures under shock therapy The reviews by Walker, 10 and Brody and Moore 11 show that results are contradictory The same can be said about the manic-depressive psychoses where little information is available as to whether or not future episodes of this recurrent disease can be prevented The paranoid type of involutional psychosis usually was not separated from involvtional melancholia in available statistics. The paranoid group, more closely related to schize phrema than to the effective disorders, is a promusing field for prefrontal lobotomy, all the more as these patients respond poorly to shock thempy The strong emotional response to their delusions, which brings them into conflict with somety, can be removed by the operation even if some of the delusional ideas persist. These patients, who are seldom deteriorated, often make an excellent social adjustment after the operation

Other psychiatric disorders may become subject to the operation in individual cases Tenson or depressive mood were reasons for operating on alcoholics, irritability and violence led to surgery Reports on operations in psychoin epileptics pathic personalities with and without criminal Neurologic conditendencies are controversial tions such as parkinsonism when complicated with mental symptoms were operated upon with Finally, Freeman and Watts varying results operated successfully on various patients with intractable pain, and Van Wagenen saw rebel from pain in the case of a phantom limb 12

# Summary

The neurosurgical procedure of prefrontal lobotomy is an important advance in the treatment of certain psychiatric cases which have failed under other forms of treatment

The danger of the operation is small and can be lessened further by operating under direct vision, thus permitting full control of bleeding

A technic for prefrontal lobotomy under direct vision is described

Permanent intellectual impairment is absent in psychometric tests. Spontaneity, future planning, and emotional response show some impairment which is not such as to be considered a senous objection in the type of cases for which the operation should be reserved.

Schizophrenics who have failed under adequate shock therapy are good prospects as long as strong emotional response to their psychotic experiences is still present. Duration of illness is an important factor for the outcome and the operation should be performed as soon as possible after all available shock treatments, adequately applied, have failed

Obessive-compulsive patients and some other severe neurotics who were not responsive to in tense psychotherapy returned to useful and pleasant lives.

Other psychiatric disorders may also be suit shie for the symptomatic effects of the operation

Reports of individual cases rather than large statistics will add to our understanding of the possibilities of prefrontal lobotomy

#### Discussion

Dr Paul Hoch, New York City -I believe at the present stage of our knowledge it will be necessary to agree on a basic principle namely in which psychiatric cases this procedure should be advocated indiscriminate use of frontal lobotomy would discredit this method quickly Therefore, it will be necessary to define rather sharply where this operation should be used. This naturally should not prevent experimentation with the operation but experimentation done for research purposes should not be confused with its use generally We believe that, at present, it should be employed only on chronically ill patients, in other words, in individu als who have been mentally sick for several years In addition, it is necessary to request that these patients receive all other available treatments before operation is performed. In psychotic patients they should have been exposed to insulin and electric shock therapy In neurotic patients they should have received competent psychotherapy of an adequate amount before the case was judged ready for operation. It seems to me that prefrontal lobotomy is not a therapy for certain diagnostic entegories like manie-depressive psychosis or schlzophrenia, but a procedure especially helpful in cases where phobic anxiety or obsessivecompulsive symptomatology dominates the clinical picture. In addition it can be used in very disturbed and destructive chronic schizophrenic patients where the operation will alter the attitude to their environment, causing them to become more amiable and complacent, even though in these patients a change in the general psychotic structure cannot be expected. Chronic depressions which have resisted shock therapy are also suitable for frontal lobotomy We are most impressed by the effects of prefrontal lobotomy in some well preserved schizophrenics with phobic and obsessivecompulsive symptomatology and in cases of long standing, obscessive-compulsive neurosis where sometimes the results exceed anything seen until now with other therapies.

In selecting the patients for operation, it is also important to pay attention to their profession. Persoms who did a high caliber intellectual work usually suffer from the operation, and I believe that persons with outstanding intellects should be operated upon only if the sickness they have is so incapacitating that their intellectual capacities however outstanding are not used due to their illness. This brings us to the psychologic observations made on cases with frontal lobotomy If you scan over the psychologic tests they show very little, and actually the impression is gained that the person who undergoes frontal lobotomy shows no intellectual impair ment Clinical observations, however indicate that even though gross intellect is not impaired, fine intellectual functioning, like planning foresight, as it was pointed out by Freeman and Watts and many other subtle functions of the psyche are sufficiently modified in some individuals to be considered crip-Our psychologic tests employed today pling simply are not sufficient to show these changes and most likely tests will have to be devised which will demonstrate these fine psychic alterations fore because the usual psychologic tests indicate very little, it is not permissible to say that important operations of the intellectual functioning of the pationt are not impaired

Frontal lobotomy is most likely a quantitative approach in the treatment of mental disorders Generally speaking, this treatment leaves the basis of the mental disease unchanged but it reduces the impact of the disorder on the patient. For instance, hallucinations obsessive ideas or fears are noticed by the patients after the operation but they say that they are not dominated by them as before and that they gradually fade away How this diminution of the emotional pitch behind the patients symptoms is accomplished and, especially why sometimes intricate obsessive and phobic symptomstology disappears completely is not known and a great deal of further research will be necessary to demonstrate how this is accomplished. Frontal lobotomy is not only an important tool in the treatment of chronic mental disorders but I believe also it will be of great theoretic importance to show how quantitative factors and not only qualitative ones which are supposedly better known, enter into the picture of mental disease.

# THE EFFECTS OF INFLUENZAL MENINGITIS ON THE NERVOUS SYSTEM

RAYMOND D ADAMS, MD, and CHARLES S KUBIK, MD, Boston, Massachusetts

(From the Department of Neurology, Harvard Medical School, the Neurological Unit, Boston City Hospital, and the Department of Neurology, Massachusetts General Hospital)

RECENT years have witnessed several important additions to our knowledge of influenzal meningitis, especially as regards therapy. Newer antibiotic substances promise to reduce significantly the mortality rate from this disease and it will follow inevitably that the amount of material available for pathologic study will be limited hereafter. The time seems ripe, therefore, to examine in detail the lesions of the nervous system. It is only by fully apprehending their nature and extent that the symptomatology, the therapeutic failures, and the crippling sequelae can be viewed in their proper relationship.

Two or three characteristic cases will illustrate the problems which will confront physicians as a consequence of the introduction of new methods of therapy

# Case Reports

Case 1—(BCH A46-85) The patient was a 1-year-old girl who three weeks before admission began to "cut teeth" and seemed less active although she ate well. No other details of the history were obtained except that on the day of admission to the hospital she appeared dazed and did not recognize members of her family. A few hours later she had several generalized convulsions

Examination The temperature was 100 F and pulse was 96 There were convulsive movements of the left side of the body, more pronounced in the leg than in the arm. On the right side the arm was held in flexion and the leg in extension, both were mactive. The eyes moved constantly from side to side and the pupils did not react to light. The patient remained comatose between convulsions. Both ear drums were bulging and the breath sounds were diminished over the right upper lobe.

Laboratory Data The hemoglobin was 52 per cent, red cell count was 329, and white cell count was 36,000 with 90 per cent neutrophils. The cerebrospinal fluid contained 3,086 white cells (nearly all neutrophils), no sugar, a 4+ Pandy and H influenzae in smear and culture. There was no record of a blood culture.

Course Sulfadiazine and influenzal antiserum were given immediately. The cerebrospinal fluid

Presented, by invitation at the 141st Annual Meeting of the Medical Society of the State of New York Buffalo Section on Neurology and Psychiatry May 9 1947 on the second hospital day was unchanged. Come persisted. There was a spirite right hemiplega and the plantar reflexes were extensor on both sides. Death occurred on the third hospital day or four days after the onset of convulsive seizures.

Anatomic Diagnoses Acute influenzal meningits, acute subdural empyema, left, ischemic necrosis of the cerebral cortex of the left frontal, temporal, and parietal lobes, acute purulent otitis media, bilateral

Pathologic Findings There was relatively little evudate in the subarachnoid space over the brain and spinal cord In the subdural space there were approximately 30 to 45 cc of vellowish-white exidate which adhered to the outer surface of the arachnoid obscuring the blood vessels and sulei of the lateral surface of the left hemisphere some depression of the left hemisphere by the eru A small amount of purulent evudate was found in both middle ears and mastoid cells but no direct communication with the meninges was seen There were two small superficial foci of hemorrhagic discoloration, 10 cm in greatest diameter in the right parietal lobe. In the microscopic sections the subarachnoid space contained cellular exudate There was a tendency for this to form two layers, each of different composition outer one consisted of degenerating neutrophils, fibrin and bacteria, and only a few lymphocytes and mononuclear cells, the inner one, which included the pin, was made up of a mixture of neutrophilic leukocytes, lymphocytes, plasma cells, and There was swelling of the intims of macrophages small leukocytes, lymphocytes, and mononuclear The subdural exudate was made up entirely of neutrophils, there was beginning organization next to the inner surface of the durameningeal veins were filled with neutrophils, their walls were necrotic and infiltrated with similar cells. Beneath the subdural empyema there was necrosis of the cerebral cortex, the nerve cells and glia-cell nuclei were shrunken and pale or darkly stained, as in recent infarction. In other less damaged areas nerve cells were thinned out and many rod-shaped microglial cells and "plump" astrocytes were pres-In the subependymal tissues there was interstitial and perivascular infiltration with neutrophils and lymphocytes

Comment The amount of purulent subarachnoid evudate was not very great, and it seems likely
that death was due to the subdural empyema The
latter was an unexpected pathologic finding One
could not tell whether the subdural exudate came
first or was secondary to the meningitis The subdural empyema and the accompanying cortical

damage explained the right hemiplegm and the failure of the right arm and leg to participate in the convulsions. Probably no form of medication, incleding penicillin and streptomycin intramuscularly and intrathecally would have been effective in con froling the subdural infection. The proper treat ment would have been surgical drainage and instillation of streptomy on in the subdural space.

Care 2—(BCII NP 46-10) The patient, a girl aged 10 months became ill two days prior to admission at which time she cried more than nor mally and later became quite drows. On the day before entry she began to vomit appeared pale and slept almost constantly Stiffness of the neck, and a temperature of 103 F were noted later in the day

Examination The patient was a well-developed and nourished infant who breathed rapidly and made frequent high-pitched cries. The temperature was 105 6 F., pulse 150 and respirations 44 She was listless but reacted to painful stimuli. The saterior fontanelle was normal. The neck and back were stiff. Kernig's sign was absent. There was a small area of consolidation in the midportion of the right lung field posteriorly.

Laboratory Data The white cell count on admission was 10,850 with 70 per cent neutrophilis The cerebrorspinal fluid contained 18 250 cells per ci. mm., 80 per cent of which were neutrophilic kulkocytes. The protein was 114 mg per 100 cc and sugar was 20 mg. Direct examination of the fluid revealed gram-negative pleomorphic rods that gave capsular swelling with type B anti influenzal serum. The spinal fluid culture was positive for type B H influenzal serum. The blood culture was positive for type B H influenzal serum.

Course. Treatment with streptomycin started immediately after admission. One hundred thousand units of streptomycin were given intra muscularly every three hours for five and a half Then after a recess of two days with no intramuscular treatment 1 200 000 units were given in thirty hours. Fifty thousand units of streptomycin were injected into the spinal canal on admission and 25 000 units were given once every twenty four hours thereafter for the next ten days By the fifth day the temperature reached a normal level and the blood and spinal fluid were sterile but come and muscular twitchings which had developed on the second hospital day porsisted. On the fifth day a pure culture of Staphylococcus aureus was obtained from the nose and throat and was isolated each day thereafter On the eighth day the temperature rose to 102 F and bilateral bronchopneumonia was discovered on x ray examination of the chest. Penicillin 15 000 units every three hours, was given for the next four days. The temperature remained elevated, coma persisted and the convulsions became more severe. Blood cultures grew out Staph, aureus the last two days of life. The cell count of the spinal fluid was 288 of which 46 per cent were neutrophils, the sugar was 52 mg. and protein 38 mg, per 100 cc. The patient died on the twelfth hospital day or fifteenth day of illness.

Analomic Diagnoses Acute influenzal meningitis undergoing resolution thrombophilebitis of cerebral cortex bronchonneumonia.

Pathologic Findings There were only a few small peckets of subarachmoid exudate along the superior surfaces of the corubral homispheres. They were 0.5 to 1.5 cm. in diameter and 0.2 to 0.3 cm. thick and surrounded the bridging volus. Elsewhere only a slight cloudiness of the arachmoid mombrane was discernible. The upper part of the Rolandic vein in each hemisphere was filled with a mottled white and reddlsh-brown thrombus. The ventricles were not cularged and there were no herniations of the temporal lobes or corobellum. Cultures of the subarachmoid exudate were negative.

In microscopic sections of the brain stem and spinal cord and the overlying leptomeninges only scattered small collections of lymphocy (se and histiocytes were seen. The collections of purulent subarachnoid condate consisted of degenerating neutrophil leukocytes and numerous lymphocytes plasma cells and macroplinges. Bacteria were not seen. Several meningeal veins were filled with partially organized thrombi and in the adjacent correbral cortex nerve cells were completely destroyed in some places and were diffusely thinned out in others. In these areas astrocytes were increased in number and there were many picomorphic or rod-shaped microglial cells

Comment. Even though the menungius apparently had been controlled by streptomycin therapy the patient died. The important causes of death were probably staphylococcus septicemia, pneumonia, and convulsive sciences. The latter very likely resulted from thrombophishitis of cerebral veins of consequent ischemic necrosis of the cerebral cortex. It is possible that the poeumonia occurred as a result of the convulsive sciences and coma, and perhaps might have been prevented by more effective anti-convulsant therapy

Case 5—(BCH 1089472) The birth and early development of the patient, a girl aged 0 months, had been normal and there were no serious illnesses until ten days before entry when she began to take her feedings poorly and had nasal obstruction and cough. Seven days before entry she was listless, had a temperature of 103 F and vomited several times. There was a moderately severe diarrhea for two days. Four days before entry the patient had several convulsive securics and became unrespon ave Because the fever did not respond to oral sulfadiasine she was admitted to the hospital.

Examination. The temperature was 104 F pulse 140 and respirations 48. The patient lay quietly in her crib took no notice of her surround ings, and had a stiff neck with slight head retraction. The anterior fontanelle was still open and was movements were normal. Both arms and both legs were withdrawn from pin prick, which also caused whimpering. The plantar reflexes were equivocal, and the examination otherwise was negative

Laboratory Data White blood count was 18,600 with 92 per cent neutrophils. The cerebrospinal

fluid was cloudy and contained 8,600 white cells per cu mm., nearly all neutrophils, a sugar content of 22 mg, and protein of 186 mg. Type B, H influenzae was grown in cultures of the spinal fluid and blood

Course Fifty thousand units of streptomycin were given intrathecally each day for fifteen days, and on alternate days for another week. hundred thousand units were given intramuscularly every eight hours for twenty-one days The blood and cerebrospinal fluid cultures became sterile, the cells in the cerebrospinal fluid were greatly reduced in number and the sugar content rose to 60 mg. There was not, however, a corresponding improvement in the clinical condition. Although the temperature gradually returned to normal, the patient remained stuporous and continued to have occasional convulsive movements of the left leg and sometimes of the left arm Streptomycin therapy was discontinued after the twenty-second day in the hospital. At the end of two months the temperature and cerebrospinal fluid were normal. The head had enlarged 2 cm. in circumference The patient was stuporous She was startled by a loud noise and would stare at a light which she sometimes followed The optic disk margins were indiswith her eyes The pupils reacted to light and there was The left arm and leg were moved no strabismus much less than the right The left plantar reflex was extensor, the right was equivocal The stiffness of the neck had disappeared

Clinical Diagnoses Influenzal meningitis, healed, severe cerebral degeneration, ? thrombosis of cerebral veins, internal hydrocephalus

Comment In Case 3 the infection of the meninges was controlled and the patient survived, but was left with signs of a severely damaged brain. Convulsive seizures occurring for four days before admission to the hospital suggest very strongly that the brain had suffered considerable damage before treatment with streptomycin was begun

#### Discussion

In times past influenzal meningitis was almost invariably fatal. With present day therapy many of the patients survive and some of them have residual signs of a severely damaged nervous system. In one of the cases reported above and in others which we have observed, even though the meningeal infection was controlled, the patient died because of the development of some complication such as thrombophlebitis and ischemic necrosis of cerebral cortex or associated conditions, e.g., subdural empyema, pneumonia, etc. Thus, because of the greater efficacy of therapy, several new clinical problems arise

The following summary is based on a study of cases 1 and 2, above, and 12 other fatal cases of of influenzal meningitis. Six of these cases were from the Boston City Hospital, occurring among 2,661 autopsies, and 8 cases were from the Massachusetts General Hospital where 3,875 autopsies were performed during the time of the occurrence

of the influenzal meningitis. The clinical data and the pathologic findings in these 14 cases are presented below. For convenience of description the cases were classified as acute (one to fourteen days), subacute (two to four weeks), and chronic (more than four weeks) purulent meningitis. Five of the 14 cases were acute, 4 were subacute, and 5 were chronic.\*

# Symptomatology

As pointed out by others, influenzal meningtis is a disease of infancy and early childhood. Nine of our 14 cases were 1 year of age or less and the oldest of the other 5 cases was 7 years.

The initial symptoms of the disease were almost indistinguishable from those of other severe acute infections in infants. In 7 of our 14 cases the illness began with symptoms of a respiratory infection, i.e., coryza in 4, pharyngitis and tonsillitis in 2, and pneumonia in 1, and in these it was sometimes impossible to tell just when the meningitis began. Others media was known to have been present before the onset of meningitis in 1 case and was discovered during the course of the illness in 6 others. In 3 cases there were no indications of an antecedent infection and the first symptoms were those of meningitis.

One of the earliest and most prominent symptoms was an altered state of consciousness, varying from drowsiness to stupor and coma Another was convulsions. Headache was a complaint in only 1 case, that of a 7-year-old boy, all the other patients were too young to tell of this or other subjective symptoms.

Temperatures varied from 100 to 104 F., pulse rates from 130 to 180 per minute, and respiratory rates from 30 to 60 per minute. Stiffness of the neck was observed in all but 2 cases, as in other cases of meningitis in infants it was seldom as pronounced as in older children or adults. Kernig and Brudzinski signs were usually absent unless stiffness of the neck and spine was pronounced.

Other neurologic signs were noted in 7 of the 14 cases Deviation of eyes to one side occurred in 3 cases, in 2 of these it was probably part of a unilateral convulsion. There was an external rectus paralysis in 1 case. Hemiplegia was observed in 3 cases. In at least 8 of the 14 cases convulsions occurred at some stage of the illness. Usually they were unilateral, often being restricted to the face, arm, or leg. Separation of sutures and enlargement of the head were observed either during life or at autopsy in 5 cases. In the late stages of the illness, stupor or coma invariably prevailed. Blindness and deafness

<sup>\*</sup>A fuller account of these cases is being published else

were not observed, but could easily have been overlooked in an infant or because of coma.

The onset of the illness was seldom as sudden or fulminant as in meningococcus meningitis. All except one of the patients survived for at least three days. There was, however, a remarkable variability in the course of the disease. In some cases the onset was so insidious that it could not be dated and the infant may have appeared well several days after the diagnosis of meningitis had been established. Nevertheless if the patient did not respond promptly to therapy, there was a gradual physical decline and death. Inadequate intake of food and fluids led to severe nutritional disorder, anemia, and emaciation, which were undoubtedly contributory causes of death

It was not possible for us to evaluate adequately different methods of therapy viously in this series all forms of treatment were unsuccessful The cases were collected over a period of years and various forms of treatment were used Judging from the clinical course and the amount of infection found at autopsy both immune serum and sulfonamides sometimes had a favorable influence on the clinical course We have received much less pathologic material since the advent of streptomycin The use of intrathecal and intramuscular streptomycin appears to be the most effective means of controlling the infection at the present time

The significant laboratory data were as follows the cell counts in cerebrospinal fluid ranged from 1,330 to 17,760 per cumm with an average of about 6 000 and the predominant cell was the neutrophil leukocyte. The influenza bacillus was identified by smears and cultures of the spinal fluid in all cases, if typable it was usually type B The sugar levels varied from 0 to 34 mg per 100 cc and the protein ranged from 55 to 655 mg

There was a neutrophilic leukocytosis in the blood ranging from 10 000 to 42,000 Blood cultures were positive for H influentate in all except 2 cares.

# Pathologic Findings

The nature and distribution of the lesions found at autopsy differed considerably from one case to another Many of these variations could be correlated with the duration of the illness, but other less tangible factors, such as virulence of infection resistance of the patient, and effects of treatment, must be invoked to explain some of the differences

In the acute cases of meninguis there was an abundant subarachnoid exudate over the brain and spinal cord. As in other types of purulent meninguis it was usually greatest in amount over the base of the brain and dorsal surface of the

spinal cord Occasionally there was a thick accumulation of fibrinous exudate in the spinal and crainal subarachnoid spaces sufficient to block the flow of cerebrospinal fluid. In 1 of the cases (Number 1 above) there was only a relatively slight amount of subarachnoid exudate but a large subdural empyema. In 1 of the acute cases, thrombophlebrits and ischemic necrosis of the cerebral cortex had occurred, in 1 there was slight dilation of the ventricles, and in the other cases hydrocephalus was conspicuously absent. Cerebellar hermation was present in 1 case.

In the more chronic cases the subarachnoid exudate tended to accumulate in greater amounts around the brain stem. Subdural empvema was present in 1 of these cases and a slight fibrinous exudate on the inner surface of the cranial dura was found in 2 others. Hydrocephalus of slight to moderate degree occurred in all except 1 case.

The microscopic changes in these cases were even more interesting than the gross findings. The extreme variability in the duration of the disease, from eighteen hours to seventy-aix days, afforded an opportunity to trace the meningeal infection through different stages. The following is our interpretation of the disease process based on a study of the pathologic findings.

The earliest observable changes are the hyperemm of meningeal vessels and the presence of neutrophilic leukocytes and of blood proteins, including fibrinogen in the subarachnoid space. The neutrophilic leukocytes increase greatly in number and infiltrate the pia and arachnoid, the cellular exudate extends into the sheaths of cranial and spinal nerves and for a short distance beneath the pla into penvascular spaces of the cortex. In a few days many of the neutrophilic leukocytes degenerate and the amount of fibrin increases. Histiocytes, which are found in the very early stages, and lymphocytes, which appear sometime later, gradually increase in relative and absolute number The histocytes enlarge and show phagocytic activity, i.e., neutrophilic leukocytes and lymphocytes can be seen in their cytoplasm. In the latter part of the second week numerous plasma cells appear During the second and third weeks the meningeal exudate is often separated into two fairly distinct layers. an outer one just beneath the arachnoid made up of well-preserved and degenerated neutrophilic leukocytes and a few lymphocytes and macrophages, and an inner one, next the pia, composed of lymphocytes. After the fourth week there is well marked proliferation of fibroblasts. In the later stages of the disease collections of poorly staining neutrophilic leukocytes are often present these resemble small intramoningeal abscesses but are not encapsulated

During the process of resolution the inflammatory cells disappear more or less in the order of their appearance. Neutrophilic leukocytes vanish, macrophages become less numerous, plasma cells are reduced in number, and, finally, only small collections of lymphocytes remain. If resolution occurs during the acute stage, the meninges ultimately become entirely normal, if the meningeal inflammation persists for longer than two or three weeks, there is fibrotic thickening of the arachnoid

In all of the cases changes are found in the In acute cases the enmeningeal arteries dothelial cells are swollen and increased in num-In some cases inflammatory cells are found beneath the intima of the arteries is a common finding in all forms of meningitis, and particularly in more subacute and chronic forms, but it was observed in one of the early cases of influenzal meningitis and was not always found in some of the older cases The infiltrating cells are neutrophilic leukocytes, lymphocytes, and possibly histocytes. The cells seem to enter the vessel wall through foci of necrosis in the adventitia and media In only 1 case was there occlusion of a small artery by a thrombus

Changes in the veins are more difficult to demonstrate because of the thinness of the walls Proliferation of endothelial cells is a common finding, and thrombosis of a vein or venous sinus was seen in 4 cases

In the sheaths and interstitial connective tissue of cranial and spinal nerves there are lymphocytes, plasma cells, and neutrophilic leukocytes, the type of the infiltrating cells being the same as those in the inner layer of meningeal evidate. Degeneration of myelinated nerve fibers with multiplication of Schwann cells, the formation of fatty macrophages, and the proliferation of endoneurial fibroblasts occur rarely.

In some cases there is an evudate in the subdural space, apparently as a result of necrosis of the arachnoid membrane. This evudate may undergo organization by dural fibroblasts. There is also a small amount of exudate in spinal subdural space and, not infrequently, an infiltration of the dura and epidural fat by neutrophilic leukocytes and lymphocytes.

At the beginning of a purulent meningitis very little change can be demonstrated in the brain even though the patient is confused or comatose. In 1 acute case, where meningitis was present for three days before death, the outer layers of the cortex were infiltrated by neutrophilic leukocytes. Since the nerve and glia cells were shrunken and pyknotic, we believed this to be an ischemic necrosis of cortex rather than bacterial encephalitis. After the first week slight but definite hyperplasia of astrocytes and microglial

cells, the latter taking rod-shaped or pleomorphic forms, are present just beneath the pia in the brain and to a lesser extent in the spinal cord. In many cases recent necrosis of parts of cerebral cortex with destruction of nerve cells and ghal cells and vascular and microghal prohiferation occurs. The cortical necrosis probably is related to thrombophlebitis in some cases. Cortical or subcortical abscesses were not found in any of the cases.

Alteration of the ependymal lining of the ventricles is noted in all except the most acute cases. In some the ependymal lining is lacking in places. Subependymal veins usually are surrounded by neutrophilic leukocytes, lymphocytes, and in some of the more chronic cases by plasma cells. These cells are sometimes scattered among activated microglial cells and swollen astrocytes in the subependymal tissues. Infiltration of the interstitial tissue of the choroid plexuses, first with neutrophilic leukocytes and later with lymphocytes, plasma cells, and macrophages, occurs in most cases.

In some of the chronic cases degeneration of the nerve cells of the cerebral cortex is much more obvious, associated as it is with rod-shaped and pleomorphic microglial cells and an increased number of astrocytes, which are swollen and often multinucleated. In some of these cases there is also a hyperplasia of endothelial and adventitial cells of small vessels similar to that seen in an infarct of the same age. Similar changes may be seen in the cortex of the cerebellum and in the hypothalamus. Degenerative changes also are seen in the optic nerves and spinal cord, particularly in the superficial portions.

# Pathogenesis of the Lesions

The exudative reaction in acute meningitis is similar to that seen in inflammations of other viscera and undoubtedly is provoked by bacteria The purpose of this reaction is or their products presumed to be the destruction and removal of the bacteria Degeneration of leukocytes which are believed to liberate thrombin leads to conversion of fibrinogen to fibrin. The fibrin deposit serves to fix the irritant and if it is not soon removed by digestive ferments it will stimulate meningeal fibroblasts Meningeal fibrosis 18 then an indication of a chronic organizing meningitis

The infiltration of arteries by inflammatory cells, which was frequent in influenza and other types of meningitis, is seldom observed in infections of other viscera. Possibly the fact that the adventitia of meningical arteries is made up of an investment of pia-arachnoid accounts for this Evidently bacteria or their toxins can damage more readily the endothelium of the

thm-walled veins than of arteries hence the greater frequency of venous thrombosis,

The explanation of the diffuse changes in the crebral cortex remains obscure. We are of the opinion that this represents a noninfectious encephalopathy and not an encephalitis. It may be produced by a circulatory disturbance, by the proximity of bacteria and diffusible toxins in the subarnchinoid space, or by other factors. The necrosis of cortex and convolutional white matter was almost surely due to ischemia However, we were able to demonstrate thrombi in cerebral venus or venous sinuses in only a few of the cases. Infarction due to arterial occlusion was not observed.

Sections of a cranial nerve, known by clinical test to have been damaged, were not available in any of our cases. Supposedly, a palsy of ocular or facial muscles and sometimes deafness, a the result of an intense inflammatory reaction in the connective tissue sheaths of the nerves. Deafness, of course, may be the result of an infection of the inner car secondary to the men ingits or to otitis media. Blindness was not known to have occurred in any of our cases, but judging from the inflammatory reaction in the meningeal sheaths of the optic nerves the damage to nerve fibers and glial hyperplana just beneath the pia, the mechanism is the same as that which underlies cortical damage

The ependymuts is probably the result of bacteria passing through the ependymial lining and setting up an inflammatory reaction in the subependymial tissues

# Relation of Symptoms to the Lesions

The headache in meningitis is probably due chefly to inflammation of the meninges and quite possibly is augmented by increased intra cranial pressure Head retraction stiff neck and spine, and the Kernig and Brudzinski signs are due to irritation of spinal and cranial nerve roots and the meninges. The only way in which these parts can be splinted and the tension on them released is by extension of head and fection of knees and hips. The muscle contractions which determine the posture are reflex in nature and are maintained by excitation of protective flexor reflexes.1 The stupor coma and generalized convulsions are related unquestion ably to the noninfectious encephalopathy Unilateral convulsions and hemiplegia or other focal neurologic symptoms signify partial or complete necrosis of parts of the cerebral cortex Enlargement of the head or continued elevation of cerebrospinal fluid pressure and hydrocephalus are wholly or in large part due to purulent exudate or adhesions blocking the foramina of Magendie and Lushka, or the subarachnoid space The cause of the cranial nerve palmes is discussed under pathogenesis of the lesions

#### Effects of Treatment

From our pathologic material it is not possible to evaluate the relative efficacy of the different methods of treatment. Although streptomycin has proved to be much more effective than any other substance, our impression however, is that anti-influental serum, sulfonamides, and peniculin all may influence favorably the course of the disease

If treatment is given early, the influenza meningitis often can be suppressed before irreversible damage to the brain has taken place Or, if the meninguts has been present for many days before treatment is started, severe brain damage already may have occurred and death may result from either the meningstas or one of the aforementioned complications. There are how ever, cases which are the exception to this rule where brain leaons develop early in the infection or the opposite, where the patient does not appear very sick even though the infection has been present for a week or two and the treatment results in prompt recovery without residual brain damage In general the best results have been obtained by early and quick acting ther

The proper management of patients with influenzal meningitis entails not only the prompt administration of intramuscular and intrathecal streptomycln but the early recognition and treatment of the various complications described above. Repeated unilateral seizures and hemiplegia are usually due to ischemic necrosis of the cerebral cortex often with thrombophlebitis. and may perast after the temperature and cerebrospinal fluid return to normal the seizures are controlled by anticonvulsant therapy they may contribute to the patient's death. The possibility of subdural empyema should be considered when hemiplems and unilateral sergures are associated with continued fever elevated cerebrospinal fluid pressure and pleocytosis, normal sugar values, and negative culture. The diagnosis can be confirmed by subdural tap and the treatment should be surgical drainage of the exudate and installation of streptomycin in the subdural space. Hydrocephalus, either communicating or obstructive can be detected by frequent measurements of the head and should be treated conservatively (frequent lumbar punctures to reduce cerebroapinal fluid pressure) for several weeks. Usually this will suffice though an occasional case may require a neurosurgical operation. adhesive arachnoiditis with involvement of optic nerves and chiasm, cranial nerves or spinal

cord were not observed in our material but may be expected to occur in some cases

# Summary

The chinical features and pathologic findings of influenza meningitis are presented. The usual clinical picture was a preceding respiratory infection often with otitis media followed by drowsiness, confusion, convulsions, and coma. Fever, stiff neck, impaired consciousness, and convulsions were the earliest and most common signs. Cranial nerve palsies, hemiplegia and unilateral convulsions, and enlargement of the head were often observed in the more chromic stages of the disease. In our fatal cases death occurred in eighteen hours to seventy-six days. Streptomycin seemed to be the most effective thera-

peutic agent In the acute stages the pathologic changes were essentially those of purulent exudation in the subarachnoid space of brain and spinal cord. In the subacute and chronic stages additional findings were diffuse glial changes in the cerebral and cerebellar cortex, and the hypothalamus and optic nerves, perivascular infitrations of subendymal veins, necrosis of the cerebral cortex, thrombophlebitis of subarachnoid veins, and hydrocephalus. Subdural empyema was an occasional finding. The importance of early diagnosis and therapy in the prevention of permanent brain damage is stressed.

# ARMY OFFERS 200 MEDICAL AND 50 DENTAL INTERNSHIPS IN 1948

Two hundred medical and 50 dental internships will be offered by the United States Army in 1948, to be filled by recent medical and dental school graduates The internships will be for a period of one year of active duty

They will be rotating, and will include the follow-

ing services

Medical Internships—medicine, neuropsychiatry, pediatrics and contagious diseases, laboratory, obstetrics and gynecology, general surgery, urology, orthopedic surgery, and ophthalmology and oto-laryngology

laryngology

Dental Internships—x-ray and oral diagnosis, operative dentistry, oral surgery, periodontia, and

prosthetic dentistry

Pay scales for interns as first heutenants will be in accordance with existing regulations covering commissioned officers' pay and allowances. Credit for purpose of pay is given in accordance with length of military service. Subsistence and rental allowances are determined by the marital status of the intern, additional subsistence and rental pay is provided for officers who are married or have other dependents.

Qualifications required for application are

Medical interns—a male graduate of a medical school approved by the Council on Medical Education and Hospitals of the American Medical Association, who is eligible for appointment as a medical officer in the Officers' Reserve Corps of the Army Graduates of foreign schools are not eligible

Dental interns-Citizens of the United States,

graduates of approved dental schools (now completing 4th year of dental training), not over 30 years of age on July 1, 1947, have made no agreement to accept an internship appointment in any other institution, and meet the physical standards for appointment in the Dental Corps of the Army

There will also be 350 fully approved residences for periods of one, two, and three years, depending on the specialty desired and previous experience of candidate, in various Army General Hospitals in 1948 which will include cardiology, contagion and tuberculosis, dermatology and syphilology, internal medicine, pediatrics, physical medicine, anesthesiology, obstetries and gynecology, ophthalmology, orthopedic surgery, otolaryngology, surgery, thoracic surgery, urology, neurology, pathology, psychiatry, and radiology

Qualifications required for application as residents are Regular Army Medical officers or applicants for the Regular Army who are graduates of an approved medical school (a male graduate of a medical school approved by the Council on Medical Education and Hospitals of the American Medical Association, who is eligible for appointment as a medical officer in the Officers' Reserve Corps of the Army—graduates of foreign schools are not eligible) and have completed at least one year of rotating internship in a hospital approved by the Council on Medical Education and Hospitals of the American Medical Association may be appointed as assistant residents, resident or senior resident, whichever is commensurate with their professional background

#### THE INTANGIBLE FACTORS IN THE TREATMENT OF PATIENTS WITH LOW BACK PAIN

With Special Reference to Industrial Patients

WILLIAM P VAN WAGENE & MD, Rochester New York

(From the Division of Neurosurgery University of Rochester School of Medicine)

IT HAS long been known, but sometimes for gotten, that all of the factors in any illness cannot be portrayed on a chart on x ray films a laboratory report, or by physical examination There are intangible factors that play a part in every illness. It is every but as important to recognize and consider these as to record and treat the organic aspects of the illness Par ticularly is this true of the patient with trouble with the back. From times remote, the 'loin' psychologically has been one of the most vulner able areas of the body, second only to the nape of the neck and the temple This fact seems to have been overlooked not only by doctors but also by the industrial public.

Since some representatives of industry and the armed forces feel that the surgical results in the insured patient with ruptured nucleus pulposus are not favorable from their point of view, some explanation must be forthcoming, and, if true, measures taken to correct this There is no question in anyone's mind that the problem of caring for patients who are in some way insured differs from caring for the uninsured This applies not only to those with trouble with their backs but also to those with hernias, fractures of bones, tears of the knee cartilage, concussion of brain, etc The principal difference between the maured and the uninsured patient is that the latter patient is suffering from two or more ail ments medical legal, and, if you will, psychologic The only possible explanation of differing results is that either the insured patient is treated differ ently by the physician and by the industry maning them or that he reacts differently to treatment.

Many, and I think, most conscientious phy sicrans treat all groups of patients as nearly alike as possible. Almost none undertreat the insured patient. A few overtreat the insured patient with too many office calls, too much physiotherapy or medication that is of little or no value. A lew physicians have a penchant for bolstering their own ego by telling their patients both insured and uninsured how very serious their trouble is or how very difficult the operation was

to correct their trouble By doing so they seek Presented at the 141st Annual Meeting of the Medical

to enhance their own stature they may overimpress the patient with the nature or senousness of his ailment A few other physicians are seeking a chance to "get even' with some particular company for real or supposed injustices and do not hesitate to advise patients directly or indirectly to act differently than they would otherwise Another small group of physicians treat their insured pa tients more according to the dictates of some 'home office' physician or adjuster than according to the ments of the case and their own judgment The object of this is the continued good will and financial return from some com pany Another group-fortunately small-sim ply do not know the elemental facts of the pathology or physiology involved in back strain or injury have little idea of accepted methods of treatment, and do not have the ability to criticize and correct their own work and results

The mental attitude of the physician treating a patient with back pain and root pain as well as any other ailment is an important matter and one generally overlooked. There seems to be in the world only a small group of doctors who look with pleasure and eagerness and interest on the problem of unraveling the nature of a back complaint. By far, the majority look upon "backs' as an added cross to bear and assume a discouraged defeatist attitude which is all too soon reflected in their patients my own experience, I have had far better ex perience with patients who have been under the care of a general practitioner than the physician who has "tried everything and who has given the patient the impression that nothing done is of much use

We as physicians, try to talk too much pa thology to the patient. About all the average patient wants to know or needs to know is Can it be fixed and how well? The author does not mean to imply that one should ever do other than hew strictly to the line in his advice to pa tients, but does mean to imply that the best of any situation rather than the worst is to be emphasized There is adoquate room for an infectious, optimistic hopeful, yet truthful attitude toward the future of the patient with a "back,' whether he is insured or not

Society of the State of New York Buffalo Section on Neu-rology and Psychiatry May 9 1947

In addition to a medical ailment, the insured patient has the legal one mentioned, making for a real "complication of diseases" Many patients cannot decide for themselves which is the greater and readily devote their attention to the Both must be treated and cured if the patient is to obtain the desired result. It is of no value to cure a patient surgically and have him devote the rest of his life or an unusually long time to "getting justice" The reverse is Just as there are a few physicians who overtreat the patient, who are vindictive, selfish, ignorant, suffering from an inflated ego, so are there also a few members of the legal They undoubtedly account for a profession certain percentage of the failures under con-The physician who believes that sideration his word carries more weight on medical matters with the insured patient than does a union leader or an attorney is very often wrong. The umon leader who tells the man with the hernin how long he is supposed to be incapacitated does not hesitate to tell the man with a "back" what to do about return to employment

As part and parcel of the treatment of the patient's legal ailment comes the compensation A referee who will not accept court referee good medical or legal opinion that an illness is at an end and close a case can ruin any amount of treatment, however expertly given There is much to be said in favor of a nonpolitical "medical board" to decide the merits of controverted cases for a referee Argument in court between physicians or attorneys over a patient's condition or percentage of disability is most conducive to the development of a mental attitude that no medical treatment can cure, regardless of the actual pathologic condition Not all referees seem aware that few, if any, patients with any senous trouble ever return to former duties without some symptoms for a time Particularly is this true when an operation has been performed on a weight-bearing structure By law, the word of one physician is as good as any other in compensation court. It is incumbent upon the referee to know the relative ments of physicians and to seek and take their advice

Not by any means to be overlooked or forgotten in this discussion is the insurance adjuster and the company foreman or employment manager. Just as the first contact a hospital patient may have is with a medical student or first-year house officer, so the first contact an insured patient may have after the injury\_may be with an adjuster or a plant foreman or the first aid nurse. Such a contact may have farreaching influence, favorable or otherwise. Most adjusters reflect the attitude of their companies who have found that the more correct the medi-

cal information and treatment the less expensive in the long run is the care of the insured Therefore, they are eager to secure this Certain adjusters are in a difficult position in that they are not always their own agent but are under pressure from a "home office," or their company, to close a case as inexpensively as possible To do this, they not infrequently offer a patient a "lump sum" to close his case before rehable medical evidence is at hand Particularly is this true where the complaint is referable to a back or head injury. In order to convince a patient that a lump sum settlement is desirable, it is usually necessary to convince the man that his injuries do not amount to much people with back trouble believe this this, he must convince the man that medical treatment will be hazardous or meffectual or both No one would think of telling the average patient with a herma that he should not have it repaired because he might have a recurrence, might develop a hydrocele, might have a testicle swell up and then wither away leaving him "half a man," might have pain at an operative site, might have a numb area of skin below his incision, etc. However, all too frequently in my experience, adjusters or an employer have told patients solemnly that they might better take a lump sum settlement for a back injury producing a ruptured disk because the operation in question is "on the spine," "near the spinal cord" that no one can assure them that they won't have just as much trouble or more afterwards, that they may have a numb leg or a weak leg, that they may have to "be in a plaster cast," that they may be left with a stiff back, weak knees, or bad arches afterwards

When a patient cannot be "sold" on a lump sum settlement he is then turned over to a surgeon-usually after being away from work for months—and after the patient has "got a lawyer" The surgeon is silently dared to try to get him back to work If he fails, even partly, another entry in the "I told you so" column is It is the author's present practice to refuse to operate upon any insured patients who come in "as a last resort" after being told directly or indirectly by physicians and adjusters that there just is nothing else to try and not much use of trying that The insurance adjuster is further bedeviled by his home office, in some instances at least, to check constantly on "the medical progress of the case" It is not uncommon for a home office to want to see the x-ray films especially where pantopaque or other contrast media are used for study of the subarachnoid bed before any consent for further medical treatment Such interest is understandable at is given times and justified where the doctor is not known

to them, since they are paying for the treatment and eventually responsible for it The consultation with home office officials seldom takes less than two weeks' time, and more often, two nonths. Meanwhile the patient is usually sent home from the hospital, often quite a distance, and subjected to a good deal of discomfort in so doing. Some explanation for being sent home inecessary and only one reason can be given the patient. All this is most conducive to aggrava tion of his legal ailment. The fact seems to be lost might of that the spot wray films do not tell all of the story or present all of the cyrdence in any back complaint. The fluorescopy of the spine is of as much or more, value than the spot film in my opinion It would be far more per tment to the company involved to know and brep a record of the following facts (a) Did the operating surgeon see the fluoroscopy? (b) Who actually made the decision or the x ray interpretation regarding the presence of a pathological condition? Where contrast media is used the author seldom operates on a patient without linv ing personally seen it fluoroscoped

It is the rare patient who after x-ray or fluor ecopy of a spine and the taking of spot films does not justifiably ask what was the result of the examination and what is to be done surgeon who feels he must tell the patient that he cannot say until the films have been sent to the home office had better be doing some other type of work In our clinic, the decision is made at once and the patient told of this If the home office wishes to see the films they should be sent off by air mail and an opinion wired back within forty-eight hours Longer delay is mexcusable and a very definite detriment to the rehabilita tion of the patient. While no surgeon wants to be arbitrary, the final decision as to operation or other treatment must be his, for he is the one who has seen the patient, placed a value on his complaints, seen the x rays and fluoroscopy and the one who must answer to the patient and his family doctor for the result obtained A series of poor judgments or poor operative procedures will overtake any surgeon before he has gone very far If he does not agree with the "home office , be should go ahead according to the dictates of his own judgment and be willing to rise or fall by the outcome of his judgment

Nothing is more disastrous in the treatment of a patient with a low back complaint than to have him convinced that he is being treated as "a bill of goods' Particularly is this true where the person is having constant discomfort or pain and where treatment is withheld because of wrangling over authorization for medical treatment.

There is great need for the study of several

hundred records of patients who are listed by insurance companies as poor results. An adjuster for the Rochester office of the State Insurance Fund has stated that they have some seventy five such records. These should be studied by a committee made up of an orthopedic surgeon a neurologic surgeon a psychiatrist, and a psychologist in an effort to find properly the reason for the poor result if such exists.

Not to be forgotten by any means, is the patient who deliberately decides to use the ill ness as a club to obtain an end A woman pa tient recently left the hospital after the removal of a herniated intervertebral disk. She was free of complaints She abruptly reassumed all of her former complaints upon learning of her husband's extramantal activities while she was She has succeeded in keeping him home to wash dishes, make beds and do other housework after working hours. The insurance carrier lists her treatment as a failure. The physician does not. The referee in court refuses to accept advice and close the case. The patient undoubtedly will continue as an invalid as long as this situation exists.

The patient who is convinced that he is being forced to come for treatment by a doctor selected by an insurance company or by an industry should be disillusioned of this at once If he cannot, he should be discharged. Lafe is too short for the pursuit of policies of appearament with any type of patient—insured or uninsured—or in caring for any patient who does not wish to be treated

Very few physicians have looked upon the ruptured nucleus pulposus in the same light as they would a fractured tibia or femur or a dislocated hip or injury to any weight-bearing structure. There has been all too much of an ary dismissal of the problem as 'just a little piece of cartilage out of place.' Actually the operative site is one of a good deal of stress and strain and the operative treatment for the relief of root compression at times may require a fairly wide dissection of muscle attachments which are normally called upon for bodily support. I believe that the sooner this lesson is treated with the accuracy promptness dispatch and rationale accorded to a major weight-bearing structure the better will be the percentage of rehabilitations

The author does not mean to imply that every case of ruptured nucleus or other root compressive lesion should be operated upon The majority of minor ruptures of the nucleus pulposus will cease having symptoms if treated conservatively. What the percentage of total ruptures of the nucleus pulposus is in the world at large no one knows. I would estimate that

10 to 20 per cent of known ruptures should come to operation at some time There are certain cases of actual disk ruptures that for physical or psychologic reasons might better be left alone Among these are the uneducated, heavy laborer, 50 to 65 years old, who can do lighter work with-The same is true of the patient out discomfort who has had his symptoms for a long time, from two to three years, and who seems to be nearly over his trouble, having had his nerve root amputated physiologically or anatomically The person who loses little time from work is a very doubtful candidate for surgical treatment. The chronic alcoholic in his mid or latter years who has evidence of peripheral neuritis is a subject for very careful consideration To be looked over very, very critically is the person who is dominated by another to a large extent male who complains of a dull ache in his only to have his domineering spouse chime in "No, Herbert, you do not You have it in , and what's more, it doesn't ache, it pains you something terrible," may well be a poor candidate for any surgical treatment Others to be considered carefully are the women who have a record of having to go to bed for a week every month or who give evidence of not standing pain well The man who hopes to pay off the mortgage on the house and paper the upstairs on the proceeds of his insurance is a very doubtful candidate for surgical treatment The political figure or the city hall hanger-on who feels he is a cut above the average and who "is going to have a private room and they are going to pay for it" is another candidate to look over very If he cannot be convinced that he should be treated just like everyone else and on the basis of his trouble alone, he might as well be left alone He will be no greater burden on industry or society without a scar on his back than with, and probably less The patient who has had one unsuccessful operation is a doubly poor risk for another try, no matter what the findings may be

The lower in the scale of intelligence that a patient is, the fewer are the procedures that can be carried out on a trial and error basis less the patient's intelligence, the more prompt must be the settlement of his medical and legal troubles if he is to be rehabilitated to the fullest extent possible The longer the delay between the onset of an illness, the greater is the chance of the patient considering himself seriously ill both medically and legally The more procedures that are carned out that fail, the greater is the patient's justified distrust of any form of treatment The more the patient is convinced of the validity of his legal ailment the less are the chances of being rehabilitated by any medical procedure

There is one other group of patients who present a problem to the insurance carrier as well as the doctor, and who often finally are listed as having "poor" results This group is made up of workmen who have multiple injuries and who, perforce of age, education, disabilities, etc., cannot hope for much except for comfort and relief of pain from spinal root compression ample is that of a 55-year-old laborer who suffered a dislocated right hip, a fracture of both bones of the left lower leg, and a ruptured nucleus The last lesion was eventually the source of his greatest disability because of pain Although comfortable following operation for the disk lesion, he is no nearer doing his original hard work now than before removal of his ruptured nucleus pulposus He is able to do "gate work." He was entitled to comfort regardless of his ability to return to work The particular company in question does not agree with this However, of all companies dealt with, they are in the small minority

The company foreman or the employer or the company agent who refuses to re-employ a patient with a back complaint or one who has had an operation on his back can sabotage any amount of medical treatment. There is great need of careful sympathetic handling of the person returning to work, no matter what the illness has been. A few days or weeks assigned to light work or to shorter hours usually will suffice in rehabilitating most patients with back complaints The army sergeant or the foreman who "doesn't want a bunch of cripples in my outfit" and who proceeds to get rid of them in one way or another is doing a great disservice to all concerned

All of these abstract considerations may sound of small moment when real pathology can be demonstrated in a patient However, 1 firmly believe that the accurate evaluation of the patient's mental attitude and moral fiber is the most important single feature of the successful medical care and rehabilitation of the insured patient, particularly when the injury is to the In order to try to evaluate this, the surgeon must spend ample time on it I do not think that a patient can be evaluated properly much under a week's time for ample observation and thought During that period every reasonable effort should be made to see how he reacts to various situations and to adversity of the devices commonly used in doubtful cases withholding of permission to smoke for a couple of days by keeping him in bed and in a no-smoking zone, asking him to use the bed pan

instead of getting up to go to the toilet, asking him to walk varying distances outside the hospital or climb stairs. Noting his responses to such procedures as lumbar puncture or pantomore studies is also of value Notes on hours of seep the amount and kind of a medication or placebos necessary to keep him comfortable are valuable. The observation of the patient during early morning or evening hours or when playing eards or other games is of value in deciding how much pain a person really has. The patient who tells you in all succenty that he is not at all mirreded in the money involved but only in getting his health back has succeeded in deceiv mg himself in at least one sphere and very likely in others as well The amount of compensation being received compared with his usual emings is reldom a guide to a man's engerness to return to work in spite of what he may say

Patients also may be evaluated by allowing them to talk with others having similar troubles As a matter of fact this seldom can be prevented. In most hospitals, where neurosurgery is done there are seldom less than half a dozen postoperative "backs." New admissions seem to seek them out with uncanny and unerring cor "Follow-up" men patients almost inranably find their way back to the ward to say "bello" to nurses and orderies Women patients for some reason rarely revisit their old ward. New patients seldom nuss a chance to quir them on their progress and this is encour aged. If results cannot speak for themselves, nothing can After new patients talk with those in the postoperative state they are asked a few simple questions "Are you as badly off A or B? What do you want to do about this trouble? Do you want it done here or would you rather go somewhere else? Have you any thing you want to talk about? Do you know how long you may be in bed? Do you know when you should be able to go back to work? Are you having this operation because you want It or because someone else wants you to have 119"

Unless the patient's responses are pretty

straightforward and prompt I do not want him and will not have him on my list of postoperative cases. In the long run, they will be just as well off without operations and industry will be as well off to sottle with them as best they can

#### Summary

The successful treatment of the patient with an injury or a complaint referable to the back requires careful consideration of a number of factors, many of which are of an intangible na ture. The physician is, and should be the one held responsible for the outcome of any case even though there are many factors well outside his direct control. For that reason every patient with a complaint of back pain should be studied as thoroughly for the intangible factors in his illness as for the purely organic ones.

Among these intangible factors are

1 The mental attitude of the physicians who have treated the patient toward back injuries and complaints in general

2 The mental attitude of the attorney who

may be representing a patient

3 The mental attitude of the compensation court referce, or the armed forces disposition board or the judge in court toward continuing or closing a case on good medical advice

4 The attitude of the insurance adjuster and his company toward the patient

5 The attitude of the foreman or the com

pany
6 The attitude of the labor leader and his advice regarding the treatment or return to work

7 The attitude of the patient's relatives

toward his illness

8 The attitude of the patient toward his difficulties, both medical and legal, economic,

and psychologic

By careful attention to these intangible details, as well as the purely organic factors in disease or injury of the back one can expect as good or better final results as can be obtained in the treatment of any malady or injury of other weight-bearing structures.

41t ANNUAL CHRISTMAS SEAL SALE

Beginning on Novomber 24 and ending on New Year's Day the 41st Annual Christmas Seal Sale is being conducted in New York State with a goal of \$1,150 000

In charge, outside of New York City is the New York State Committee on Tuberculosis and Public Realth of the State Charities Aid Association through its 62 affiliated county and city tuber culous and public health associations

A large portion of Christmas Scal funds is devoted to promoting cheek x-ray surveys for the earlier discovery of the unknown cases of tuberculesis and to public health education in the all-out effort to rid New York State of tuberculesis by 1965. Proceeds are shared as follows 83 per cent for the programs of 62 county and city tuberculosis associations in the upstate area. 12 per cent for the state-wide program and 5 per cent for national work.

# THE IMPORTANCE OF EARLY DIAGNOSIS IN THE SURGICAL TREATMENT OF CARCINOMA OF THE LUNG

ADRIAN LAMBERT, M.D., F.A.C.S., New York City

IN THE past the hazards that attended resection of the lung for carcinoma were so formidable that physicians were willing to have their patients live a few months and die later of the cancer rather than risk an immediate death following operation

With the improvement of surgical technic, the simple resection of a lung has become a well-standardized procedure so that the mortality and morbidity following simple pneumonectomy is now relatively low. As experience in this field has increased, more advanced carcinoma cases have been successfully resected and more radical operation than the simple total pneumonectomy has been employed.

Radical pneumonectomy is now employed for carcinoma of the lung which has extended into the mediastinum This operation includes removal of lymph-bearing tissue in the mediastinum, in addition to resection of the lung the left side, the lymph nodes below the aortic arch, and behind the trachea, the lateral tracheal nodes, the cannal node, and the intertracheobronchial nodes are excised in addition to the hilar On the right side, division of the azygos vein with retraction anteriorly of the distal stump at its junction with the superior vena cava allows exposure beneath the cava and enables complete excision of lateral tracheal nodes up to the base of the neck, along with the carrial node and the intertracheobronchial nodes

Involvement of the mediastinum with carcinoma is now considered indication for removal of these nodes. Extension of the growth into the pulmonary artery, pulmonary veins, and pericardium makes removal more hazardous but is not considered cause for inoperability as has been advocated in the past.

With the extension of the carcinoma into the mediastinum, the risk of surgical removal is obviously greater. Not only has the disease advanced so that the patient is in worse condition, but the amount of surgery that he must withstand is correspondingly larger. In an extremely debilitated patient, the operation may be staged so as not to subject him to all the surgery at one time. He must then undergo two anesthesias, however, and run the risk of two operative procedures, so that the one-stage operation is far preferable. The two- or even three-stage procedure

is justified in extremely poor risk patients

The perfecting of the operation of radical pneu monectomy is the surgeon's answer to the medical practitioner who has not made an early enough diagnosis of carcinoma for the surgeon to operate at a time when simple pneumonectomy is pos-Appreciation of the early changes of carcinoma of the lung will enable the physician to make an earlier diagnosis This will bring the patient to exploration earlier and will allow the surgeon to perform simple rather than radical pneumonectomy Thus, early diagnosis will lower the mortality and morbidity of the surgi cal procedure and will increase the patient's chance of five-year survival, because his disease is removed before metastasis has occurred

Review of the causes for failure of early diagnosis resolves itself into an inability to interpret the early x-ray changes of lung carcinoma and poor evaluation of the importance of negative Approximately one bronchoscopic examination fourth of cases of carcinoma coming to operation have a completely negative bronchoscopic examination, and in this group the incidence of resectability is appreciably higher than in those with positive biopsy, which emphasizes the significance of negative bronchoscopy some malignancies of the lung are rapid growing and others are slow growing is well known, but for the rate of growth to be appreciated by \-ri> may mean that the disease has become incurable under the eyes of the physician Similarly, decision to wait for symptoms to develop entails a delay that may allow a resectable growth to become inoperable If more cases are to be resected early in the disease, early exploration on suggestive \-ray changes is imperative without waiting for positive bronchoscopic evidence or the usual symptoms associated with the disease

The frequency with which physicians unknowingly encounter carcinoma of the lung, either on
routine examination or in the course of treatment
for some other condition, makes it imperative
that they familiarize themselves with the x-ray
changes that suggest the disease—Only then will
such cases be directed into the hands of surgeons,
who, by operating early, will insure the best
change of survival

768 PARK AVENUE

### PAGET'S DISEASE AND THE CENTRAL NERVOUS SYSTEM

A.M. Rabiner, M.D. and Morton H. Hand, M.D. Brooklyn. New York.

(From the Jewish Sanitarium and Hospital for Chronic Diseases)

THE-not infrequent occurrence of neurologic syndromes in patients displaying Paget states of the bone has been repeatedly described, but the beas for the development of such symptoms has not been given adequate emphasis

Gles de Tourette¹ and Marinesco² in 1894 and 1890 were the first to report changes in the spinal end in a sufferer from this disease. In the first trenty-five years of this century numerous cases with neurologic complications were described but predically all consisted of well-defined conditions of the nervous system occurring coincidentally with and apart from the bone disturbances Typical diseases such as tabes dorsalis and magomyelia were presented The common association of the disease with the metastatic lesons of carcinoma was commented upon by Wolf who described a case with an esteoplastic utradural bone tumor compressing the right cerebellar hemisphere.\* Pond' reported a case of pituitary tumor with abscess of the sphenoid ams Garvey a case of tumor of the nasoplarynx, and Birds reported sarcomas in 11 of 64 cases of the disease

The first real evidence of disturbance of the spinal cord attributable to the disease itself and resulting from the effects of alterations in the bony envelope of the nervous system was desenbed by Wyllie in 1923 7 He reported spinal cord compression produced by vertebral collapse in the course of Paget's disease Relatively few additional case reports have appeared since then, despite recognition of the occurrence of spinal cord syndromes of this nature Other disturbances such as psychosis, convulsions, deafness visual difficulties due to optic atrophy and brain tumor syndromes have been related to the disease Vamerous authors including Stauder Glassher Greeg 10 Gross 11 Grunthal 12 John and Masser, 13 have shown that Paget s disease of the bone may lead to neurologic symptoms Moynam reported a case with arteriosclerotic symptoms and compression of the brain 14 Marie s case was diagnosed as a paranoid with epilepsy dia betes, and "erosion' of the sella turcien 18 John and Strasser reported 2 cases with intracranial pressure and neurologic symptoms.13 Nonne stated that epileptiform seizures impairment of eight and bearing from nerve compression dis-

Presented at the Annual Meeting of the Medical Society of the State of New York Buffalo, Section on Neurology and Psychiatry May 9 194

turbances in taste trigenimal paresthesias and pain facial paralysis spinal paralysis and neural gic pains of the extremities have all been en countered.<sup>14</sup>

Homen (1901) in correlating the neurological abnormalities and postmortem findings demonstrated the local pressure effects upon the medulia oblongata of the odontoid process, resulting from softening and deformity of the base of the skull produced by decalcification. Schüller (1911) desembed the effects of bony deformities upon the central nervous system. In 1939 Chamberlain reported 4 cases of busilar impression with because neurologic anomalies. In 1934 Wyers laid described such anomalies in a case of busilar impression resulting from the deformities of Paget's disease.

This presentation is concerned with a report of 5 cases of disease of the central nervous system all of which had been diagnosed as clinical entities which were not previously considered as due to the effects of Paget's disease. However upon reconsideration it was noted that each case presented atypical features that rendered the diagnosis of a classic disturbance improbable and therefore the search for an explanation for the unusual features led to the opinion that the effects of Paget's disease had caused the alterations of the central nervous system which produced the symptoms

#### Case Reports

Case 1 -The patient a 52-year-old woman, had suffered two attacks of come that produced transient neurologic signs consisting of weakness of the lower extremities and a left Babinski. Her fixed symptomatology consisted of bilateral deafness and poor vision resulting from optic atrophy She entered the Jewish Samtarium and Hospital for Chronic Diseases in 1939 complaining of inability to walk following a fracture of the femur which occurred during convalencence from pneumonia. Bony deformities typical of Paget's disease with multiple fractures of the extremities were noted on x ray The typical appearance due to skeletal and skull doformities had developed from 1929 to the time of her admission in 1939 Eight months following her admission in August 1939 she developed a sudden coma which lasted fifteen minutes following which she was confused and presented a right supra nuclear facial paralysis. Although all extremities moved the lowers were externally rotated and there was a left Babinski sign. All the signs sub-aded

Five months later there was a within three weeks repetition of transient coma with the same neurologic findings which again subsided in two weeks after there was a change in personality consisting of stubbornness, uncooperativeness, and suicidal be-She subsequently developed several episodes of cardiac decompensation in 1942 and 1943 and expired in August, 1943, from the latter laboratory findings were an alkaline phosphatase of 24 1 Bodansky units in 1939 and 25 92 Bodansky units in 1943 X-rays revealed involvement of all the bones of the extremities and showed that the skull was completely sclerosed with a flattened base There was calcification of the vascular channels, such as abdominal aorta, pelvic vessels, and of the muscles, tendons, and subcutaneous tissues patient had lost 10 inches in height from 1929 to 1943 Her hat size had increased 61/2 inches, from  $22^{1}/_{2}$  to 29 inches Difficulty in hearing began in On admission she had presented bilateral deafness, the skeletal deformities, and poor vision m the left eye so that she could not count fingers Vision was good in the right eye Thus, this patient with advanced Paget's disease entered the hospital with neurologic signs consisting of bilateral deafness and poor vision, having suffered two attacks of coma of fifteen minutes' duration, followed by weakness of her lower extremities and a left Babinski recovered from these sequelae to her coma in two or three neeks She presented an acquired platy basia and diffuse arteriosclerosis which accounted for the acute neurologic disturbances as well as narrowing of the cranial nerve foraminae which accounted for her deafness and visual disturbances

Case 2 -The patient was a man who came under consideration when he developed, in addition to certain fixed neurologic signs, transient ocular muscle palsies that were assumed to be due to intracranial alterations resulting from a pituitary tumor The changes seen in the sella turcica were believed to be due to a neoplasm until further consideration and study indicated that these alterations were consistent with the bony deformities of the skull resulting from Paget's disease This 56-year-old-man was admitted to the hospital in June, 1946, complanning of pain on the right side of the head and body and in the right arm and leg There was bilateral deafness, more marked on the right side, and dizziness when sitting up for ten minutes or more The onset of his disturbances had occurred at the age of 40 when he developed pains in the chest radiating up the neck, around the scapulac, and down both arms He was dyspneic, suffered from gaseous distress, and at this time was confined to bed for three months, he received morphine for rehef and was told that he suffered from heart disease or gallbladder trouble At the age of 47, he noted that he was becoming hard of hearing, the deafness being apparent in the right ear where it was accompamed by tinnitus At the age of 49 he suffered from attacks of vertigo, tinnitus, and weakness, so that he fell one day when getting out of bed had been unable to walk since Thereafter weakness extended to the right arm and fingers He was hospitalized for three weeks and was discharged with

the diagnosis of Paget's disease, Mémère's syndrome, and fracture of the third lumbar vertebra With the onset of vertigo he developed supra-orbital headaches which occurred with change of position In 1940, at the age of 50, he noticed that his head was becoming larger Upon hospitalization in 1942 there was noted a spastic weakness of the right lower extremity and weakness of the right upper ex tremity, increased tendon reflexes in the right upper extremity, and increased and equal reflexes in the lowers where bilateral ankle clonus was present Bilateral papilledema, a left central facial weakness bilateral nerve deafness, a fine tremor of the tongue and concentric diminution in the visual fields were X-rays revealed evidence of Paget's reported disease with compression fracture of the third lumbar vertebra, osteoarthritis of the spine, and osteoporosis of the posterior half of the left side of the The alkaline phosphatase levels were 307 and 32 1 Bodansky units, and the acid phosphatase was 39 Gutman units He complained of con tinual backache and headache throughout this period of hospitalization

When hospitalized in June, 1946, his complaints were unchanged Bilateral deafness, more marked on the right, weakness of the right upper and lower extremities, bilaterally hyperactive reflexes with bilateral ankle clonus, a positive left Babinski with confirmatory signs and tremors of the upper extremities were noted Ocular convergence and upward gaze were limited. The retinal arteres were sclerotic and the visual fields were contracted.

He complained of double vision one month later At this time the right eye was deviated outward The right with loss of motility in all directions pupil was larger than the left, both pupils reacting The optic nerves were pale and sluggishly to light the disk margins were blurred There was bilateral nerve deafness more marked on the right right lower extremity was spastic, the knee and ankle jerks were bilaterally hyperactive, with ankle clonus and Rossolimo signs on the right and a Babinshi on Only the left lower abdominal reflex was the left sluggishly present A hyperalgesic zone was noted at the sixth dorsal level on the left and slightly higher on the right

In September the right eve had regained most of its motility, the optic nerve heads were still blurred and pale but the visual fields appeared grossly por-By October the ocular paralysis had commal There was weakness of the nght pletely subsided lower extremity and slight weakness in the right Rossolimo's sign was obtained on upper extremity the right Babinshi's sign was not elicited. alkalme phosphatase was 958 (June, 1946), 163 (December, 1946), 23 4 (January, 1947) Bodansky Spinal tap revealed an initial pressure of 152 There was no evidence of submm of water arachnoid block Fluid analysis was within normal X-rays revealed an old fracture of the third lumbar vertebra and possibly of the fourth with anterior dislocation of the lower lumbar vertebra General decalcification of the spine and pelvis was The skull was enlarged, cotton woolly described m appearance, with an enlarged flattened sells

I MEL S DISE USE IND THE CENTRAL VERLOUS SISTEM

turce and widening of the angle between the anterior and middle forsze of the skull and flattening of the tase. The orbits were distorted as a result of aperimposed calcifications and decreased density. The optic canals were indistinct and there was an an of calcification in the region of the left optic framen. A pneumo-encephalogram taken January 3 1917 revealed a marked increase in aubarachnoid ar Cerebral neoplasm was thus climinated as a case of the transient ocular symptoms.

Can 3—This patient was a 55-year-old woman thi tripical head and skeletal deformities of Paget s fease. She had suddenly developed a left hornipiesa and loss of speech in March of 1945 Four months later on admission to the hospital she promuted bilateral deafness, and pale blurred optic disk margins together with a left hemiplegia and sphais.

The alkaline phosphatase was 19 6 13 7, and 13.5 Bodansky units on several occasions in Bis. Y-rays of the skull revealed a heavy flattened wh turcica, involvement of the orbits and sphematical ridges elliptical distortion of the foramen agrams and a woolly appearance of the vault with temendous thickening of the skull tables. The attretters disks from the aixth to tenth dorsal tertebra was fractured. The abdominal north was calcifed. One year later she presented bilateral pyramidal findings, consisting of Babinski Rossolimo and Chaddock signs

Although this woman developed an acute homi pera, she presented multiple signs of diffuse involvment of the central nervous system due to the stall and spinal deformations as well as the vascular things associated with Paget a disease.

Case 4.—A 45-year-old man entered the hospital is 1931. He complained of a sudden onset of slutting of the right upper and right lower extremities in 1924 at the age of 38 a few weeks after an automobile acculent. The tremors lad increased in in leasity to the time of admission. The right leg was dragged in walking the right upper and lower extremities were spastic, the arm being hyperprotected and adducted. There were rhythmic tremors of wide amplitude (Flügol type) in the right upper extremity and of lesser amplitude in the right lower extremity and of lesser amplitude in the right lower extremity and of lesser amplitude in the right lower extremity and of lesser amplitude in the right lower extremity. A right central facial palsy bilateral labinations, champing movements of the javs tremor of the head and slurred mumbling speech were noted.

Thus patient presented features of Parkinsonism thesity comusting of rhythmic tremors of the right entermities immobility of the face and cycballs dissipated eye wink, anteroposterior tremors of the bead, champing jaw movements cogwheel phenomena in the involved extremities and difficulty in upward gaze and convergence. There was evidence of pyramidal disease consisting of bilateral Babinski signs and hyperactivo tendon reflexes. Cerebellar pathway disease was manifested by bilateral finger to none and heel to knee atxia. There was bilateral point arrophy Y ray revealed advanced Paget's disease of the skull pelvis and hips, and spine The skull revealed an irregular dense deposit throughout

its tables most marked in the frontal region with flattoning of the base and calcification of sphenoidal ridges and other foramina. Calcified blood versels were observed. The alkaline phosphatase was 15 Bodansky units.

2001

The diagnosis of multiple sclerosis had been made in 1925. Unistory of remission and exacerbation of the disease was not obtained. The diagnosis of epidemic encephalitis was made in 1920.

The sudden onset at the age of 38 of neurologic signs indicative of basal ganghon, cerebellar pyramidal tract and optic nervo disturbances in a patient in whom a diagnosis of acute encephalitis and multiple selerosis had been made many year previously could be attributed only to the effects of Paget's disease upon the nervous system. Vascular alterations and bony distortion are considered the basis for these alterations

Case 5 -A 58-year-old man was admitted to the hospital in July 1946. At the age of 45 he had developed sudden weakness of the left upper extremity and both lower extremities without loss of conecrousness. A few months later he experienced sparms of both lower extremities. A diagnosis of multiple sclerosis had been made in 1937 had been no evidence of remissions, exacerbations, or ocular bladder or reusory disturbances. One year later he presented spastic paralysis of both lower extremities flaceid paralysis of the left upper extremity loss of vibratory perception in both legs and feet with diminished perception of painful and thermal stimuli to the level of the iliac crests tendon reflexes were not obtained in the right upper extremity were sluggish in the left upper extremity and were active in the lower extremities where bilateral ankle clonus, bilateral Babinski, and Hoff man signs were obtained. The abdominal reflexes were not present. Upon hospitalization in 1946, he presented bilateral optic nerve pallor flaccid weak ness of all the musculature of the left upper ex tremity with atrophy of the intrinsic muscles of the hand and unobtainable reflexes The abdominal reflexes were not obtained. The lower extremities were spastic and presented adductor spasm and hyperreflexia, ankle clonus and bilateral Babinski signs. Vibratory perception was lost in both lower extremities, being diminished to the level of the iliac crests The patient therefore presented Paget's disease

of the bone and a syndrome recembling amyotrophic lateral sclerosis Spinnl tap revealed no evidence of subarachnoid block The alkaline phosphatase was 8.8 Bodansky units Lipoid was noted within the lumbosacral subarachnoid space. There were increased areas of density in the lumbar spine the fourth lumbar vertebra revealing marked deformity with lipping, narrowing of the intervertebral space between the fourth and fifth lumbar vertebrae increased density alternating with decreased density throughout the pelvis deformity of the tibiac with changes similar to those of the pelvis, increased density of the skull consistent with Paget a disease calcification of the pelvic vessels and advance hypertrophic arthritis in the entire cervical spine. This patient likewise presented an atypical neurologic syndrome associated with Paget's disease The vascular and bony alterations of the latter are considered the basis for the neural alterations

These 5 cases presented various types of symptomatology resulting from involvement of the nervous system Three cases were deaf, 4 revealed optic atrophy, 4, involvement of the brain, and 3, involvement of the spinal cord turbances may be attributed to alterations produced by the deformities of the skull, spine, cramal nerve foramina and calcified vessels which were present in every case None presented typical syndromes but the diagnoses of multiple sclerosis, acute encephalitis, amyotrophic lateral sclerosis, paralysis agitans, spinal cord tumor, brain tumor, and cerebral thrombosis had been made, the etiologic relationship of Paget's disease having been overlooked or disregarded

Levi, in 1897, showed that changes in the neryous system in this disease were often secondary to endartentis and penartentis of the small vessels of the spinal cord which resulted in poor blood supply to the cord, the bony disturbance and vascular changes being coincidental in the same patient 21 Emerson (quoted by Lewin 22) believed the cord changes are due to arteriosclerosis conception subsequently was verified by Hudelo and Heitz in 190123 and by Palmgren in 1927 24 Gielman stated that atheromatous changes in the vessels were found constantly in the disease 26 The common occurrence of vascular alterations in our cases would serve to support the contentions of these observers Schwarz and Reback stated that arteriosclerosis is very frequent and that some writers have suggested that the bony changes may be compensatory to altered blood supply to the bones by arteriosclerotic blood vessels 26

Gutman and Kasaback in their report of 116 cases ascribed the symptomatology to pressure of the bony envelope of the nervous system upon the cerebellum, spinal cord, and nerve roots <sup>27</sup> Gregg believed that long before the stage of gross deformity of the skeleton had occurred, symptoms of interference of function of the nerves crowded by proliferating bony structures may appear <sup>10</sup> The presence of deafness and optic atrophy in our cases bears out this contention

The frequency of the various types of symptomatology was reported by Gutman and Kasaback who stated that hearing impairment was the most common manifestation of cranial nerve involvement, reporting 26 cases with deafness in their series of 116 cases <sup>27</sup> Impairment of vision was not uncommon but optic atrophy was observed in only 4 cases. Clinical evidence for diagnosis was not present in two thirds of their cases and the diagnosis depended on \ray studies. Involvement of the base of the skull occurred in 7

cases and then only in the presence of advanced lesions of the vault — Four cases in our senes of a showed basilar alterations

The frequency of hearing difficulty may be attributed to the deformities of the base. Fowler reported 99 cases in which deafness was an initial symptom in 3 and a major symptom in 41 in stances <sup>73</sup> Lindsay believed that impairment of hearing does not occur except in patients with extensive disease of the skull, including the temporal bone <sup>29</sup>

In Gutman and Kasaback's series, x-ray evidence in the spine occurred in 26 cases in the dorsal, in 51 cases in the lumbar, and in 5 cases in the certical spine Turner stated that it is not the "advanced" cases that suffer from spinal cord compression. He described three types of spinal syndrome, namely, those due to compression, those due to vascular disease with sudden onset possibly secondary to compression, and those due to vertebral displacement producing hematomyelia. Three of our cases showed fracture deformities of the vertebral bodies, all showed extensive involvement of the spine and interspaces. Psychoses appeared in one case in this group

Paget, himself, noted with surprise that the mind remained unaffected even when the skull was un usually thickened Stauder stated that only rare reports are found concerning psychic disturbances 8 Smith<sup>31</sup> reported 2 cases and Kaufman, 4 cases 32 Increased intracranial pressure has usually been accepted as the cause of psychic disturbances A study of the skull x-rays in advanced cases, however, reveals an actual increase in the brain case capacity The encephalogram in case number two with a pituitary tumor syn drome revealed dilatation of the subarachnoid spaces with air, suggestive of the presence of "cortical atrophy" Although this patient presented no psychotic symptoms, the typical skull enlargement with a relatively normal cerebral outline confirms the presence of an increase in the This patient like capacity of the skull cavity wise demonstrated an enlargement and flattening of the sella turcica which was altered in shape duc to flattening of the fossae of the skull cases have been described by Hurwitz<sup>33</sup> and Levi <sup>21</sup> Len's description in 1913 of conversion brought attention to the occurrence of acquired platybasia in Paget's disease 34 Lewin demonstrated three cases with shallow and elongated sellae such as occurred in our case 22 This deformity is brought about by sagging of the base of the skull around the foramen magnum which is supported by the spine, the weight of the cerebral hemispheres depressing the sphenoid and The upward slope of petrous temporal bones the anterior basal portion of the occipital bone and the dorsum sellae become reduced or lowered.

moducing a platy basic and in severe cases a conresolusie The anteroposterior and transverse skull diameters are increased and the vertual diameter is decreased. Torsion, stretching and saring of the brain stem resulting from these bony deformaties, therefore may produce eranial herve agas as well as signs referable to involvement of the pyramudal system

The etiology of Paget a disease of the hone does not establish the cause, but it has been suggested that it may be eaused by a central ners our system disturbance Lancercaux suggested such a nosstility and pointed out the relationship between bone dystrophy and nervous disease as an argu ment in its favor 25 Lewin believed that central arrous system disturbance may produce an al tered bone metabolism, the duetless glands being intermediary in its causation 22 Ivimov sur galed a trophic center for bone in the nervous 175km.34 Knagg37 and Kaufman32 formulated the concept of a toxic cause stating that arterial and bone changes were due to the same process home,16 dangreeing with Guillain 13 and other French authors who maintain that the disease is rephilitic in cause, looked with favor upon the assumption that it may have some connection with disordered parathyroid function chemical alteration found in the disease is an in crese in alkaline phosphatase in the blood (Kay 1020) \*\*

#### Summary

1. When neurologic symptoms occur in patients with Paget's disease of the bones the effects of the latter upon the nervous system must be considered as the causative factor

2. The alterations in the nervous system are the result of compression of nervous structures by the deformed bony envelope of the central neryous system and of the disturbances in nutrition caused by calcification of blood vessels of the brain and spanal cord

2 The diagnosis of neurologic syndromes in patients with Paget's discuse too frequently is dissociated etiologically from the latter

4. Five cases are reported in whom the alypical neurologic features of paralysis agitans,

amyotrophic lateral sclerosis, multiple sclerosis, brain tumor spinal cord tumor cerebral throm bosis acute encephalitis, and recurrent coma with transient involvement of the nervous system sug gested an atypical cause for their production

# CANADIAN FEDERAL HEALTH SCHEME LOSES GROUND

According to Paul Martin Canada's Minister of ational Health and Welfare the Dominion health scheme is loung ground due to lack of interest

In 1916, the sovernment requested \$42,000 for the purpose of investigating health insurance. Only \$4,700 was apout on the study In 1947 only \$27 882 \$27 863 was requested. Fallure of the scheme is

attributed to the fact that the planners were unable to devise a plan satisfactory to the medical profession. There is every indication that Canadian doctors would rather work through voluntary plans and insurance programs than through a government department.-Canadian Insurance September 8 1947

# NARCODIAGNOSIS AND NARCOTHERAPY IN THE NEUROSES AND PSYCHOSES

PAUL H HOCH, MD, New York City

(From the Department of Clinical Psychiatry, New York State Psychiatric Institute)

TOW far does the sodium amytal technic HOW far does the sound help in pyschiatric diagnoses? Blickwenn made the first claim, stating that in neuroses and functional psychoses he required less of the drug to set forth stimulating or narcotic effects than he did in the organic psychoses This claim is to some extent correct, but in the majority of cases we cannot confirm it Since 1930 much evidence has accumulated proving that sodium amytal can be used effectively in differentiating neuroses from psychoses Furthermore, it can be employed in order to gain a better understanding of the structure of a particular neurosis or psychosis In everyday psychiatric practice, it is quite a common experience to be confronted with this vexing problem anxiety neurosis or depression true manie attack or schizomanie reaction, or, most often, schizophrenia versus psychoneuicsis These conditions often await differentiation the same way, the differential diagnoses of manicdepressive psychosis or schizophrenia, and psychogenic or organic conditions often are greatly facilitated by sodium amytal About half of the patients interviewed following administration of amytal disclosed mental contents which were not revealed before, many patients disclosed hallucinations and delusions which were not sus-This effect is especially apparent in prtients in whom schizophrenia is suspected but in whom no clinical evidence is present to establish the diagnosis Misapprehension is to be allayed at this point concerning drug-produced hallucinations or delusions Doses of 3 to 7 half-grains of sodium amytal do not produce imaginations of delusions in persons in whom a psychosis is not present, with the exception of some patients showing marked exhaustion, for example, those with war neuroses We never saw a drug dehrium in our patients Admission of hallucinations and delusions usually are related by the patient in a vein similar to that observed during a routine clinical interview Many patients, furthermore, are not amnesic after the sodium amytal interview and later on know what they disclosed during the interview and can be confronted with that evidence Sodium amytal does not influence the structure of the hallucinations and delusions Thus bringing into bold relief the morbid productions without

Presented at the 141st Annual Meeting of the Medical Society of the State of New York Buffalo, Section on Neurology and Psychiatry May 8, 1947

distorting them is a great advantage of amytal and pentothal over cocaine, alcohol, scopolamine, cannabis indica or mescaline, and many other Besides eliciting hallucinations and delusions, other mental mechanisms become more echolalia, bizarre obvious too Mannensms associations, and incoherence are also illuminated during the interview In addition, the patient is able to give an interpretation of his symptoms and sickness and, in general, is inclined to discuss his own interpretations. Functional amnesias. similarly as in hypnosis, are also revealed in any These observations are in no contra diction to the observation that many psychotics apparently become normal in speech, ideation, and behavior under amytal, and that it is posible to produce in them with the drug, a temporary lucid interval Usually, soon after injecting the drug, the patient is in a communica tive frame of mind The above-mentioned symptoms are displayed in about the first half of the interview As the first impact of the drug wears off and more is injected, slowly the morbid phenomenon indicating a release or lowering of certain coordinating or inlubiting functioning begins to disappear and a synthesis takes place, leading to the normalization of the patient This bifocal action is quite interesting (Seconal, even in small and not fully explained amounts intoxicates much more rapidly than amytal and sometimes shows this type of reaction more clearly) It is possible that, in a small amount, the drug acts as a cortical stimulant, but in higher doses, as a depressor If such is the case, in this respect it shows a similar action During ether narcosis at as alcohol or ether first excitatory and later cortical depressive Insulin. too, to manifestations are observed some extent acts similarly

Many patients before the interview are in a state of emotional tension, dominated by fear, and complaining about many somatic disturbances. In these cases, it is remarkable how quickly sodium amytal removes the emotional push between the symptoms, eliminates fear, and diminishes the perception of bodily sensations. The patient becomes more detached and is able to view some of his symptoms, like obsessions and phobias or some delusions, more objectively because the emotional impetus is reduced. Therefore, secondary manifestations

of the mental state are removed and the essential pamary disturbances are in clearer focus. The dynamics of the psychosis or neurosis usually become clearer, especially in the neurosis. An assessment of the most important points of the dynamics can be obtained faithy rapidly.

dynamics can be obtained fairly rapidly Narcotherapy in different forms, such as narcosuggestion, narcocatharms, and narco-analysis was extensively used in the treatment of war neuroses. It was proved to be of great value in dealing with functional amnesic states of all hinds, in influencing conversion symptoms in amoving auxieties, and in influencing certain psychosomatic conditions. A large number of patients suffering from the more superficial form of war neuroses responded well to this form of treatment In those patients, however, in whom a marked emotional instability was present before the appearance of the war neuroses, or in patients abs previously were suffering from a neurosis which was only activated or aggravated due to the war experience, thus treatment was less effective. In many of the superficial war neu roes, fatigue or exhaustion played an important role and the overstimulated nervous system needed sedation. In this form of treatment, edation and psychotherapy were linked together The drug facilitated the psychotherapy by rapully establishing a better contact The abreaction of incidents loaded with anxiety or other emotional elements was facilitated. This emotional discharge was made easy and relatively painless. The general emotional instability and especially the anxiety were relieved. The patients who were usually very tense and over wrought relaxed completely Another great advantage of this treatment was that the vegeta tive dysfunctions which are so often present in the war neuroses were diminished considerably and that the patient's oversensitivity to stimuli was markedly reduced. It was also obvious that many hysterical mechanisms were relieved More superficial ones showed a restoration of dissociation very quickly sometimes even before Pychotherapy was applied In others however Psychotherapy reinforced the action of the drug The drug produces in many individuals a form of hypnotic trance which facilitates the application of psychotherapy and at the same time by detaching the patient from the anxiety is able to reveal some of the underlying structure of the war neuroses The removal of inhibitions by the drug establishes a better rapport especially in shy individuals who are preoccupied with the ideas and experiences they seemed ashamed to men tion A great deal of time is saved by this method

of investigation and questioning

Even though we were aware of the fact that
the structure of the civilian neuroses is quite dif-

ferent from that seen in the war cases and especially that the element of fatigue and exhaustion is not often present in the ordinary neurosis many other mechanisms are quite common. For instance dissociations in hysteria and especially anxiety manifestations in the anxiety neuroses The vegetative manifestations of anxiety like palpitation of the heart, gastrointestinal disturbances and perspiration which are the tension accompaniments of the anxiety, often produce typical manifestations which are similar to those seen in the war neuroses. We believe that the same advantages which this treatment offered in the war cases will show in the civilian neuroses It is apparent that this form of therapy yields different results in the different forms of neuroses The best results are obtained in the anxiety neuroses and conversion hysteria cases of anxiety hysteria and in the obsessivecompulsive neuroses the response is much less satisfactory even though in these individuals a marked amelioration of symptoms can be achieved at least temporarily This method again demonstrates the fact that the more superficial neuroses are responding to brief psychotherapy in the same way that they are responding better to other forms of psychotherapy whereas the more ingrained and more deeply structural used psychoneuroses are much less influenced. In the anxiety neuroses and in the conversion hysterm, this treatment form accelerates the treatment and makes it available also to individuals who otherwise would not be able to afford psycho-The elimination of anxiety and the relief which patients receive due to the quieting of the vegetative manifestations make the treatment also effective in individuals whose intelli gence does not permit the application of psychoanalytic methods which require a rather good intelligence to understand psychodynamics. The marked suggestivity which is occurring in these patients during an amytal treatment enables us to combine a hypnotic technic with the more ex plorative one using both elements in psychotherapy the quick symptom elimination of hysterical or anxiety symptoms on one hand and the deeper exploratory treatment on the other hand It enables the physician similarly as in hypnosis, to use a covering and uncovering treatment simultaneously

It is important to mention that brief psychotherapy does not mean lay psychotherapy nor does it mean that now psychotherapy can be handled more quickly and effectively by persons who have very little acquaintanceship with psychiatry. We have the impression that some groups think that by injecting the drug and suggesting a few things to the patient psychotherapy is given. I believe some of the failures with this

technic can be attributed to the fact that persons not sufficiently acquainted with psychotherapy in general were unable to utilize its advantages It is obvious that a formal knowledge of psychotherapy is probably more important in doing short psychotherapy than in long, because the necessity of adjusting the therapy to the patient and of utilizing the material the patient produces in a short time is more complicated than if long-term psychotherapy is applied Horslev stresses the fact to avoid a stereotyped technic in this method of treatment which is still in an experimental stage A stereotyped technic tends to give stereotyped results He suggests, for instance, that light narcosis sometimes succeeds where deep narcosis is completely unsuccessful Suggestion succeeds where analysis does not and vice versa

In the following there are a few illustrative case histories

# Case Reports

Case 1 —A 26-year-old woman patient developed an anxiety state in June, 1944 She claimed that she became sick after donating blood, even though this was her third donation and on previous occasions she did not develop any symptoms complaints were pulpitation, dizziness, weakness, fear of death She had to give up her work patient stayed home for several months and as her leave of absence was approaching its expiration date and she did not want to lose her job, she was looking for treatment A trial of short psychotherapy was suggested Under sodium amy tal, the patient revealed that she actually became ill by serving as a nurse's aid in a mental hospital. She became upset seeing a patient hugging and kissing another patient She developed the idea that she would become insane too. She revealed a marked hostility toward her mother who dominated her, and an mability to adjust in male company very marked ambivalence toward the supervisor at her place of work.

The patient had eight interviews in which she elaborated on all the above-mentioned material. Anxiety diminished markedly, palpitation disappeared and she resumed work.

Case 2 —A 30-year-old man, rather reticent, was referred for treatment with the diagnosis of peptic ulcer which was verified by \ray He was treated for one year for angina pectoris His symptoms were palpitation of heart, fear at times, increased perspiration, feeling of dizziness When upset about something at home or at the office, he had pain in his stomach and heartburn He was convinced that he was suffering from heart disease and lived accordingly In several psychotherapeutic sessions with sodium amytal, the patient related the following Since childhood he has been suffering from anxieties which have become much more marked the last three years He is afraid something will happen to him, thinks of death, and is very superstitious He tries to buy his way of out his anxieties He says "If today I am not anxious or if nothing happens to me or my family, I will give some money for charity" He has quite a number of similar rituals which should prevent the occurrence of a catastrophe He is obsessed by thoughts con cerning his family, especially his mother, because his parents are growing old, he is preoccupied with every little sign of weakness in them. It is inconceivable to him that they could die He is very much attached to his family and moves practically only in his family cycle. In another session, he revealed that all the time he has to think of sexual things which obsess his mind and make him absent-minded. He is married, but he is not anxious about his wife or his child. He is only able to perform intercourse when he thinks of another woman other than his wife, he reyeals ideas that he would like to live with his mother in the same place where he lived as a small child and would be rather reheved giving up his marriage and his adult responsibilities. All this material was rather quickly obtained from the pa tient with many details which we have no time to describe The anxiety of the patient was relieved, and the marked tension, which prevailed before the He had no treatment, diminished considerably pain in his stomach, attended to his business with increased efficiency, and lost many of the phobia. and obsessional thoughts As the neurosis appeared to be rather deep-seated, a prolonged form of psichotherapy was suggested. The patient, however, was unable to do so and retained the improvement, which was obtained by short psychotherapy in about twenty sessions, for about nine months Even though it is not claimed that the neurosis was elimi nated in the patient, for the first time in many vears he received a very impressive symptomatic relief which enabled him to work and adjusted him fairly well. This example indicates that even in very deep-serted neuroses, where usually short psychotherapy is not sufficient, temporary results of fairly long duration can be achieved

Case 3—A 42-year-old woman patient, with a previous normal history, had been riding in a car when at a sudden stop she fell forward and struck her chest, sustaining a slight bruise There were no other organic findings

Soon after the accident, the patient complained about mability to move her leg An hysterical page ralysis of the right leg was found The patient asked for compensation for the injury, but did not pres her claim Psychotherapy with sodium amytal was started At the first session, the hysterical paralysis of the leg was removed In following sessions the patient disclosed that before she suffered the acci dent she was in a constant state of anxiety for about eight months She is obsessed by the idea of passage of time She constantly had to look in the mirror to see if she was growing old or not. The fear started about eight months ago when she had to pass a funeral procession She tried to figure out why we are born and why we have to die Later on, she had attacks of fear when she had to pass funeral parlors and beauty shops She was sleepless at night, and had to think in obsessive fashion about her past life The patient was married, and had entertained the idea of divorce for several years, but was afraid if the divorced her husband she would not be able to remarry on account of her age and especially because of her looks. She considered herself much older looking than her age. The patient received psychotherapy with amytal for about twenty sessons. In the beginning, suggestive treatment was applied to remove her symptoms, later on analytic technic was followed with free association. material gathered was then explained to the patient Se readily gained insight into some of her fears and eren though the explanations did not follow back the neurosis to its probable origin and paid more attention to the actual anxiety structure than to the infantile one, the patient rapidly lost her symptoms drored her husband remarried again and has been symptom free for the last two years

#### Comment

Different drugs can be used for narcotherapy Short-acting barbiturates are the best. We appove of sodium amytal or pentothal because the disinhibitory effect of these two drugs is superior to other barbiturates, but nembutal or evipan ran be used too Horsley requests that the drug wed should have a selective action on the hypothalmic region of the brain, that the drug should be safe and productive of a fair degree of narcosis without causing a serious clouding of consciousness. The narcosis is produced very slowly by injecting the drug gradually usually 3 to 10 grains of sodium amytal are sufficient. One grain n injected in about one minute. We keep the needle in the vein and start with the question immeshately injecting as much of the drug until the patient is somewhat drowsy but not actually deepy The patient should be in a state of pasave relaxation, able to understand fully what the therapist tells him and should be able to reply dearly When the patient begins to show nystag mus or the speech becomes slightly slurred, further injection of the drug should be discontinued If the patient should show a rapid recovery from the drug, further injection can be given later When the patient is in a state of relaxation, sug gestions can be given easily because of the hypnoid state which is produced by the drug Or, if the analytic approach is used the patient is asked to associate freely or to associate certain selected topics introduced by the therapist As the patient is in a state of hyperamnesia and inhibitions are removed usually forgotten memory ma teral is obtained easily and dissociations of memory, especially, and circumscribed amnesias are eliminated quickly The same thing is true for other dissociation mechanisms like hysterical con version. At the end of the amytal treatment it is best to give the patient suggestions for the lifting of some of the most outstanding symptoms like the anxiety or hysterical manifestations. salent factors in the neuroses have to be brought

out and the patient confronted with them. This synthesis can be done under the influence of amy tall or in separate sessions without using the drug. The treatment should be repeated about 2 to 3 times a week or if necessary even daily, until twenty sessions are reached. If the patient does not respond to twenty sessions it is not likely that the patient can respond to this form of psychotherapy. Other methods used in connection with other forms of psychotherapy such as recluention obviously are used in connection with amytal treatment, too.

The use of this form of psychotherapy in the civilian neuroses is still in an experimental state, even though especially in England, we have a number of reports on its use. To mention only a few Sargeant Slater Fraser, Stungo, and Horsley report favorable results.

At present we still know very little about the selection of patients for certain types of psychotherapy. It is obvious that not all cases need the same kind of treatment. In our experience with narcotherapy in various cases, we would tentatively say that this method is working well with the anxiety states and conversion hysterias as mentioned before.

In cases of anxiety hysteria and in the obsessive-compulsive neuroses the response is much less satisfactory even though in these patients an amelioration of symptoms can be achieved, at least temporarily. We did not treat character neuroses and sexual perversions by this method. Drug addicts and alcoholies were not included Gratifying were the results in some psychosoma tic cases of stomach ulcer tachycardia, and head injury. In these patients it was possible to detach the vegetative disturbances from the neurotic mechanisms and to relieve the patient of his symptoms of pain diarrhea, and headache. This method again demonstrates the fact that the su perficial neuroses respond to brief psychotherapy.

We do not want to imply that the patients we treated with narcotherapy would not have responded to ordinary psychotherapy but it would have taken a lot of time to accomplish this and many patients have neither the time nor the money to submit to extended psychotherapy. We know for instance, that in most clinics the treatment of the neuroses is unsatisfactory. The patient can be seen for only a short time and at infrequent periods. In these cases we believe that a trial can be made with the short form of psychotherapy.

It is obvious that the long range psychother apy with many sessions has great advantages over an abbreviated form of treatment. First, the time element is very important. If a patient is treated for two or three years, it is obvious that

it is much easier to influence him than if he is treated for a few weeks. Spontaneous recession of symptoms, which occur easily in two or three years in many neuroses, also can be booked to the credit side of a long treatment. This contingency will scarcely occur with short-term treatments.

A great advantage of a long-range psychotherapy, furthermore, is the lack of pressure under which the therapist works, it does not have to produce results quickly—It can be more circumspect and, being more active, would result in fewer mistakes It is obvious that the transference will be a much deeper one, and the chinging type of dependent patient would show more relief from symptoms on a prolonged form of treatment than otherwise, even though in this special group of patients, the long duration of the treatment is sometimes more of a liability than an asset The possibility of revamping and re educating the patient in a prolonged analytical procedure is much easier than otherwise The psychiatrist who uses short-term psychotherapy probably will have to be satisfied with symptomatic relief in many cases, and will be able to give only some, but not full, insight into the causative mechanisms of the individual neurosis It is obvious that a full immunization will not be achieved in all instances. but in many of the more superficial neuroses, this procedure will be sufficient, as it is astonishing to see how many neurotics respond to suggestive measures without needing lengthy treatment This short-term psychotherapy in connection with sodium amytal offers the following advan-It is short, less time-consuming, many more patients can be treated simultaneously, and financial burden on the patient is much less than with other types of treatment. This treatment form has three aspects (1) the diagnostic, (2) the therapeutic, and (3) the prognostic

The diagnosis of a neurosis is easier with sodium amytal than without it Under the influence of the drug, the patient is in a state of relaxation, inhibitions are lowered, the ability to speak is fostered, the establishment of a transference is rather quick, resistance is overcome much more quickly than without the sedation The ability of the patient to produce will be determined quickly Focal points of attack on the neurosis will reveal themselves quicker than otherwise The structure of a neurosis if not too deep-seated, can be reconstructed in a few sessions, and a decision can be reached quickly as to whether or not the neurosis is too deep-scated to be amenable for a short-term treatment

In observing the therapeutic aspect it is seen that the sodium amytal produces in the patient First, euphona Second, the breaking down of inhibitory mechanisms, therefore establishing

Third, the drug puts the rapid transference patient in a suggestible frame of mind under the influence of the drug are more suggest-Fourth, it demonstrates ible than otherwise to the patient the ability of the physician to control organic dysfunctions by relaxing the patient eliminating the conversion manifestations of anxiety, and freeing the patient from the hombard ment of sensory perceptions He, therefore. makes the patient free to concentrate on the treatment without giving him the excuse to dwell on the symptoms. Fifth, it has a strong appeal to the patient because it uses physical means of approach which the patient generally accepts more readily, based on his preconceived idea of a physician He also feels less isolated with his disorder because the treatments are partly medical, and he does not feel set apart having an emotional disorder instead of a physical one. This treatment is superior to hypnosis because in most of the patients a state of relaxation and suggestibility can be obtained, while hypnosis fails in many instances, especially with overanvious patients It has, furthermore, the great advantage that the patient does not give up the symptoms on a command, but, by a combination of suggestive and cathartic procedures, he gains some insight into the dynamics of the neurosis, which has more prophylactic value than a simple command hypnosis

We cannot state very much up to the present about the disadvantages of this form of therapy We are sure that it will fail in many cases in Honever, in which neurosis is quite ingrained such cases, even a very prolonged analytical treatment often fails Only extensive research will establish the criteria for one treatment or another, or will be able to demonstrate how many more patients are cured with the prolonged form of treatment compared with the short ones We believe that the failure with the short-term treatment does not do any extensive damage because a prolonged analytical treatment could always be instituted if the short type of treatment fails

Another danger of the treatment may be the patient's addiction to it. The relaxing effect of the barbiturate on tense, anxious individuals is great, and it is not impossible that some of them would crave the treatment more for the drug than for the psychologic help which is offered with it. Alcoholics and drug addicts, or persons who are addicted to sleeping medicine, are surely not suitable individuals for this type of treatment.

In cases of war neuroses we had no disagreeable experience. It was always possible to cut the drug transference in the same way as emotional transference. In the common neuroses, further studies have to be made on this point.

# METABOLIC AND NUTRITIONAL ASPECTS OF ARTERIAL HYPERTENSION

EUGENE FOLDES M.D., New York City

In the pathogenesis of arterial hypertension the circulatory blood volume seems to play a sguificant role. Increase in the circulatory blood volume is followed by an increase in the blood pressure, decrease of the circulatory blood volume is followed by a decrease in the blood pressure. Other factors also enter into the development of arterial hypertension, but the circulatory blood volume alone is distinguished by being more easily accessible to therapeutic approach.

Aming at the reduction of the circulatory blood volume the antiretentional diet was omployed. This diet is rich in proteins and vitasius, and is restricted to a greater or lesser extent in carbohydrates, fats, table salt, and liquids For a man of average height and weight and under ordinary living and working conditions, this det would consist of from 112 to 135 Gm. of proteins, from 150 to 260 Gm of carbohydrates, from 40 to 50 Gm. of fat, from 1 to 1½ L. of liquids (including the fluid content of fruits) and the smallest amount of table salt compatible with the enjoyment of the nical

Administration of this diet was followed by a reduction of the blood pressure in many instances <sup>1</sup> and the validity of the original observation was confirmed during the years in a great number of cases. The following are a few cases which serve as an illustration.

# Case Reports

Case 1—Mr D D aged 54 came under observation on October 23 1944 He was referred by unophthalmologist (Dr J Fried) whose findings conasted of a thrombosis of the central vein of the rerea. Hypertensive changes also were found in the e)egrounds. Physical and laboratory examinations showed normal results occept for a blood procesure of 169/98 mm. Antiretentional diot was administered and at the time of this report was still being followed by patient. The observations are summarized in the following table.

Ortober en	Blood Pressure	
October 23, 1944	160/98 mm.	Antiretentional dist be-

Case 2 — Ar M L. aged 47 came under observa too on May 1 1946. He was referred by an ophthalmologist (Dr. N. Nelson) because of hyper tensive changes of the eyegrounds. The patient said that two years previously he was told that he had high blood pressure. Examinations including chemical examinations of the blood showed normal results. The response of the blood pressure to the treatment was as follows

	Blood Pressure	
May 1 1046	180/100 mm.	Antiretentional diet be-
May 14, 1946	148/90	gun

		again ordered
Pahruary 12 1947	142/84	

Case 3 — Mr A. V., aged 47 came under observation on September 17 1046 He stated that the consultation was not prompted by any complaint on his part but because he was rojected by an insurance company several months proviously as a result of a blood pressure finding of 175 mm. The examination including chemical examination of the blood showed nothing noteworthy except hypertonsion Subsequently the following was observed.

	Blood Pressure	
Reptember 17 1946		Antiretentional di t
October 1 1946	154/100 148/98	
October 15 1946	138/80

January 4 1947	142 /90	Had insurance examina-
·		tion, blood pressure of 138 mm. found by in-
		urance physician

Case 4 — Dr A. W., agod 50 came under observation on May 17 1944. He complained of occasional cramps in the abdomen and distribed. His blood pressure had been high for soveral years past and usually ranged over 200 mm. The examinations revealed palpable peripheral arterial walls and a dilatation of the sortic arch. The blood chemistry was normal The everground showed arterial spasms. Yra, examination of the gastrointestinal tract and the gallbladder showed normal conditions. Subsequent observations were as follows.

Passed insurance examination with blood pressure of 138/90

Case 5—Mr H H, aged 42, came under observation on September 21, 1944 His blood pressure had been high for the past eight years, his systolic blood pressure was usually 190 mm while the diastolic blood pressure fluctuated between 140 and 160 mm Previous physical and laboratory examinations showed normal conditions. He had no subjective complaints. On examination, aside from hypertension, nothing unusual was found. The blood pressure readings were as follows.

	Blood Pressure	
September 21 1944	210/138 mm	
September 25 1944	198/136	Antiretentional diet

June 27 1946	180/120	Diet not observed

The theoretical considerations with reference to the role of the circulatory blood volume in the pathogenesis of arterial hypertension and the practical results under discussion were confirmed by the observations of others in essential hypertension <sup>2-4</sup> as well as in hypertension in eclampsia of pregnancy<sup>5</sup> with the aid of the antiretentional diet<sup>2 3 5</sup> as well as by other means <sup>4 6</sup>

Additional confirmation of the significance of the circulatory blood volume in the pathogenesis and therapy of arterial hypertension also was found. When diabetes develops in the hypertensive patient, or when the blood sugar rises

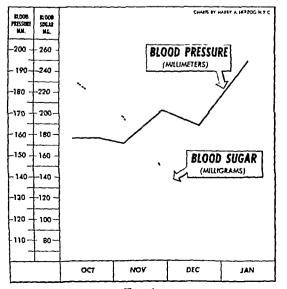

Fig 1

in the hypertensive diabetic, his blood pressure drops. If, then, the diabetes is brought under control with a decrease of the hyperglycemia the blood pressure remains at the lower level for a while but eventually it rises to the previous high or higher. In other words there is, in general, an inverse relationship between the blood sugar and the blood pressure in the sense that fluctuations of the blood sugar level are followed by fluctuations in the opposite direction of the blood pressure level.

Since the publication of these findings, two more cases were observed

Case 6—Mrs T R, aged 64, came under observation on October 8, 1946—She stated that she had had diabetes for the past seventeen years and recently was treated with a diet and 16 units of protamine zine insulin daily. Initial examination showed a blood sugar of 232 mg and urinary sugar of 18 per cent. By increasing the insulin gradually up to 32 units, the glycosuria disappeared and the blood sugar dropped to normal. For corresponding fluctuations in the blood pressure see Fig. 1

Case 7 -Mrs E S, aged 61, came under observa tion on June 14, 1946 Her diabetes was discovered sixteen years previously, and during the last five years she received treatment consisting of a diet and daily injection of 20 units of protamine zinc insulin On the initial examination there was no sugar in the urine and the blood sugar was 136 mg Because of obesity an attempt was made to reduce the body weight by reducing the caloric intake administration was reduced and subsequently dis continued on September 27, 1946 By reason of a rise in the blood sugar, which was considered undestrable, administration of 18 units of protamine zinc insulin was started again on October 4, 1946, with the result that the blood sugar returned to an almost normal level For corresponding changes in the blood pressure see Fig 2

One possible explanation of the phenomenon under discussion is that the diabetes produces an effect similar to antiretentional therapy. The antiretentional effect can be explained as being brought about, in diabetes, by the hyperglycemia which leads to glycosuma and the attendant poly-

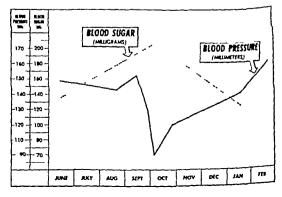

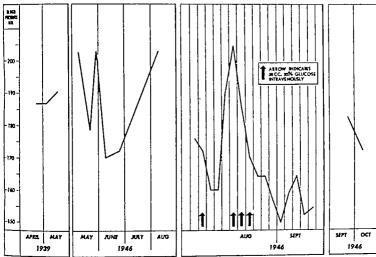

Fig 2

Fro 3

uria and thus causes a loss of liquids from the body and a reduction of the circulatory blood volume. And vice versa when the diabetes is brought under control the antiretentional effect stops and this eventually lends to an increased circulatory blood volume and to an increased blood pressure.

Another possible mechanism of the antiretentional effect of the hyperglycemia also deserves consideration In this connection two facts should be kept in mind The one is that there are glands of internal secretion which when stimulated increase both the blood sugar and the blood pressure Such a gland is the adrenal corter. The other fact to which attention is called is that as a general rule endocrine glands decrease their hormone output if such conditions prevail in the organism which the gland promotes and vice versa For example the gonadotropic hormone of the anterior pituitary stimulates the gonads If increased quantities of the androgenic or the estrogenic hormones circulate in the body due either to pathologic conditions or brought about artificially, the gonadotropic hormone output of the antenor pituitary usually diminishes conversely diminished function or removal of the gonada leads to increased anterior pituitary gona dotropic hormone output. Examples like these can be multiplied It seems then that when the blood sugar rises in the hypertensive diabetic the

the hormone output of the adrenal cortex (a gland which tends to raise the blood sugar) decreases. Decrease of the adrenal cortical function leads to increased elimination of sodium chloride from the body through the Lidneys and thus to a reduction of the circulator; blood volume and a reduction of the blood pressure

If the correctness of this reasoning is admitted the question arres as to whether therapeutic exploitation of this concept is feasible In particu lar an answer should be sought to the question of whether the blood pressure can be reduced in the nondiabetic hypertensive patient by raising the blood sugar, for instance by intravenous glu This seems to be a difficult if not cose injections hopeless undertaking in view of the fact that the hyperglycemia that is produced by this method But the attempt appears to be less ıs short lived honeless if consideration is given to the observation that the drop in the blood pressure which follows the rise of the blood sugar outlasts the duration of the latter? It would seem possible therefore that a series of intravenous glucose injections may lead to a reduction of the blood pressure which outlasts the injection therapy. In one case in which this concept was put to test the following was observed

Case S — Mrs. N 8 aged 58, first came under observation on April 20 1039 She complained of beadnehes and stated that high blood pressure had

been discovered five years previously A systolic murmur over the aorta was found, and a blood pressure reading of 186/100 mm was obtained tine treatment was applied, and on the two subsequent occasions, when she was seen in the year 1939, the blood pressure readings were 186/100 and 190/ 116 mm., respectively

She was seen again on May 9, 1946, complaining of a pressure in the chest and a choking sensation when walking An electrocardiogram showed concave ST1 and ST2 and a prominent Q3 Chemical examination of the blood showed normal The treatments and the corresponding blood pressure readings (See Fig 3) were as follows

ni . . . 1 n . . . . . . . . .

October 10 1946	172/90	

This patient was seen several times during the past seven years. When routine measures were applied, the blood pressure rose from the original 186/100 mm to 202/100 mm On antiretentional dietary treatment there was a drop in the blood pressure on most occasions, but never below 170/90 Following a single intravenous injection of glucose, the blood pressure, decreased to 160/76 mm for two days and then a rise occurred When the intravenous glucose injections were repeated on three successive days, a gradual drop in the blood pressure was observed, the lowest reading being 150/80 mm This drop was still present one week

after the last injection, but was not found when the patient was seen again three weeks later at which time a blood pressure reading of 182/90 mm was obtained

Obviously, a single case is no proof of the con cept and is not presented with that intention But the findings show a drop in the blood pressure following intrivenous glucose injections to a level which is not recorded during an observation of seven years Further, there was a drop in the blood pressure following intravenous glucose in jections on two occasions It is noten orthy that the blood pressure dropped after one injection to a lesser extent than after three injections It also should be considered that subsequently the blood pressure rose to approximately the previous level on both occasions, but remained at the low level for a shorter period after one injection than after three injections These facts and the fact that the phenomena observed are in accord with the theory are suggestive and make further experimentation desirable

# Summary

- Dietetic (antiretentional) treatment is frequently effective in arterial hypertension
- Fluctuations in the blood sugar level are followed by fluctuations in the opposite direction in the blood pressure level of the hypertensive diabetic
- In one case of (nondiabetic) essential hypertension intravenous glucose injections were followed by a drop in the blood pressure
- All of these phenomena are in accord with and are derived from a theory of arterial hypertension which considers the significance of the circulatory blood volume

#### CONGRESS DELUGED WITH HEALTH BILLS

Dr Joseph S Lawrence, director of the American Medical Association's Washington office, reports that 132 bills and resolutions pertaining to health and medical practice were introduced in the last Congress Of this number, 51 were introduced in the Senate and 81 in the House

Thirty-six of these had identical companions in the other House, 21 were accorded hearings before

Senate committees and 35 before House committees Of those having hearings, 19 Senate and 21 House bills were reported to their respective floors and 15 passed the Senate while only 11 passed the House Of these, three Senate bills, five House bills, and one joint resolution passed both Houses and with one exception became law -Secretary's Letter, American Medical Association, October 20, 1947

#### THE NATURE OF ACUTE LEUKEMIA AND THE INTERRELATION SHIP OF THE MALIGNANT DYSCRASIAS

ROBERT D BARNARD M.D Laurelton, Long Island

A RECENT editorial has stressed the appar A ent increase in leukemia mortality 1 There is no breakdown in available statistics into scute and chrome types Difficulty is sometimes encountered in such specification because of the lack of agreement in classification of transitional cases, leukemia, like other neoplastic diseases, shading from cases actually approaching benign ancy to those of fulminant malignancy bukema may be malignant only "by virtue of stustion,' the ucoplastic cells exerting their deleterious action mechanically by crowding out ntal parenchyma. Such cells however are easily asseptible to radiation or other curbing influence to that protracted remission may be procured Systemic cholinergic into ucation, the feature of the malignant dyserasias which kills is not prominent in chronic leukoses, but chronic leukemes may revert to and die of a pathodynamic requence comparable to that which operates in acute leukoses This further complicates statistical evaluation

The practicing physician however, is less concerned with statistics and terminologic nicetics than he is with the fact that one out of every thousand children is carmarked for death from one of the malignant dyscrasias From lus stand point chronic leukemia is not nearly so tragic as is the acute form. He knows that in the former the patients have time for adjustment and resig nation following attainment of which the patient may hve for years. Acute leukemia on the other hand, poses a heart-rending problem with which every physician is familiar But its dominant importance transcends the drainatic feature of hopelessness. Since it forms the terminal stage and mode of all leukemin, development of successful therapy for acute leukemin should solve the entire leukemia problem. For though we do not know the cause of chronic leukernia which appears to be a primary neoplastic discuse its han ding is rather more relevant to the cancer problem than to the one which we will discuss. Acute leukemia, on the other hand is a reactive or second ary neoplastic disease, the cause of which may actually be close to elucidation The explanation of the paradox that we can do something for the counterpart whose cause remains unfathomed lies in the fact that we are dealing with purely mechanical pathodynamics in the case of chronic leukemia and that it is simple by x ray or other irradiation to decelerate the pathodynamic sequence Perhaps by an appreciation that this sequence is altogether different in acute leukemia more success would attend our efforts in the Inttor

It is the purpose of this report to discuss par ticularly the pathodynamics of acute leukemia since the mechanism of death in this disease is identical with that of almost all the other malic nant hematologic dyscrasias. Such a discussion is a necessary preliminary to any approach toward rational therapy

The procedure against acute leukemia has al ways been based on morphologic considerations because the morphologist continues to dominate the hematologic field To the morphologist there appeared to be the same type of marrow hyperplasia or neoplasia that characterized the chronic leukemias and this "hyperplasia would have to be dealt with in the same manner by curbing or stifling the fractious proliferation With universal failure attending this approach warnings have been sounded particularly by Goldman 3 that physiologic considerations were being ignored True, an attempt was made to apply the results of Miller and Turner who found a possible underlying metabolic abnormality to therapy with myelokentric acid but here again the object was destruction of myeloblasts and stall the children died . Folic acid therapy did have a physiologic connotation but it was applied as a hit or miss supportive expedient and there is a reasonable expla nation of why it in turn has failed

Nevertheless, strictly physiologic considera tions were emerging from the background classic works of Sabine and Davis on cholinester ase and studies on phosphatase abnormalities in certain blood dyserisins have been published 6.6 simultaneously and independently Schwind and the author's group at Halloran General Hospitals administered plasma to leukotics with def mitely salubnous effects. The evaluation of the latter by Schwind although on a morphologic basis was, nevertheless, physiologic since the criterion was myeloblastic maturation rather than destruction The author and his coworkers rehed on general chincal appraisal having given massive plasma doses to replenish the depleted blood cholinesterase that characterizes all the malignant dyscrasias.

This approach had been mandated by consider ations developing over a period of years, consid

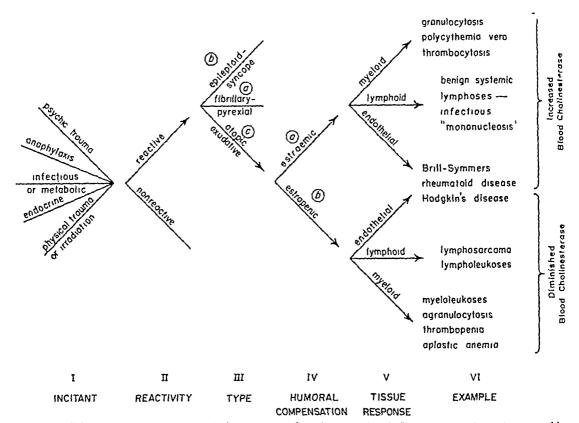

Fig 1 Schematic representation of the course and pathways of r cholinergic episode and its possible culmination in one of the acute malignant hematologic dyserasias

erations whose implications have wide application to clinical medicine and, therefore, are developed in some detail They permit the premise that acute leukemia is one example of a series of peculiar and infrequent but still physiologic, constitutional reactions to what has been termed a cholinergic episode The latter, in turn, may be defined as a medical or surgical event which is followed or accompanied by evidences of parasympathetic autonomic activity in a reactive Only a small percentage of humans are so reactive, blood donor syncope, which was chronologically the first cholinergic episode to be thus defined, affects only about 7 per cent of those who subject themselves to actual or anticipated blood donation and this minor fraction, alone, reacts to the (psychogenic) cholinergic stimulus by convulsions and/or frinting The last is an example of a cholinergic reaction and this, if sufficiently protracted (as in suigical shock) may be referred to as a cholinergic state

The diverse but still composite convergent instrumentalities that may operate, individually or conjointly, to constitute a cholinergic incitant are depicted in Section I of the diagram of Fig 1, for example, any of the following—a trivial surgical procedure, typhoid vaccination, a localized or generalized infection, or the transient estripenia (reduction in blood cholinesterase) produced by ridiation, might set off the divergent lamifications of cholinergic reaction, one of whose terminations could be death from acute leukemia. This eventuality, though rare, seems to follow the specific pathway indicated in the diagram. The latter, it must be emphasized, is far from complete, though it does permit formalization of the actual interrelationship of the dyscrasias. The potential pathways will be traced to their various terminations.

(Section II, Fig 1) That the instrumentalities listed as precipitants of cholinergic reactions fail to excite such reactions in the majority of instances is due to the fact that only a small minority of humans are cholinergic reactors, where they occur in the life of an individual who is not a reactor, they do not constitute cholinergic stimuli and there has been no cholinergic episode. This answers the question frequently raised as to why everyone getting typhoid vaccine does not succumb to acute leukemia. Only a few people aspirating virulent pneumococci will develop lobar pneumonia.

Where cholinergic reaction occurs it appears to be due to the circulation of parasympathomi

metic substances (acetylcholine, iminazolyl gnamidal and/or peptono denvatives) which may be demonstrated by appropriate tests of the reactar' blood. The signified cholinergic intovaration manifests itself in one or a combination of three types of reaction shown in Section III of Fig. 1.

(IIIa) A fibrillary-py rexial reaction classically the 'chills and fever' syndrome sometimes accompanied by pressor manifestations or tetany

(IIIb) An epiloptoid-syncope reaction consisting of swooning with or without a convulsive phase and attended by diaphoresis and pallor, as in blood donor syncope or surgical shock.

(IIIe) The atopic-exudative reaction is that which will be elaborated, for it is in this direction that a cholinergic reaction must proceed to culminate in one of the malignant dyscrasias pes (and the term is used here in the sense of a constitutional 'allergic diathesis'') need not be conditioned by any previous, specific rensitization ton but may become manifest as a result of any of the cholinergic incitants, e.g., "emotional aller Atomic reactions are the only cholinergic reactions where tissue changes may be overt and this feature accounts for exudative phenomena which are so frequent Purpure termination of scute leukemia is the result of hemorrhagic exudation due to an increase in blood heparin exactly comparable to that extant in anaphylactic pur Dom

Atopy has a unique effect upon bone marrow function. Leukopenia is the rule in acute anaphylaxis and we now regard leukopenia as a sign of marrow depression.

In the compensatory phase of most allerge states, the cosmophilic myeloid elements show selective, proliferative tendencies which accounts for the eosinophilia and suggests that in this phase there is some degree of marrow stimulation. The evidence for the last connotation of cosmophilia is indirect and somewhat involved and concerns us here only in that it furnishes an example of myeloid dissociation," a phenomenon that reaches culminative example in acute leukemia and constitutes the block upon which the morphologic school appears to have stimbled

Under ordinary circumstances the three mycloid elements mycloblasts, erythroblasts, and megalanyocytes elaborate their perpheral end products in surprisingly uniform ratio and in a harmony that indicates the close relationship that must exist among the three cellular elements concerned in hemoporeus. This concomitance extends to the majority of hematologic conditions. In polycythemia where there is known crythroblastic hyperactivity, there is in addition to the crythroma an absolute leukocytosis and throm bocytosis as well. In fact, the ultimate ratios

obtaining among the peripheral inveloid elements of poly eythemic blood are about those of normal blood. The blood cholinesterase concentration (which is the most accurate index of crythropoietic activity) is also increased.

In those two conditions where pan-marrow hypoactivity is acknowledged aplastic and mac receive anemias there is a proportionate drop in granulocytes and platelets. A similar concomitance can be traced through certain obscuring features of other hematologic conditions. In hemolytic anemia or that of chronic blood loss, though the red cell concentration may be reduced the simultaneously accelerated crythropoiesis is accompanied by increased granulocyte thrombocyte, and cholinesterase production

Seldom except in the leukemias does this relationship not obtain, and even in the dissociation' of leukemia the inherent concomitance of my cloud function is indicated by cholinesterase studies.

Cholmesterase production, a myeloid function is the humoral barrier to cholinergic intoxication When a cholinergic episode has occurred the blood of the reactor is flooded with aretylcholinelike substances an attempt at compensation takes the form of a call upon the bone marrow for greater cholinesteruse production If the need is met (IVb) the cholinergic intoxication is vitiated and, even if the cholinergic incitant persusts, its effects will be curtailed by the estrema (increased blood cholinesterace) and it will never attain a malignant degree Examples of this transpiration are furnished by the chronic allergies, benign systemic lymphoses ( 'infectious mononucleosis'') and the rheumatoid diseases

But there is another possibility Suppose that a cholinergic episode (I) occurs in the life of a reactor (II) whose constitutional predisposition mandates the atopic response (III) and there is failure of humoral compensation (IVa) exactly will then occur? The answer appeared simultaneously from studies of two different and apparently unrelated dyscrasias Davis work ing with dogs poisoned by acetylcholine found a macrocytic anemia and estrapenia. Human permicious anemia patients also showed an estra penia and a reciprocally increased blood acetyl choline content 11 The author's group im pressed by the pronounced cholmergic features of acute leukemia (whereby these patients exhibited the symptoms that one night expect if both acetylcholine and an anaphylactogen were being pumped into their veins) found an estrapenia proportional to the acuity and chinical severity of the condition 12 Estrapenia of a degree sufficient in itself to account for the cholinergic intoxication was likewise found to be a feature of the known hypoplastic dyserasias Acute leukemia in this

sense, appeared to be a marrow hypoplastic condition in spite of the plentitude of immature myeloid forms of cells extant In other words, morphologic and physiologic criteria of marrow There is, however, an activity were at variance adequate explanation for this variance

It now appears that the unhampered circulation of cholinergic substances, which have the chemical common property characteristics of protoplasmic poisons, 13 in an atopic type of reactor, will depress the bone marrow and particularly that function of the marrow which has to do with elaboration of blood cholinesterase Thus, there will arise a vicious circle of progressive estrapenia and further cholinergic intoxication which constitutes the alternative response to compen-In other words, if there is not a reaction to cholinergesis in a compensatory manner, by estrema, the atopic reactor must inevitably react in the opposite manner, by estrapenia, which introduces a spiral of further cholinergesis leading to cholinergic decompensation (IVa)

The last response is a malignant one linergic into ication having overcome the humoral defenses, the last stronghold remains that of the phylogenetically older and less appropriate cellular defenses The outcome of the struggle will depend on whether the tissues are apathetic or make the effort borne of desperation, in either event tissue changes must occur The nature of such changes are indicated, in so far as the hemopoietic and related tissues are concerned, in sections V and VI of Fig 1 One in whom potentiality for myeloid proliferation remains will make a vicarious and indiscriminate response toward hemopoiesis, this falls short because the lone cell produced, which is the myeloblast, does not engender a cholmesterase-containing series fact, all that myeloblastic proliferation in acute leukemia succeeds in is snarling what ancillary defenses remain to the body and the result is for-A more fortunate myeloid response is that which occurs in agranulocytosis or thrombopenia, for here the situation is not irretrievable the point to be made is that we have succeeded in developing a category of myeloid responses to the estrapenic atopic episodes, and that this category includes the agranulocytoses, thrombocytoses, aplastic anemias, and aleukemic, and leu kemic myeloid leukoses which are, in fact, tran sition forms of the same fundamental process. The unity among these conditions has been obscured by apparent morphologic diversity

Where the tissue response, arising in the wake of humoral cholinergic decompensation, is lymphoid, lymphosarcoma or acute leukemic lymphoblustosis is the morphologic result. Evidently these conditions are basically related to the malig nant myeloid dyscrasias, a relationship that is reflected in their practical clinical identity with the latter An endothelial response, in turn, will elaborate those varients of the malignant dyscrasias that are now grouped for classification in the category of Hodgkin's discase But the intrinsic fundamentality of their interrelationship with the malignant myeloid and lymphoid dysemsias is an entrancing avenue of approach to the goal of successful therapy

## Summary and Conclusions

By tracing out the multiplicity of pathways that a cholinergic chain reaction may take and by taking into account the role of constitution reactivity in the selection of these pathways, it is possible to show a fundamental interrelationship of all the malignant, hematologic dyscrasias Differences which appear to exist among them, such as those of morphologic constituency, may be merely minor reflections of differences in tissue response to humoral cholinergic decompensation

#### POSTGRADUATE **FELLOW SHIPS AVAILABLE**

The National Jewish Hospital at Denver announces a program of fellowships for postgraduate study in tuberculosis and allied diseases will be appointed for three month, six month, or one year periods

Information regarding the fellowships can be

obtained by writing to Dr Edgar Wiver, chairman, National Medical Advisory Board, National Jewish Hospital at Denver, 470 Park Avenue, New York City, or to Dr Allan Hurst, medical director, National Jewish Hospital at Denver, 3800 East Colfax Avenue, Denver 6, Colorado

## ALLERGIC REACTION TO PENICILLIN

## MAXWELL L GELFAND M.D New York

Bellevue Tosputal, Fourth Medical Division)

TOLIC symptoms following the use of penicillin have been observed by many who have employed the valuable antibiotic in a variety of clinical con ditions.1-7 Mild reactions, such as a transient urticaria\*3 to very severe alarming symptoms resembling anaphylactic shock appear in the volumi nous literature 19-12 on penicillin therapy and its reactions.

The following case is reported as one presenting many of the serious allergic reactions with favorable response to the withdrawal of the drug and the use of an antihistaminic preparation, pyribenzamine.

#### Case Report

Mrs. A. S. a white woman, aged 28 was admitted to the maternity ward of the Manhattan General flopital on December 24, 1946 in active labor She had a normal apontaneous delivery four hours On December 27 a rise in temperature to 102.4 F, without any untoward symposised to moted. Thorough physical examination failed to foodings. At 10 00 PM. of reveal any abnormal findings. At 10 00 PM. of the same day she was given 300 000 units of penicillin in beeswax, intramuscularly On the morning of the twenty-eighth her temperature was normal and the drug was discontinued.

That same evening a rise to 102 F was apparent again. The patient immediately received, intra muscularly, 50 000 units of sodium peniculin dussolved in physiologic saline and 30 000 units overy three hours thereafter On December 29 the patient complained of headache malaree myalgia, and intense itching over the face neck and body Edema of the dorsal surface of the hands, and pains in the wrists and ankles developed that night The following day constriction of the chest cough, and wheezing appeared. A complete gynecologic examination at this time failed to disclose any abnormalities,

On January 2, 1947 when first called to examine the patient I found her to be lethargic, listless, and complaining of sovere generalized myalgia, arthraigia of the wrate and ankles, and severe headache The following abnormal indings were present subconjunctival hemorrhages in the lateral margins of both eyes a diffuse maculopapular desquamat ing rath over the lateral aspects of the face, need chest trunk thighs, and legs, many rhonchi and sonorous and sibilant rales throughout the chest on susceptibilities. auscultation edema of the wrists, fingers, and ankles, particularly over the dorsal surfaces. There was no nuchal ngidity or other evidence of meningeal pritation. Her heart and abdomen were

negative and no adenopathy was discernible.

The blood count on December 27, 1946 revealed a red blood cell count of 3 750 000 and a hemogloban content of 78 per cent. The white cell count was 13 500 with 80 per cent polymorphonuclear leukocytes of which 10 per cent were nonegmented monocytes were 2 per cent and lymphocytes were 17 per cent. Urinalysis disclosed a specific gravity of 1 034 2 plus albumin, 1 plus sugar and the complete c augar and many rod blood cells with a few white blood corpuscles. A second blood count on January 2, 1047 showed the following red cells, 8 480,000

with 68 per cent hemoglobin content, white cells, 18 000 with 80 per cent polymorphonuclear leukocytes of which 6 per cent were nonsegmented, the monocytes were 2 per cent and lymphocytes were 18 per cent The urine examination on this day was normal.

The patient denied any past history of allergy drug reaction or idiosyncrasy and other than a past history of epidermophytoms of her toos, she had proviously enjoyed good health. She had no knowledge of ever receiving penicillin in any form. Her family history was negative to any of the known allergic diseases. Other drugs given in addition to penicillin were codeme aspirm and stilbestrol

The diagnosis of toxic reaction to penicillin was suspected from the history and physical examina-tion. The penicillin was stopped immediately and 150 mg of pyribenzamine in divided doses of 50 mg, were given daily improvement both objective and subjective was ordent in forty-eight hours. She continued to improve thereafter and was discharged on February 8 1947 six days after the cessation of the drug The desquamation of the skin and edema continued for two weeks after dis-Codeine charge and then cleared completely aspirin and stillbestrol were given again on the day before leaving the hospital without any ill effects.

Skin tests with sodium penicillin and molds were performed intradermally and the results appear in Tables 1 and 2 Passive transfer with the patient s serum was negative.

#### Comment

There is sufficient experimental and clinical evi dence to show that both commercial and crystellips penicilin have definite antigenic and allergenic properties.13 14 Whether it is due wholly or par tually to the impurities in the commercial product cannot be answered as yet However it is very evi dent that since improved technics of removing im purities from penicillin have been developed fewer reactions have been reported

Hypersensitivity to penicillin may manifest itself as an immediate or delayed reaction.4 Those who have a past history of exposure to penicillin will give an immediate reaction Delayed reactions are those in which allergic symptoms appear several hours to several days after contact with the allergen There are two types of such reactions, namely, (1) the inflammatory type, and (2) the delayed edema The delayed edema reaction gives negative direct and passive transfer skin reactions and is in no way related to serum disease 15

This patient manifested her symptoms twentyfour hours after the first injection of penicillin Because of this, and signs in which cdema was the outstanding feature, it falls in the class of delayed reaction of the edematous type The negative direct and indirect skin tests are in conformity with the expectancy in this type of reaction The previous trichophyton infection may have sensitized her tissues

Jadassohn, Schaaf, and Wohler, working with trichophytons by the Schultz-Dale technic, concluded that fungi have a common antigenic factor in addition to antigenic factors peculiar to each species 16 However, Feinberg found that patients sensitive to the spore penicillium did not give any positive skin reaction to penicillin 17

The additional medication did not in any way contribute to this reaction, as evidenced by the fact that the reintroduction of these drugs produced no The relief of the symptoms of untoward effect pruntus, myalgia, arthralgia, and edema was striking after the administration of pyribenzamine However, it should be noted that the improvement lasted only a few hours after each dose of medicament, hence the need for its daily use in divided dosage It is conceded that the withdrawal of penicillin is most important in controlling the allergic reaction

#### Summary

- 1' A case of postpartum fever treated with penicillin and developing an allergic reaction of the delayed edematous type is presented
- Severe symptoms of fever, headache, listlese ness, myalgia, arthralgia, desquamating skin rash, edema, bronchial asthin, and subconjunctival homorrhages, developing in a single patient, makes this case somewhat unusual
- Direct skin and passive transfer tests with penicillin were negative
- Relief was obtained after withdrawal of peni cillin and administration of pyribenzamine

## PROGRAM FOR A M A SESSION

The Council on Scientific Assembly of the A-MA has prepared the program for the interim session at Cleveland, January 5-8, 1948 There will be a full-scale scientific program especially designed for the general practitioner and an excellent program by the Congress on Industrial Health for physicians and others interested in industrial health

The general scientific meeting at Cleveland will include the following papers "Peptic Ulcer," Frank H Lahey, M D, Boston, "Recent Advances in Hematology," by Carl V Moore, M D, St Louis, and "The Chronic Invalid," by Edward L Bortz, MD, Philadelphia, president of the

The program also will include several panel dis-

cussions One deals with the care of posthospitalized patients with cancer Charles C Lund, M D.

Boston, is the moderator Another discussion will concern the treatment of the ambulators and hospitalized discharge and the concern that the concern the concern the treatment of the ambulators and hospitalized discharge and the concern that the care of posthospitalized posthospitaliz hospitalized diabetic patient, with Elhott P Joshn, MD, Boston, serving as moderator panel will be held on the treatment of pathologic disturbances of adolescence, with Joseph A John ston, MD, Detroit, as moderator A fourth panel discussion will deal with uterine hemorrhage Karl H Martzloff, M D, of Portland, Oregon, will be the moderator

A symposium on multiple injuries in automobile accidents also is planned, with Luke B Jackson,

M D, of San Antonio, presiding

#### SPONTANEOUS RUPTURE OF THE VENTRICULAR WALL WITH CARDIAC TAMPONADE FOLLOWING CORONARY OCCLUSION AND INFARCTION

WILLIAM B RAWLS, M.D., ROBERT A. O. CONNOR, M.D. and VINCENT A. NARDIBLIO JR., M.D., New York City

(From the Medical Services of St. Clare & Hospital)

ALTHOUGH 5 to 10 per cent of patients with myocardial infarction of major proportions are reported in the literature to have rupture of the ventucular wall, the diagnosis very seldom is made during life Further, we believe its occurrence within fifteen hours of occlusion is sufficiently rare to warrant report of this case

#### Case Report

8. K., a white woman aged 59 was admitted to St Clares Hospital at 6 00 PM on February 6 with the chief complaint of pain in the epigastrium of three hours duration At three o clock, while en route to the hospital to visit a friend the patient un to catch a trolley car and experienced sudden excudiating pain in the epigastrium. The pain was less intense a few minutes after boarding the car and she was able to continue the trip She was more comfortable after resting a short time in her Inends room, but suddenly while sitting quietly three hours later the pain became excruciating again, she was nauseated and vomited. She was sen immediately by an attending physician and put to bed. There was a history of gastric ulcer gallbladder disease and, recently, distress after eating fatty foods but no history of heart disease or pain prior to the experience described

Physical examination revealed an elderly woman who appeared to be acutely ill and in moderate shock with second-degree cyanosis of the lips. pulse was 95 and regular respirations 35 and tem-Perature 98.6 F The blood pressure was 170/110 The heart sounds were of fair quality nortic second sound was increased over the pulmonic second tound and there were no organic murmurs or thrills. On percussion the heart appeared to be enlarged. The radial arteries revealed third-degree arterioscleroes to be present. There was marked tender ness in the epigastric region with moderate splinting of the muscles.

Laboratory Data —Hemoglobin was 100 per cent erythrocytes were 5 100 000 leukocytes, 11 400 polymorphonuclears 85 per cent (all segmented), and lymphocytes, 16 per cent Urinalvais showed an acid reaction, with a specific gravity of 1019 a slight trace of albumin but no red blood cells, sugar of the control sight trace of albumin but no red blood cells, sugar or action. The electrocardiogram revealed sinus arrhythmia. The rate was 95 per minute, conduction times were normal. There were left axis deration small Q waves in lead I and large Q waves in lead IV. The RT segments appeared to be alightly elevated in lead I, depressed in leads II and III and high in lead IV (Fig. 1). After completion, the examinations, which re-

After completing the examinations, which required approximately one hour it was decided that we were dealing with a coronary occlusion. With bed rest aminophyllme morphine and oxygen the patient was quite comfortable and for eight hours appeared in fair condition Suddenly she became evanute and the suddenly she became cyanotic and very restless, the pulse rose to 120 and respirations to 45. The oxygen volume was increased and her condition was somewhat improved

the pulse decreased to 106 and respirations to 45 Three hours later there was a sudden return of the evancers and the patient became comatose with the radial pulse imperceptible and respirations labored. The heart sounds were audible but the rate was too rapid to count by stethoscope Intravenous aminophylline was given immediately and the oxygen was Increased to 16 L. per minute but ten minutes later the patient expired

Posimortem Examination —The heart weighed 890

The pericardial sac contained a small amount of dark fluid blood and large blood clots, dark red and jelly-like in appearance which weighed approximately 90 Gm. There was a mottled, hemor rhagic, softened area 41/2 cm by 3 cm. situated near the apex in the anterior wall of the left ven-There was a gray firm thrombus in the descending left coronary artery about 1 inch distal to the estium completely blocking the lumen. The right and left coronary arteries and right circumflex branch showed a moderate amount of arteriosclerosis but no evidence of any thrombi. The pulmonic and aortic valves were somewhat thick ened there were adhesions of the commissures and a moderate amount of arteriosclerosis in the region of the sinus of Valsalva. There was some thickening of the mitral valve edges and curling and thick ening of the chordec tendinene The lungs showed a moderate amount of congestion with no evidence of consolidation

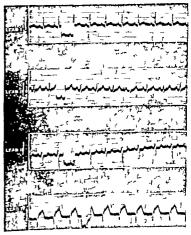

Fig 1

The gastrointestinal tract was normal The spleen weighed 250 Gm, its pulp was dark red on section and the malpighian bodies were visible. The kidneys weighed 320 Gm. The capsule stripped with ease, leaving a smooth surface on which there were several large retention cysts containing clear, straw-colored urine. The cortex and medulla were markedly congested with distinct markings. The mucosa of the pelvis and uterus was normal. The liver weighed 1700 Gm, the capsule was smooth and the edges sharp. On section it was reddish-brown and rubbery with no distinct markings. The gallbladder was distended, multiloculated, and contained dark-greenish, viscid bile and fifteen stones varying in size from 1/2 cm to 3 by 2 cm. The adrenals and pancreas were normal.

The anatomic diagnosis was (1) arteriosclerosis of the coronary arteries, (2) occlusion of left descending coronary artery with fresh infarction of the anterior wall of the left ventricle and minute spontaneous perforations, (3) hemopericardium, (4) tamponade of the heart, (5) generalized arteriosclerosis, congestion of the viscera, chololithiasis,

multiple retention cysts of both kidneys

### Discussion

In this instance we were faced with a problem in differential diagnosis in a patient, first seen when acutely ill, who had a past history of gastric ulcer and chololithiasis with a chief complaint of sudden, excruciating pain in the epigastric region. Possible diagnoses to be considered were coronary occlusion, ruptured gastric ulcer, chololithiasis, or ruptured gallbladder. She was treated as a possible coronary occlusion with the exception that morphine was not given until we believed we had eliminated the possibility of ruptured gastric ulcer or ruptured gallbladder.

Rupture of the ventricle is not too infrequent and the usual cause is arteriosclerosis of the coronary arteries leading to local necrosis and aneurysmal dilatation of the mycoardial wall. The rupture frequently occurs on the anterior wall of the left ventricle as in this case. Other etiologic factors may be syphilitic gummata or pyogenic abscess. Rupture of the ventricle generally occurs within the first two weeks or, most frequently, at the end of the first week after an occlusion and is a very rare occurrence on the first day. However, coronary occlusion may be comparatively asymptomatic at times, and there were no indicative symptoms in this case before the patient ran for the strecter fifteen hours before death.

Therefore, it is difficult to determine whether the excrtion described precipitated a coronary occlusion or rupture of the ventricular wall. If a silent occlusion had occurred previous to this episode, the rupture might have taken place when the first excruciating pain was experienced, and the tamponade effect prolonged life for fifteen hours On the other hand, if the occlusion occurred when she ran for the car, rupture of the ventricular wall may not have taken place until the attack of nausea and vomiting three hours later, and the tamponade effect then prolonged life for twelve hours A third possibility is that rupture occurred with the first circulatory failure which took place twelve hours after the original symptoms, and then the tamponade effect prolonged life for only three hours However, there were no symptoms to indicate that occlusion occurred before the original event described, and, if this be true, then rupture occurred within fifteen hours of occlusion, which is extremely rare

# COLUMBIA RECEIVES GRANTS FOR STUDY ON GLUTAMIC ACID

Columbia University has been awarded grants totaling \$39,000 from two New York foundations for further study on the use of glutamic acid, it was announced recently. Joint gifts of \$6,500 a year over a three year period were awarded the University by the Rockefeller Foundation and the New York Foundation.

Early this year, three Columbia University scientists reported that evidence exists that glutamic acid may in some cases boost the mental powers of children who have relatively high I Q 's, but who also have some organic difficulty such as anywhere days to prote the party of the control of

onvulsions due to petit mal, a form of epilepsy The foundations stipulated that the funds be d for work in brain chemistry, which will be carried on by Dr Heinrich Waelsch at the New York State Psychiatric Institute and Hospital

Dr Waelsch, attached to the department of biochemistry, Columbia University, College of Physicians and Surgeons, and other scientists at the University, have reported that extra amounts of glutamic acid—a substance produced by the human brain—may in some cases increase the mental and physical alertness of epileptic patients

It was pointed out, however, that the scientists are making no claims that they have found a brain food which can be given indiscriminately to raise a person's I Q. They explained that such treatment demands careful observation and management, with each case requiring special handling

#### CONFERENCES ON THERAPY

# DEPARTMENTS OF PHARMACOLOGY AND MEDICINE CORNELL UNIVERSITY MEDICAL COLLEGE AND THE NEW YORK HOSPITAL

THESE are stenographic reports of conferences by the members of the Departments of Pharmacology and of Medicine of Cornell University Medical College and New York Hospital with collaboration of other departments and institutions. The questions and discussions involve participation by members of the staff of the college and hospital students, and visitors. A selected group of these conferences is published in an annual volume Cornell Conferences on Therapy by the Mucmillan Company.

### An Optimal Routine for the Management of Congestive Failure

DR McKeen Cattell Today, an expert in the field of the management of heart disease will tell us how he treats congestive failure. The topic will be introduced by Dr Gold

Dr. Harry Gold In the past few years we have been pursuing a plan for the treatment of congestive failure, which seems to be yielding better results than any system in common we with which we are familiar. We now advocate this system for routine use and it seemed desirable to give it an airing in one of these conferences. I have discovered that this is not a bad way to learn something of the potentialities for survival of a therapoutic procedure.

The system consists of two parts—one, to abolish an attack of congestive failure and the other to establish an adequate plan to prevent its recurrence—In principle, we aim to establish in the patient with congestive failure a state which we term the dry weight. By this term, we mean a state in which the optimum amount of extracellular fluid remains

There are five cardinal points in the plan The patient is put at bed rest, or at rest in a chair depending on which seems preferable. The diet consists solely of four to six glasses of milk daily The patient receives at least two quarts of water daily, a glassful every two to three hours If the patient has not had digitalis recently he receives 1.2 mg of digitoxin or digitalin Nativelle at one time followed by 0.2 mg daily for maintenance. A dose of mercuhy dran is given intramuscularly and is repeated daily The course is guided by a record of the body weight. The patient is weighed before the treatment is started, then every day thereafter and the weight charted. This system is continued until all gross signs of edema disappear and the body weight reaches a resistant level below which it will not go with the continued use of the daily dose of the mer

The patient may now become ambulant and a plan is worked out for the purpose of mainte-

nance. In principle we do the following. We increase the diet, we make it more liberal so as to include practically all articles of food, withholding salt from the cooking and at the table. We con tinue the 0.2 mg, dose of digitorin daily free intake of water is also continued terval between the injections of the mercurial is now prolonged to every other day for three or four doses. If the daily weight continues to show a constant level, we increase the interval to every third day In this way we continue to prolong the interval until we find the longest interval between injections which is possible without an abrupt use of the body weight before the in section and without a conspicuous fall after the injection This establishes the maintenance interval and may be continued indefinitely the course of time, it often becomes possible or necessary to make further adjustments. The maintenance of the 'dry' body weight is the There are choices of maintenance plans.

This is the essence of the system we use. The secret of its success lies in the manner in which the details are carried out

Dn. Cattell. There are a number of experts here who are concerned with the treatment of heart disease. Perhaps we might first get their reaction to what has been said before opening the subject for general discussion. Dr. Eggleston, have you a comment?

Dr. Carr Eggleston I think the plan is in essence, a very satisfactory one I would raise one or two questions regarding the maintenance of "dry weight," or first as to the securing of a "dry weight." It has been my habit to come as close as I could to the 'dry weight' by the use of a regimen, not radically different from the one just discussed, but there are patients who experience a great deal of discomfort when they are reduced to the "dry weight." They complain rather bitterly of muscular pains and aches, or even of cramps and altogether they are pretty nearly

as uncomfortable at times as they were in the milder stages of their congestive heart failure I, therefore, question whether this regimen can be applied as successfully to all patients without considerable individual judgment as to modification from time to time with a little relaxation here, a little change there, in the plan of therapy. Of course, in essence the plan of therapy is presumptively correct, and I agree with the general thought behind it

I would like to ask Dr Gold what average doses of the mercurial he finds necessary, and whether he administers it intramuscularly or intrave-Does he make a choice between the two methods? His initial diet is, of course, only a slight modification of the Karell diet, which was essentially a salt-free diet It consists of 800 cc of milk per twenty-four hours Dr Gold raises that to a little higher level of milk and adds two quarts of water I think those of you who are not too familiar with the situation should recognize the fact that it is not the water but the sodium in the diet which counts in the retention of fluid in the tissues

I don't think this is the place to quibble over what is the correct therapeutic dose of digitovin The scheme of 1 2 mg as the initial dose, followed by 0.2 mg daily, works perfectly satisfactorily in a very large majority of the patients, but there are patients, small though the numbers may be, who will develop signs of digitalis intoxication on this regimen and the dose, therefore, will have to be adjusted to meet their needs You should remember that digitovin is retained long in the body and continues its action for a long period of time so that, while it is the most desirable agent for general therapy in the digitalis field, you cannot backtrack quite as quickly as you can with some of the more rapidly eliminated glycosides of the digitalis series

DR CATTELL There is one question I would like to ask Dr Gold, namely, whether you anticipate continuing the mercurial indefinitely in these cases after the congestive failure is relieved?

DR GOLD In answer to Dr Cattell, we do anticipate continuing the mercurial indefinitely. There are some in whom it may be discontinued after a time. There are others who continue to require a daily dose for the remainder of their lives. The system provides appropriate means for deciding how long the mercurial will be continued. The objective is always kept in mind, namely, to establish the "dry weight," and then, to maintain the "dry weight". After the "dry weight" has been established by the daily dose of the mercurial, the interval between doses is prolonged. In that process of gradually prolonging the interval we discover those cases who do not show a tendency to become "wet" even when months or

years clapse after the last injection of the mercurial, in the same way we also discover those who tend to become "wet" when the interval is only twenty-four hours, between these two extremes he the large numbers of patients in whom the permanent maintenance dose of the mercurial is necessary at any one of a wide variety of intervals, determined for each case individually

In regard to the discomfort resulting from the "dry weight." Dr Eggleston, I should mention again our definition of the "dry weight" It is that state in which the optimum amount of extricellular fluid remains in the body Such a state does not produce discomforts Perhaps a more satisfactory term would be "optimum weight" rather than "dry weight" The reason we have avoided the term "optimum weight" is the fact that it is difficult to define a method for arriving When the system is started, the patient begins to lose weight and, after several days to a week or two, in which the mercurial injection is given daily, the losing of weight comes to a fairly This is a sharp endpoint abrupt end majority of patients feel at their best when this point is reached, a few show undue weakness, muscular cramps, and other unpleasant symptoms which indicate excessive dehydration them to gain a pound or two and they feel better at this higher level We have observed that the production of unpleasant symptoms during the course of dehydration quite frequently is related to the speed with which it is carried out In general, the system should so be adjusted as to avoid a loss of more than 2 or 3 pounds per day, although I am sure that you have observed many patients in whom a loss of 5 pounds or more per dry was tolerated without discomfort to regulate the speed of dehydration, and thereby control unpleasant reactions, by adjusting the daily dose of the mercurial Obviously, the smaller the dose the smaller the diuretic effect

As to your question concerning the dose of the mercurial, we usually start with 0.5 cc mercuhydrin. If this causes no unpleasant reactions due to allergy or to excessive weight loss, and the diuresis is adequate, a weight loss of 2 or 3 pounds, we continue that dose daily. If the diuresis is inadequate, we increase the dose to 1 cc or 2 cc daily in the endeavor to secure a continuous weight loss of 2 or 3 pounds a day. In a few cases we have had to increase the dose to 2 cc every twelve hours in order to establish adequate diuresis. The system is sufficiently flexible to take care of the major varieties of unusual sensitivity or tolerance to the drug

Our routine plan calls for the intramuscular injection If, for some reason, that method is not feasible, we give it intravenously It is safer by intramuscular injection

You are quite right in your statement that our diet is essentially a Karell diet. Perhaps I should distinguish the important from the unimportant ameets of it It rarely matters whether the pa tient receives 800 cc of milk or 1 000, or even The point of importance is that 1 500 cc. a day such a diet insures against the patient receiving more than from 1 to 1.5 Gm. salt per day is the simplest form of a light diet to achieve that end and it makes the least demands on the dietary service of the hospital It is also the least trou blesome in the home I should not be so much concerned with the problem of making things easy for those who look after the patient with con gestive failure, if it were not for the fact that lapses are so frequent when diets more trou blesome to arrange are prescribed The so-called low-salt diets of hospitals contain from 3 to 6 Gm of salt, and not infrequently, the salteellar appears on the tray by mustake. Such diets are also relatively inflexible, if the salt content turns out to be too high as seen by the failure of the patient to respond satisfactorily it is often extremely difficult to have it properly rearranged course, if the patient shows some form of intol erance to milk there is no choice but to arrange a different type of dict containing from 1 to 1.5 Gm. of salt We might bear in mind the fact that it is rarely necessary to continue such a low-salt diet as is represented by the milk alone for more than about a week, and most patients will cooperate satisfactorily for this relatively brief period of time

Dr Egglesten, you stated that you use essentially the same kind of system Do you give the mercural diuretic every day?

Dr. Egginstov I do use the mercurials daily where necessary and have done so for a consider able time. I have never seen any detriment to the patient from their use in this way

Dr. Gold I am glad to hear you say that I would only point out that our system calls for the routine use of the daily dose of the mercurial to abolish the attack of congestive failure rather than in some special cases as implied by your term "where necessary" It is our view that in every case of congestive failure dehydration is an esential feature of the therapy, and that this should be carned out with the greatest expedition consistent with safety and comfort. We have taken the position that, even though complete reversal of the state of congestive failure is possible, in many cases with digitalis alone, or with digi talm together with salt restriction and the dose of the mercural every third or fourth day it takes unnecessarily long to accomplish the results, and that the daily administration of the mercurial in every one of these cases results in a curtailment of the period of disability Accelerating the speed of recovery without adding discomforts or dangers can be advantageous only

DR EGGLESTON May I add that I spoke of the discomfort of the patient during the use of the mercurial for the purpose of making you discuss it a little more because it is a very real factor and can become very troublesome unless one is can tious in guiding the course of dehydration of the nationt

DR CATTELL Dr Stewart, would you care to comment at this point?

DR HAROLD J STEWART I think the daily use of the mercurial is about the only thing new in this regimen which Dr Gold has described Everybody I think, who has been taking care of patients with heart failure, has been weighing them every day, so that is not a new procedure. Some have been using small amounts of fluid. others, large amounts. Many have been using The only new point is that he advocates the use of daily injections of the mercurial have not been able to get nationts free of heart failure with the use of unlimited amounts of fluid as has been recommended by Schemm placed a series of patients on an accurately con trolled low-salt intake and forced fluids in none were we able to abolish the heart failure even when we added the mercurials. For the most part I still use limited fluids and a low-salt intake

I wonder whether Dr Eggleston's experience with digitorin has changed since last year think I remember his saving at a conference last year that he used more than 1.2 mg of digitalin Nativelle to digitalize patients adequately

I said that most of the pa Dr Eggleston tients required more than that for full digitali

DR. STEWART In our experience, it has taken from 1 5 to 20 mg

DR. CATTELL In one dose?

DR. STEWART We gave it to a few patients in a single dose but we don't advocate that.

DR CATTELL Dr Gold you have had some ex perience with the single dose of 2.0 mg happens?

DR GOLD It is much too large for routine single dose digitalization We gave 20 mg of digitalin Nativelle at one time to a group of patients and about one third of them developed toxic effects.

DR. CATTELL Have you any further remarks on Dr Stewart a comments?

DR. GOLD I agree with Dr Stewart s view that the individual items involved in our plan of treatment of congestive failure are not new Water milk, salt restriction, digitalis, mercurial diu retics, and weighing of the patient have all been used by others. I must confess that I know of no writings other than our own advocating the rou-

the mercurial diuretics in ambulant patients with heart failure is at least as important as the continued use of digitalis. In the case of digitalis, we continue a daily dose indefinitely case of the mercurial diuretic, a large proportion of patients also need it indefinitely. Only a few require it daily In the majority, longer intervals The interval is determined in every case by first reducing the patient to the "dry weight" by daily doses, and then finding the longest interval between injections which enables him to maintain the "dry weight" The arbitrary maintenance plans of two injections a week or one in two weeks, or an injection when symptoms return, are deplorable

DR CATTELL Do you consider that the continual use of the mercurial diuretic actually prevents the patient from going into congestive failure?

DR GOLD That is precisely the case The size of the doses and the intervals between them are correct when they maintain such a urine flow as to prevent any conspicuous fluctuations in the body weight The maintenance interval is too long if the injection makes the patient lose a few pounds In that event, the interval should be shortened so that the patient loses almost no weight on the day of the injection The chief mechanism in the clinical state of congestive failure is a disorder of salt and water metabolism leading to tissue hyperhydration A plan of therapy which provides continuous dehydration keeps these patients free of the signs and symptoms of congestive failure

DR MODELL I should like to ask Dr Gold what he means by congestive failure Does he apply this regimen only to patients who show one or more of such signs as pitting edema of the extremities, enlarged liver, pulmonary rales, ascites, or hydrothora?

DR GOLD We do not have an entirely satisfactory definition of congestive failure tempt at a definition may be made either in clinical terms or in terms of mechanism pear to be a number of mechanisms involved. such as diminished contractile power of the heart, high venous pressure, increased blood volume, a disturbance in salt and water metabolism, and The factor which seems to be present in practically all cases is the retention of salt and I find it most useful to formulate congestive failure as a clinical state involving a disturbance in salt and water metabolism leading to tissue hyperhydration, occurring most commonly in chronic heart disease, and resulting usually from a chronic circulatory disorder in the pulmonary or systemic circuit It is most important to bear in mind that increased wetness of the tissues occurs long before the appearance of the signs

Accordingly, a patient which you mentioned may have congestive failure without pitting of the extremities, or enlarged liver, or pulmonary rales, or ascites, or hydrotho-Shortness of breath is an important symptom of congestive failure. It may be present without any of the other demonstrable signs of increased wetness of the tissues In fact, some of the most severe and disabling instances of congestive failure involve only shortness of breath as evidence of congestive failure We should remember that interstitial edema of the lungs may not give rise to any rales yet such patients may he completely incapacitated by dyspnea or or-The system of dehydration which we have outlined provides such patients with complete relief I might call your attention to a most striking case of that kind which we encountered recently The patient had hypertensive and arteriosclerotic heart disease with a massive heart and a gallop rhythm complaint was shortness of breath This had progressed to a point at which he was unable to be down because of the extreme orthopnea and Cheyne-Stokes' respiration He had been receiving oxygen, digitalis, intravenous aminophylline, and restricted fluids Since there were none of the frank signs of edema, no rales, no enlargement of the liver, and no edema of the legs, the mercurial diuretics had been withheld went from bad to worse, and at the time we saw him, it looked as if he would hardly survive the He was promptly placed on the regimen of treatment which we have already outlined, a daily dose of the mercurial, six glasses of milk daily as the sole diet, and 3,000 to 4,000 cc of He lost 14 pounds in four days, and on the seventh day was discharged from the hospital almost completely free of symptoms Here was at least 14 pounds of extra fluid which failed to produce any of the standard signs of edema It was found necessary in this case to use a dose of the mercurial every other day for maintenance Several months later, he was still up and about, working, and substantially free of symptoms

There are other cases in which the presenting symptom of congestive failure is cardiac pain. Some patients who are troubled with the angina decibutus, attacks of cardiac pain appearing usually at night, awakening them after they have been asleep a few hours, are completely relieved by the system of dehydration which we have described. This also applies to patients who show none of the standard signs of edema, and are able to carry on fairly active work during the day, but are subject to attacks of pulmonary edema at night. The application of the regimen which we have described to establish their "dry weight" and to maintain the "dry weight" by suitable ad-

justment in the regimen, renders them free of at-

DR. STEWART In our cardiac clinic we have many patients who come in one, two, or three times a week for their mercurial injections, as required for each patient to maintain freedom from heart failure as estimated by their physical signs and change in weight. Some of them have been on such a regimen for seven or eight years, or longer. I had not realized that weighing patients was not a common practice in taking care of them as it is in our clinic at the New York Hospital.

Dr. Eggleston I don't think that weighing the patients is a common or a prevident practice, but it is certainly a custom in our clinic, and they do very well.

I would like to ask Dr Gold how much difficulty he encounters in bringing these patients under control when they refuse hospitalization

der control when they refuse hospitalization DR. GOLD Sometimes a great deal of difficulty, other times very little This system is perfectly easy to carry out at home You do not need a doctor for the injections Let the patient stay home and rest in a chair Let him take four to six glasses of milk daily and a glass of water every two to three hours Have a nurse administer the intramuscular injection of the mercurial It might be well to explore the thighs and arms for suitable places for relatively painless injections If a nurse is not available the patient or a mem ber of the family may be taught to make the injections The problem is similar to that of in sulin and diet in diabetes There the patient is instructed in matters of diet, injections and exammination of the urine. We would never have achieved the successful treatment of diabetes if a physician or nurse or hospital were necessary for the treatment. The same is true of congestive The successful control of congestive failure requires that the patient or a member of the family be instructed in the arrangement of low-salt diet, in the technic of the mercural in jections, and in the keeping of a chart of the daily weight But before that can be accomplished, physicians must begin to think in these terms.

Dn. Stewart Dr Gold I was not aware that doctors taking care of patients with heart failure did not discuss with the patient or a member of his family how to prepare a salt poor or salt-free diet maintenance of body weight etc. This has long been my own practice and the custom in our clinic

Dr. Eggleston Dr Gold do you trust the home scales?

Dr. Gold No Have them procure a new one The greatest trouble is with the hospital scales They are often so inaccurate and so inaccessible and to procure a new one in the bospital is not ways so simple a matter I should like to say a word about a point which Dr Pardee raised, namely, the duration of the treatment with the milk diet. It is not long In a recent study of ours on 140 admissions for advanced congestive failure, the average time from the day of admission to the achievement of the 'dry weight' was approximately six days. In a series of 502 admissions of similar cases in four large hospitals of New York City treated by other methods in current use the average time required to achieve the same results was approximately fifteen days.

I may also say a word about Dr Stewart's comment to the effect that it is common practice for the patients in his clinic to receive one or two injections of the mercurial a week. It may be that these patients are doing as well as is possible but from the experiences in our clinics with a rela tayely fixed system of mercurial injections I would suspect that many of them are being main tained as partial cripples always on the border of congestive failure less dysphere on the first day or two after the injection than on the day before the next injection. That is not satisfactory maintenance. The best results require an initial penod of treatment in which the weight is reduced to the "dry level" by the daily dose of the mer curial in addition to the other elements of the regimen which we have described followed by a period of adjustment in the regimen so as to discover the most liberal diet and the longest inter val between injections which suffices to maintain the 'dry weight" The maintenance plan will differ from case to case one patient requiring an injection every day, and another being able to maintain a 'dry weight" with an injection once a week, or once in 2 weeks, or even longer course, thus is very difficult to do in the way in which the average outpatient department is That is why I urge that the patient operated be instructed in the technics of this treatment to make him independent of a visit to the clinic for most of the injections Again, the problem of treating congestive failure is essentially the same as that of diabetes.

DR. CATTELL Dr Leiter of the Monteflore Hospital is here today He has been engaged in the study of the problems of congestive failure We all would appreciate a few comments from him.

Dr. Louis Leiter At the Montefiore Hospital we deal largely with chronic congestive failure I think we all agree that Dr. Gold's system is perfectly satisfactory in its general principles for the management of congestive failure in the acute phase. It is easy to obtain the patient's cooperation at this time. The patient is very ill he is exaping for breath, and he has little desure for Little difficulty is encountered in

such a patient on a diet of milk The real difficulty, however, as Dr Gold and others have intimated, arises when the patient becomes convalescent and faces the problem of continued invalidism in the form of chronic congestive failure Now the matter of an adequate diet which the prtient is willing to continue to take becomes a problem of paramount importance We question the use of the milk diet by itself at the beginning because in the next ten or fifteen years of the patient's life, we shall have to be struggling with suitable diets which contain little or no milk Might it not be wiser to begin treatment with mixed and adequate diets low in sodium rather than with milk alone? The injection of three or more doses of the mercurial a week, furthermore, is a very troublesome business. It is all very well when the physician can go to the prtient's home or when a competent nurse can be used for the It is quite another matter in a large clinic to which patients may have to come in the There is the considerable physical evertion and the difficulty of transportation

As we looked into the matter, we found that the poor results obtained by patients even in the hands of very competent physicians who made use of digitalis, the mercurials, and other items of treatment were due chiefly to improper diet. The liberal diet seemed to be the chief reason for the frequent readmissions to our hospital. We found that by means of a diet containing only 1 or 1 5 or 2 Gm. of salt, usually less than 1 Gm of sodium, these patients could be maintained satisfactorily. Most of them reach a point at which they require a mercurial injection only once in two to four weeks.

two to four weeks The reason for this situation is simple The patient with congestive heart failure has a glomerular filtration rate well below the normal, but good tubular reabsorption of salt Therefore, if his diet contains 4 or 5 Gm. of salt daily, and he excretes only 2 Gm because of his reduced filtration rate, it is obvious that he will put on a kilogram of edema fluid every three days fore, would require one or two mercurial injections a week to be comfortable I should like to place the greatest emphasis on the matter of training patients to use the proper diet course, there still remain the cases with cardiac cirrhosis and ascites, and those with pleural and pericardial effusions, who may need more frequent injections of the mercurials or may need to be tapped from time to time There also remain the cases of severe undernutration, which present special problems One of the greatest problems in the management of chronic congestive failure is the prevention of undernutrition for one, do not believe in allowing a patient a diet

fairly liberal in salt, and then controlling the con-

gestive failure by several doses of the mercunal a week. I do not believe it is a satisfactory means of preventing what eventually will become a state of severe undernutration. We see many patients with congestive failure whose undernutration as the result of cardiac management is as severe as any encountered in the concentration camps.

At this point, I would like to ask Dr Gold how he can tell, in connection with the establishment of the "dry weight," whether a slow decline in the base-line of the weight is due to loss of cellular fluid or to undernutration Dr Stewart I wonder if Dr Deitrick is here

to say something about the ill effects of the duly dose of the mercurials

DR CAPTELL Unfortunately, Dr Deitrick is not here. We were discussing the matter of the

dangers of the mercurials yesterday We brought up the attitude of some of the people in New Haven where the mercurials are considered only as a last resort in the treatment of congestive failure on account of the risk of renal injury. I am afruid we will not have time for much more general discussion

DR NATHANIEL T KWIT Would Dr Gold

comment on the importance of making sure that the patient does not consume sodium in the form of medications which might be prescribed? DR GOLD That is an important point Attention has been called by several writers

to the need for insuring that the patient

does not receive the rhubarb and soda mixture, or other sodium containing antacids for indigestion, or large doses of sodium bromide for sedition Not so long ago we were engaged here at this hospital in the treatment of a rheumatic patient with advanced congestive failure, who failed to respond and whose congestion continued to in-We then discovered that the patient had received about 50 Gm of sodium bicarbonate in the form of Sippy tablets during a period of about eleven days in which the course was progressively The congestive failure cleared drimatically as soon as these were discontinued and the proper regimen involving milk, abundant water, and daily doses of the mercural was instituted DR MODELL Dr Gold, you stated that by

DR MODELL Dr Gold, you stated that by the method of treatment of congestive failure, which you outlined, you achieve the "dry weight" in an average of six days, while it takes about fifteen days to produce the same results in similar cases with the methods in current use. Is that the only advantage of the method, the saving of some days? Why the hurry, since these are pretty ill patients and are likely to have to be laid up for some time even after they reach their "dry weight?"

Dr. Gold There are, in fact, other advantages besides the saving of time. The regimen I descaled resulted in complete disappearance of congetive failure in 90 per cent of the group of 140 almissions treated in that way, as against only about 50 per cent of the 502 admissions of similar cases treated by the methods in current use which involve mixed so-called low-ealt hospital diets water restriction, orni diuretics occasional doses of the mercurial at infrequent intervals and with out the use of the weight chart as a guide these methods of treatment, about one third of the patients are discharged from the hospital with only moderate relief of the congestive failure This type of result has practically vanished in the treatment by the regimen which I described To this new regimen, there are a few advanced cases of congestive failure who show no response or at most a negligible one, while in the remainder the relief of the signs and symptoms of congestive failure is complete. The new regimen should also eliminate the largest proportion of cases of readmission for congestive failure thermore, I do not believe one can minimize the importance of the time factor alone the reduction of the period of complete disability in congestive failure to nearly one third of the usual period. A very strong case has been made out in rerent years for the advantages of early ambu lation There is little doubt that the curtailment of the complete rest period from an average of fifteen days to six days will show itself up in the form of a reduced meidence of venous thrombosus in the legs and pulmonary embolus sider also the diminished burden on the nursing staff Some of us might be interested in the economic aspect on the basis of about 1 000 000 patients suffering with congestive failure in the United States, the new regimen involves a poten tial saving of about \$50 000 000 per year in hospital care

Dr. Catrett. Dr Gold would you close the decusion\*

Dr. Gold With respect to renal damage I am quite certain that the risk is negligible with the doses used in this regimen. Sometimes the blood NPV ries. The mechanism of the rise is in need of further study. The important point is that it appears to be a completely revisible action in much the same way as the therapeutic action on the renal tubules to impair the realisorption of sodium. There are many unpleasant symptoms which result from arcessive loss of base and excessive dehydration but there is very little excuse for these because it is merely a matter of dosage of the mercural and with proper adjustment of the dose, these effects should occur rarely.

As to your question Dr Leiter, regarding the

matter of distinguishing a falling weight-curve due to undemutrition from one due to loss of fluid I would say that we have encountered that rarely. The problem which we encounter quite frequently is the reverse namely, that of distinguishing a rising weight-curve due to good body tissue from that due to accumulating edema fluid. We resolve that easily by a few extra daily doses of the mercurial during the maintenance period if these cause an abrupt fall in the weight-curve it is clearly an increase of edema fluid and not good body, weight

I do not believe there is any escential dwagreement between Dr Leiter's view and our own regarding the management of congestive failure He emphasizes the aspect of low-salt diet as a means of maintaining the dry weight and we place more emphasis on the use of the organic Neither of us it seems to me neglects either of the factors I know that the I to 15 L. of milk daily is not an adequate diet but then we use that diet for only a period of a week or Our muntenance diet is a mixed one and adequate from the standpoint of vitamins types of foods and calones. Our regimen therefore rarely gives use to a state of undernutration except in so far as the advanced disease with disturbed liver function makes it impossible for the patient to maintain a satisfactory nutritional state regardless of the food that is given

I gather Dr. Leiter pursues the practice of providing the patients with a high coloris diet con taining only 1 to 1 5 Gm. of salt during the years of maintenance and in that way finds it possible to keep the patient 'dry with only an occasional dose of the mercural diurotic We have several diets representing about 2 000 calones and only about 1 Gm. or less of salt The list looks quite impressive but the food is anything but pala Some patients, during the long period of maintenance prefer that diet together with an in frequent dose of the mercurial but others prefer a more palatable diet containing more salt, even if it entails the more frequent use of the mercural It seems to me chiefly a question of the patient s preference and the ease with which the 'dry weight can be maintained by one or the other I doubt that we have any evidence for a choice between the two from the standpoint of the patient's nutritional state as long as we are able to maintain the patient in the dry' state with either method I think that there is here also an analogy between diabetes and congestive Is it better to maintain the diabetic putient on a highly restricted diet with little or no insulin or on a more liberal diet with more in sulin? A similar question may be asked in relation to congestive failure. Is it better to maintain the patient in the dry state with a

highly restricted diet containing only 1 to 15 Gm of salt, using only an occasional dose of the mercurial, or with a more liberal and more palatable diet, using a more frequent dose of the mercurial? We prefer the latter

## Summary

DR GOLD In the conference this afternoon a new regimen was described for the treatment of It involves no new principles congestive failure and no new drugs It is essentially a new design for putting the well-known factors into a highly effective system for routine use It provides not only for abolishing the signs and symptoms of congestive failure with the greatest expedition and in the largest number, but also for the maintenance of the gains and the prevention of recur-It is applicable not only to patients with advanced failure with pitting edema, enlarged liver, pulmonary rales, and effusions, but also to the large group of ambulant cardiac patients with only shortness of breath on exertion, orthopnea, attacks of cardiac asthma or cardiac pain, or attacks of pulmonary edema The regimen may be applied conveniently both in the hospital and in the home It requires a minimum of nursing and medical supervision

Dehydration is the primary factor in this system of treatment. There are five cardinal ele-

ments involving the simultaneous use of digretoxin, the mercurial diuretic, salt restriction, abundant water, and the guiding of the course by a chart of the patient's daily weight, which must be followed in this system. The maintenance plan consists of the same elements, adjusted to meet the requirements of the individual patient.

Emphasis was placed on the use of a daily dose of the mercurial to bring an attack of congestive failure under control, and on the maintenance dose of the mercurial at suitable intervals in order to prevent the recurrence of congestive failure. The use of a chart of the daily weight was stressed as in essential guide to the proper care of the patient with congestive failure. Attention was called to the similarity between the problem of treatment of diabetes with diet, injections of insulin, and urine examinations, and the problem of treatment of congestive failure with diet, injections of the mercurial diuretic, and a chart of the daily weight as a guide.

The most interesting feature of the conference lies in the searching questions concerning the proposed regimen raised by members of the audience expert in the management of heart disease. These provided an opportunity to explore the mechanism of congestive failure, and the reasons for the various factors in the proposed regimen of treatment.

#### THE VERMIN-KILLER

- Just

Many interesting and unusual ideas may be learned from the perusal of THE VERMIN-KILLER Being a complete and necessary Family-Book, published in London in the eighteenth century. This little book, in the collection of the History of Medicine Division, tells the reader such things as how to kill fleas, how to buy a horse, the best cure for colic, and rules to "judge the weather"

The following are a few choice items

"Recipe for the Bite of a mad Dog, taken out of Cathorp Church in Lincolnshire, in which it was solemnly recorded for the perpetual Memory of the Thing, that the whole Town almost being bitten, not one Person miscarried, but was cured, who took this Method

"Take the Leaves of Rue pick'd from the Stalks, and bruised, six ounces, Garlick pick'd from the

Stalks and bruised, Venice-Treacle or Mithridate, and Scrapings of Pewter, of each four Ounces, boil all these over a slow Fire in two Quarts of Ale till one Pint is consumed, keep it in a Bottle close stopped, and give of it nine Spoonfuls warm to the Person seven Mornings successively, and six to a Dog , apply some of the Ingredients to the Part bitten

"I'ov

"Anoint the Soals of Fat a little broiled." here and there in Honey, draw follow you, so Medical Libr

#### ABSTRACT OF MINUTES OF THE COUNCIL OF THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

AT ITS meeting on November 13 1947 the Council considered various matters, taking final action or directing further study and reports as indicated under the following headings

#### Secretary's Report

Remission of State Assessments -- Remission of State assessments was voted on account of service with the armed forces for 3 members for 1947 and 9 for 1946, also on account of illness for Drs. Henry Almour William Murray Ennis and George Lowes

Hagman

Mertings—I our Secretary has attended four District Branch meetings at Norwich, Liberty, Garden City and the Bronx, since the last Council meeting On October 20 with Dr Robert R Hannon I represented the Society in Albany, at a subble bearing of the atmospher Rights commission to public hearing of the temporary State commission to study the question of establishing a New York State University After conferring with Dr Hannon and other members of the Society I presented the point of view that there is no need of another medical college in New York State at this time Rappleye Wenkotten, and McFwen also testified

On October 24, I attended a hearing of the New lork City Health Department regarding the use of

fluoroscopes by shot salesmen

The annual meeting of County Medical Secre-tance was held at the Hotel Ten Evek Albany, Wednesday November 5 It was well attended and the program seemed to evince interest night your Secretary went to Chicago when he attended the American Medical Association con ference regarding civilian medical services for voterans service-connected desabilities Dr Herbert

H Bauckus also represented Veterans Viducal Service Plan of New York, Inc., at this meeting On November 7 and 8, in Chicago your Secretary attended the annual Conference of State Secretaries and Editors where I had the honor of acting as moderator at a panel ducussion regarding federal

and state legulation.

It has also been my privilege to answer correspondence and attend Committee meetings

Deaths.—It is with sadness that I report to you the death of Dr Frederic E Sondern, past president of the Medical Society of the State of New York on October 10, 1947 With the approval of Dr. Bauer notices of Dr Sondern a death were inserted for the Soriety in the New York Herald Tribune Times, Sun and World Telegram I also sont a telegram of sympathy in the name of the Society to Mrs. Son dern and dispatched flowers to the funeral which I attended on October 13

On October 15 a telegram of sympathy was sent to Mrs Alfred I Madden past preadent of the Woman's Auxiliary of the Medical Society of the State of New York, because her husband had ded

\*uddenly

Nominations to Nurse Admsory Council of New 1 ork State Education Department - Miss Clara Quereau, secretary Board of Examiners of Nurses, has requested two nominations from this Council for membership on the Nurse Advisory Council of the New York State Education Department, because Dr Norman S Moore a membership will terminate at the end of this year Dr Moore has signified his will need to be a like the willingness to accept a renomination I take the liberty of suggesting that you advance the name of

Dr W Guernsey Frey, Jr as an additional candi date for the Board of Regents to consider

It was roled that the Council recommend to the Board of Regents, for membership on Nurso Advisory Council of the New York State Education Department, the names of Dr Norman S Moore

and Dr W Guernsey Frey, Jr Appointment to New York State High School Athletic Protection Plan, Inc.—Dr Herbert L. Bauckus has been a member of the board of directors of this Plan for several years and he would like to be

replaced

The Council roted to recommend to Dr. Bauckus that he suggest the name of Dr Kenneth Horton Rockville Centre Long Island as his successor Representations from Adjoining States to Annual

Meeting

It was roted to invite representatives of the Medical Societies of the states of New Jersey Pennsyl vania, Connecti ut, and Vermont to our Annual Meeting

Communications -1 Letter from Dr Joseph J Witt 258 Genesce Street Utien, New York, dated November 4, 1947 requesting proposal to the Council that they recommend to the House of Delegates that the Session on Chest Diseases be

changed to a Section on Chest Diseases

After discussion at was roted that the Council in its annual report to the House of Delegates

will so recommend

Letter from California Medical Association and resolution adopted by their Council on Septem ber 21 1947 regarding blood banks

After discussion it was roted to refer this to the Committee on Public Health and Education Dr. O W II Mitchell chairman for recommendation

Letter from the Namau County Medical Socoty dated October 10 1947 requesting that Doctor Hobart S Van Nostrand be permitted to remain a member in the Nassau County Society although his office and residence are one block inside the Queens County line

After discussion, it was roted that Dr Van Nostrand's request be granted as permitted by

the Bylaws.

4 Letter from Dr Malcolm Buchanan, 115 Winthrop Street, Watertown New York, dated October 14 1947 requesting a life memberahip button from the Medical Society of the State of New York for retired members

It was roted to refer this to the Bureau of

Public Relations

o Letter from Kings County Medical Society, dated October 16 1947 requesting clarification of questions relating to membership

After discussion it was roted that Kings County he advised that each such question should be

referred to the Council for consideration

Letter from Dr B Wallace Hamilton secretary of the Modical Society of the County of New York under date of October 21, 1947 submitting a resolution passed by the New York County Society which advocates establishing a special type of membership in the American Medical Association

After discussion at was roted that the Medical Society of the County of New 1 ork be informed that their delegates may introduce such a resolu-tion in the House of Delegates of the Medical bociety of the State of New York next May

Treasurer's Report was accepted

### Report of Executive Officer

Hannon reported verbally that the last district meeting was held October 30 He also attended the public hearing, mentioned by the Secretary, as to the need of a University of the State of New York, in Albany on October 20

The Executive Officer, with Dr Maurice J Dattelbaum, chairman of the Committee on Cults, visited the First Institute of Podiatry, interviewed its president and some members of the staff and in-

spected the institution

On November 5 the Secretaries' Conference was

hold in Albany

A meeting of the Legislative Committee was held in New York on November 12, to plan for legisla-

#### Activities of Committees

Constitution and Bylaws -Dr James R Reuling, chairman, reported that the Medical Society of the County of Albany requested approval of a change in their Bylans This approval was voted

Convention —Dr Harry Aranow, chairman, reported that there had be n a meeting of the Committee and that most of the annual meeting programs of sections and sessions have been prepared

Economics —The following report of the Director of the Bureau of Medical Care Insurance was sub-

mitted

October 7, 1947 Mr Farrell conferred with Dr Aaron, chairman of the Subcommittee on Medical Care Insurance, in Buffalo, to discuss the Committee's program for the coming year. The projects

contemplated were

Survey of doctors and members in each plan area by personal interview, to determine physician and member reactions to the plans, letters to be sent in advance of each interview The Chairman feels information so obtained will be helpful in clarifying misunderstandings which now exist between doctors and the plans and will improve public relations. In addition the Bureau will be able to evaluate the type of contract moet suitable on a state-wide basis

Survey of county medical societics which have not given approval to their local medical care plan, the Bureau to offer its services to correct misconceptions and obtain possible

Contact each county medical society which has an official publication, to ascertain if space would be given for information about the medical care plan operating in its area, material to clear

through the Bureau

Develop periodically an informative folder showing progress of plans throughout the State to be distributed to members of the Society, the cost to be met by each plan in proportion to the num-

ber of folders required
October 9, 1947 Mr Farrell met Dr Leon M Roe
and Dr Arthur J Karl, members of a special committee of Steuben County Medical Society, in Canisteo, to consider affiliation in a medical care As a result of this conference, recommendations will be presented at the next meeting of the Steuben County Medical Society Mr Farrell has offered to appear at this meeting, if requested

The Director of the Bureau attended the following District Branch meetings October 16, Third District at Ferndale, October 29, Second District at Garden City, and October 30, First District at the Veterans Administration Hospital, New York City

At the Fourth District Branch meeting at Amster-im Mr Farrell presented a paper on "Piesent

Status and Future of Medical Care Insurance in New York State "

Mr Farrell attended the annual conference of Secretaries of County Medical Societies in Albany, November 5, 1947

Ethics —Dr Reuling, chairman, reported he had received a letter from Dr Fred H Voss, secretar, of the Medical Society of the County of Ulster, re questing a ruling on carrying box advertisements in the local papers

After discussion, it was voted that it is unethical

to print box advertisements

Finance Committee -Dr Albert F R Andresen, chairman, presented the proposed tentative budget for the year 1948

After discussion, it was voted that the budget be referred to the Board of Trustees for preliminary consideration, and that final action of the Coun cıl be taken in December

Public Health and Education -Dr O W 11

Mitchell, chairman, reported as follows

October 18, 1947 In New York City attended a
meeting of Convention Committee

October 21, 1947 In New York City a meeting of
the Council Committee on Public Health and Education and the Subcommittees on Maternal and Child Welfare was held. In addition to members of these committees, officers of the Medical Society of the State of New York and representatives of the New York State Department of Health were present

November 5, 1947 Chairman addressed the ion ference of Secretaries of County Medical Societies in Albany regarding activities of the Council Committee on Public Health and Education

November 12, 1947 Chairman attended the meeting of the Subcommittee on Cults held in New York

City

November 12, 1947 In New York City a meeting of the Council Committee on Public Health and Education and the subcommittee on Child Welfare was held for the further discussion of pediatric con sultation services and the proposed regulation for the control of diarrhea in prematures. Some of the officers of the Medical Society of the State of New York and representatives of the State Department of Health were present

Subcommittee on 4-H Clubs and Youth Health Activities—Dr J G Fred Hiss, chairman, reports "On October 14, 1947, your Chairman attended a meeting of the New York State 4-II Health Committee of the New York State 4-II Health Committee of the New York State 4-II Health Committee of the Mental New York State 4-II Health Committee of the Mental New York State 4-II Health Committee of the Mental New York State 4-II Health Committee of the Mental New York State 4-II Health Committee of the Mental New York State 4-II Health Committee of the New York State A-II Health Committee of the New York St Committee in Syracusc Among the important things discussed were, first that the 4-H clubs might be used to aid student nurse recruitment, second, aid in fire-prevention week, third, promote bicycle safety, and fourth, be instructed in tructor maintenance, including safety Matters discussed at the meeting dealt chiefly with increas-About the same num ing farm and home safety ber of clubs entered the health contest this year as m 1946 The number of clubs entering this is still far less than one-half of the clubs in the

"The great need of having a health educator attached to the 4-H health office was again stressed and a formal request was forwarded to the proper authorities It is my own personal opinion that the health program will lag in this organization until such time when a full-time health educator will be available for this purpose"

Postgraduate Education —In addition to the in struction mentioned in the report of the Committee on September 30, 1947, instruction will be given in the near future in Dutchess, Madison, Monroe, Nassau, St I awrence and Steuben counties

Arrangements are being completed for a Regional Industrial Health Teaching Day in Troy on Thursday, December 11, 1947 Announcements will be mailed to the members of the following county medical societies. Alban, Columbia, Rensselaer, Saratoga and Washington

Instruction has been completed in Oncida Schoharie Seneca, Suffolk, and Wayne counties

Cancer—Dr Anderton presented the following report for Dr Mitchell chairman

A meeting of the Subcommittee on Cancer of the State Society Committee on Public Health and Education was held at the Roosevelt Hotel on October 17 1947 The meeting was called by Dr Mitchell Also present were Drs Adair Adie, Bacht Fitzgerald Jacobsen Lovin Perkins, Ran dall Sine By invitation the following attended Drs. Anderton Hannon, Redway, and Wetherell

Cancer Teaching in Medical Schools 'A discussion was held, headed by Dr Adair, relative to teaching about cancer to medical students. A plan favored by Dr Adair was presented in detail. It was the opinion of the Committee that a method of teaching which correlates the entire field of cancer should be adopted by medical schools in New York State. However before making a definite recommendation the Committee felt that an accurate knowledge of present cancer teaching throughout the State should be made available to it and that care should be exercised not to divorce cancer diagnosis entirely from other allied conditions. The committee strongly felt that cancer teaching should be as thorough and as practical as possible at the student level, and not be deferred until the period of postgraduate study "The Committee felt that it was within the

province of the State Society to encourage such a plan The Committee scales the advice of the Council regarding further pursuit of this matter

During the past 15 years there have been established, in various parts of the State, tumor clinics which have become a real asset to the community These are now accepted by the public and the profession They have become an im portant part of the cancer diagnosis and treat-ment program Inasmuch as these clinics offer a definite contribution, the Committee believes that the tumor clinic attention in the State should be reviewed the purpose being to survey existing clinics as to equipment and personnel. It is possible that additional equipment may be needed and that clinic physicians might desire further training by means of short term courses. At the present time detection centers and research have crowded into the background the one tangible cancer agency which we have to offer the public many ly tumor clinics. The survey should be carried out also to determine where additional tumor clinics might be established. There are too few existing at present, and with careful con-sideration of geographic, as well as population distribution the people of the State may be better served

The funds for this survey might be appropriated by the New York State Division of the American Cancer Society and perhaps it could be conducted under this agency

The Committee is impressed that this is an important matter and would ask the Council to look with favor upon it In the event it is approved your committee would gladly work out the details of its execution

Delection Centers

The Committee discussed at great length the subject of detection centers. It was felt that propagands of one kind or another had ad vanced this reasonably new form of examination to such a point that the public had become conscious of its necessity Realising that all efforts in the past to encourage periodic health examinations had not been entirely successful your committee suggests that a detection center type of examina tion with a definite goal in view for the patient, might stimulate people to greater effort patients seen in detection centers 1 to 2 per cent are found to have pro-cancerous or cancerous lesions while over 30 per cent of patients with other conditions needing treatment are found The by product of the cancer examination is important

"Your committee is of the opinion that detection centers should be encouraged throughout the State To obviate certain unfavorable features of these centers, as now established the Committee

has the following comments to make

Criticism has been leveled at the long waiting lists of established clinics, in some instances appointments being made twelve months in ad-vance. This was felt to defeat the purpose of the examination To overcome this defect it is recom mended that no waiting list be established beyond a reasonable period for the functioning of the center perhaps 4 to 6 weeks Each applicant after that period should then be sent by the center to his own physician or to one of a group of physicians who signify a willingness to conduct this type of examination

In order to have the examinations uniform and complete the physician shall be furnished with a form exactly the same as used by the center When he has finished this examination and completed the form returning a copy to the center he shall be paid a fee set by the center

By such a plan patients will be taken care of promptly and in greater numbers and physicians in the community will participate in the program

A statement on cancer detection centers has been drawn up by your committee, a copy of which is attached hereto

Dr Anderton then interrupted the report to read the statement, as follows

Statement on Cancer Detection Centers

"The organised medical profession has played a leading part in stimulating and guiding the greatly increased interest and activity in cancer control which has occurred within rocent years The confidence thus placed in the profession by the public carries with it a corresponding responsi bility to support any procedure in cancer control which offers even a modest chance of success Cancer detection or case findings by the thorough periodic examination of apparently healthy per sons is such a procedure—Your Cancer Com mittee has studied the principles and methods of cancer detection as developed in various centure now in operation. After thorough consideration of the various implications of this type of examina-tion the Committee endorses the principle of cancer detection or case finding as carried out in cancer detection centers and recommends active support of such centers by the medical profession It should be emphasized that comparable exami-nations may be performed by physicians in their own offices provided arrangements are made to

secure laboratory and x-ray examinations which should be included or which may be indicated Since experience indicates that the presence of organized detection centers stimulates the demand for periodic health examinations by private physicians in their own offices, it is important that physicians review their concepts as to the content of such examinations and make the necessary arrangements to furnish their private patients as complete and thorough an examination as is desırable

"Because there is considerable misapprehension regarding the nature and functions of detection centers, it seems desirable to review the subject

here

"Definition A cancer detection center is an organized medical group for the purpose of providing thorough examinations to apparently healthy adults Although the detection of Although the detection of asymptomatic cancer or of conditions (so-called pre-cancerous) which denote increased risk of developing cancer is the primary purpose of the examination, obviously many other unsuspected health defects may be uncovered by such examinations

"The center does not prescribe or perform any

treatment

"Relation to private practice Persons examined at the center are required to name a private practitioner to whom significant positive findings are to be reported and with whom any indicated therapy is to be discussed by the patient. This does not preclude a general report to the patient by a

physician at the center
"All interested physicians in the community should be privileged to visit the center and, if possible, to participate in its operation on a

rotating schedule

"Personnel of Center The following is a sug-

gested type of organization for the center "Medical internist, gynecologist, general surgeon, otolaryngologist, nurses (3), techniciantechnician-laboratory, secretary, and v-ray. social worker

"One physician should be designated as center chief, either on a permanent or rotating basis

"Other specialists should be on call for special problems which may arise In many centers the functions of the gynecologist may be taken over

by the general surgeon

"A radiologist should be a permanent member of the staff if the examination offered includes fluoroscopic examination of the esophagus and stomach and other x-ray studies of the gastrointestinal tract If the x-ray examination offered is confined to a chest x-ray, an x-ray technician will be needed to take the plates, which may be read outside the regular hours of the center's

"Scope of Examinations The scope of examination offered varies greatly Each center must determine how extensive an examination it can best perform The following procedures may be con-

sidered essential

A thorough history

Physical examination, including examination of the breasts, pelvic examination and rectal examination

Chest 1-ray

"4 Urmalysis, including examination for sugar

Blood serologic test

Vaginal smear examination in women, if this service is available

"Additional procedures, such as fluoroscopic examination of the esophagus and stomach, sigmoidoscopic examination, x-ray examination of the colon should be added if possible, in the order given

"Expected Results of Cancer Detection examination of apparently well persons may be expected to disclose the following types of con ditions (a) pre-cancerous conditions, (b) asymptomatic cancer, (c) other health defects number of such conditions discovered will depend on many factors, including (a) the extent of the examination, (b) the age and sex of the person examined, (c) the extent to which persons having definite clinical symptoms are admitted to the The experience of detection centers indi cates that approximately 4 cancer cases per 1,000 persons examined are discovered The American College of Surgeons has estimated that precancerous conditions are found in 1 5 per cent and other conditions in 30 per cent of those examined It is of interest that a recent survey in Oxford, Mass, revealed unsuspected diabetes in 2 per cent of all persons aged thirty-five years and over

"Importance of Avoiding a False Sense of Security Unless specifically warned, persons who are examined and found not to have detectable cancer may interpret this as meaning they cannot develop the disease for a considerable period after It is important that the lay the examination person be instructed that no such assurance can be given Otherwise symptoms which may develop in the interval before the next examination will be neglected, thereby defeating the very purpose of the examination, which is early diagnosis

"Need for Periodic Re-Examination In order to be effective in helping control cancer, the examination should be repeated every six months if possible The success of detection centers in having their 'patients' return periodically remains problematic It is highly probable that an im portant function of the practicing physician will

be to furnish such re-examinations

"Delay in Obtaining Examination Because of the considerable demand for this type of examina tion, most centers in operation must postpone It should be appointment for several months stressed that in some cases the person asking for an examination already has symptoms all persons who are given an appointment should be warned that if they have any symptoms they should not wait to be examined at the center but should at once consult their own physician Persons with clinical symptoms should not be admitted to the center "

Continuing with the Subcommittee's report "Your committee recommends that the Council encourage the formation of detection centers in the State of New York and that the Cancer Com mittee of each county society be advised of this action. Further, if the Council approves this recommendation, that a suitable editorial be published in the NEW YORK STATE JOURNAL OF MEDICINE, along with the statement of cancer detection centers

"Short Term Courses "The committee discussed the matter of short term courses as outlined by Dr Levin In brief, any physician associated with a tumor clinic or detection center may avail himself of the opportunity to study, for a period of 8-12 weeks, any subject which will help to perfect him in cancer work—ie, pathology, roentgenology, radiation therapy, cellular pathology

Tunds are available by federal grant for this purpose, in sufficient amount to reimburse the physician for tuition and living expenses for the

duration of the course

"It was the feeling of the committee that this project should be encouraged and made known to all physicians in the State having a direct interest in cancer Each county society should be in formed of the plan and any applicant should be recommended through his county society Applications to be made through the committee or

It was roted that the above recommendations be approved and sent to the County Medical So-

rietles.

BCG Advisory Committee -A meeting of the Council Committee on Public Health and Education and the BCG Advisory Committee was held on October 21 1947 Also in attendance were several officers of the Medical Society of the State of New York and representatives of the New York State Department of Health The BCG vaccination program consisting of two parts (1) administrative aspects, (2) technical guide for physicians was presented to the Council for its approval

After discussion at was roted to approve the report

as presented

Public Relations.-Dr Floyd S Winslow chair

man submitted the following report

The New 1 orl. Herald Tribune a magazine section. This Week ' for October 26, contained a splendid discussion of animal experimentation under the title 'Vivisection Lifesaver or Fraud? Much of the material for this article was gleaned from the pamphlet 'Dogs, Drugs and Doctors, prepared by the Public Relations Bureau and supplied to the author of this article

The Lehigh County Medical Society, Allentown, Pennsylvania, has ordered and paid for 1 000 copies of 'Check and Double Check. Approximately

6 000 of these pamphlets remain in stock.

Mr Walsh attended the Sixth District Branch meeting at Norwich, October 15 and the Third District Branch meeting, October 16 at Liberty He and Mr Anderson attended the Fourth Second, and First District Branch meetings at Amsterdam, October 23 Garden City October 29 and Kings-bridge Hospital Bronx, October 30

Mr Anderson and Mr Walsh attended the

Secretaries' meeting at Albany, November 5 Mr Anderson and Mr Walsh attended the annual meeting of Secretaries and Editors at Chicago November

6 and 7

Publication.—Dr George W Kosmak reported that he and Dr Laurance D Redway had attended the Conference of State Medical Association Editors held in Chicago In addition Dr Anderton Mr Auderson, and Mr Walsh were present.

The Publication Committee held its regular meet ug November 12 An editorial based on an ad dition to the Principles of Professional Conduct as toted by the House of Delegates at the 1947 meet ing regarding advertising was discussed matter relates to holding authors responsible more or less for any advertising or other publicity in con nection with publications, articles, or books written for the laity

It was roted that the editorial be withheld and that the Council be requested to submit to the House of Dalegates the question of the advisability of continuing this part of the Principles of Professional Conduct.

The advertising policies of the Journal were dis-

CHARALL

Rural Medical Service - Dr Mellen chairman reported that the committee has answered a questionnaire from Dr Crocker chairman of the Rural Medicine Committee of the A.M.A

with Veterans Administration.-Dr Bauckus chairman, reported that a meeting had been held in Chicago on November 6, under the auspices of the Council on Medical Service of the A.M.A. and the special Veterans Committee appointed by the Trustees of which he was chairman There were about 100 people present, representing 35 states General Hawley spoke for about an hour and was questioned about an hour He made a good presentation and also a good defense, but stated that there were many things beyond his control in the Veterans Administration program. The budget for 1948 of the Veterans Administration is seven billion It is estimated that there are 18,000 000 veterans entitled to or receiving some type of recognition, and that there will be 20,000 000 veterans finally The idea expressed was that the program for those needing medical care will have to be augmented in 1948 and 1949 and reach its height That is one answer to our statement about 1950 that we should discontinue the enlarging of our present facilities Under the present policy only sorvice-connected conditions are cutrified to this 'free choice of physician care

Dr. Hawley stated that Veterans Administration is forced to maintain outpatient clinics to take care of the existing case load, and also because the clinic facilities existed, they were supposed to make use of them but he knew that they did not have sufficient personnel, and would not have it for some years to take care of all of these cases He said there was no intention to expand the facilities, but there was a great deal of work to be done and that the load is expanding He said that probably from July 1946, to July 1947, 780 000 voterans were treated and he thought that in 1949 more than 2 000 000 voterans would receive treatment. Then he said maybe we should treat them all by the private physician plan but there is one fly in the ointment and that is it costs three times as much to do it that way than to do it by the regular facilities of the Veterans Administration Many challenged that and we were promised a breakdown of the figures Of course among the considerations of that was the fact that the veterans anyway go to their private physicians Many of them would not go to the regular facility of the Veterans Administration therefore the load there would be lessened in that

We agreed to meet with the Veterans Administra tion in Washington after our Committee has di gested some of this work

In New York State Dr Butler has recently been appointed Director and Dr. Bauckus is to meet him and take up several problems

Woman's Auxiliary - Dr Beekman chairman re-

ported as follows

The Woman's Auraliary to the Medical Society of the State of New York has been most active in its endeavors to assist the doctors in combating their opponents in the fields of socialized medicine in public relations, and legislation

On September 0 a meeting of the Advisory Council of the Society and the officers, directors, councilors, and chairmen of the standing committees of the Woman's Auxiliary was held at the Hotel Barelay in New York. The president of the Woman's Auxiliary, Mrs. Harry F. Pohlmann, presided. Dr. Dickson and your chairman attended. After the introduction of the council members, your chairman

acknowledged the debt of gratitude the Society owes The president then asked the comthe Auxiliary mittee chairman for suggestions and recommendations as to what should comprise the principle

activities of the fall program of the Auxiliary
The president, Mrs Pollmann, also attended a
majority of the District Branch meetings and gave a very adequate report on the activities of the Auxiliary in a talk before the members of the Second District Branch On October 22 your chairman met with Mrs Pohlmann and received a verbal report of the Auxiliary's activities and learned that these activities have taken her on many journeys throughout the State and even as far as Pennsyl-

On October 7 and 8 the Executive Board of the Auxiliary held its fall meeting at Port Jervis meeting was attended by 20 auxiliary presidents, 30 presidents-elect and 30 officers and chairmen of standing committees The principal speaker at the dinner session was Mr Lee B Mailler, president of the New York State Hospital Association and majority leader in the New York State Assembly At the morning session our field representative, Mr Walsh, spoke on the part each member of the Auxiliary could play in promoting doctor participation in the voluntary medical care plans

The president-elect of the State Auxiliary, Mrs Edgar M Neptune, has also been busy visiting the various counties and is using all her energies to organize auxiliaries in nonparticipating counties and to increase the membership in existing county

auxiliaries

Over 3,000 copies of the first issue of the Auxiliary's publication, the Distaff, were distributed in July through the efforts of Mrs Lec R Sauborn, the editor That this publication was well-received is amply proved by the testimonials of such people as Mrs Luthur H Kice, president-clect of the Woman's Auxiliary to the American Medical Association

Reports have already been received indicating that 28 counties have conducted 33 meetings various county officers and chairmen have made special efforts to interest the different counties in

their individual projects

The untimely death of Dr Alfred L Madden, the husband of our Auxiliary's past-president, has shed a mist of sadness over the members of the Auxiliary and your chairman takes this occasion to express the Council's sympathy in these moments of bereavement to one of the Auxiliary's most zealous members

Your committee is of the opinion that the Auxiliary has proved itself a most helpful adjunct in the field of public relations, and provided that we can furnish it with the guidance it so ardently seeks, the Auxiliary will be most helpful to us in our efforts to improve the quality and quantity of medical care and in helping the public to understand our views on socialized medicine, voluntary medical care plans and legislation in so far as it affects the health of our people

Workmen's Compensation —Dr J Stanley Ken-

ney, chairman, presented the following report
Radiology On October 7, 1947, the special
examining committee on Radiology examined five candidates

Meetings On October 25 your director attended a meeting of the special committee of the Connecticut State Medical Society to consider a revision of the Workmen's Compensation Law of the State of Connecticut, and on November 5 he attended a meeting of the Secretaries held in Albany

Medical Practice Committee It has been called to our attention by a member of the Council that the

Eric County Medical Society, over which the Medical Practice Committee has no jurisdiction, continues to receive communications signed by that Committee in reference to Workmen's Compensation matters The Eric County Medical Society has on a number of occasions complained about the alleged attempts on the part of the Medical Practice Committee to assume jurisdiction outside of counties having a population of one million or more The matter is again brought to the attention of the Council

It has been reported by four of the County Societies in New York City that, although the Medical Practice Committee is requesting the societies to pass upon the qualification of physicians in the first instance based upon their applications for original or re-rating, the Medical Practice Committee is not following their recommendations in many in

State Employed Physicians We have reported to the Council on one or more occasions that the Work men's Compensation Board has refused to authorize ecrtain physicians recommended by county medical societies for authorization, who are in the employ of the State of New York We are in receipt of a letter from Dr Gerald E Murphy, Mt Morris, New York, chairman of the Compensation Committee of the Medical Society of the County of Livingston, to the effect that a physican at Peterson Hospital, Sonyea attends many compensation cases arising out of con struction work on the hospital grounds, and this physician has been refused authorization by the The County Workmen's Compensation Board Society Committee is in favor of granting a rating It is the opinion of Dr Murphy that certain com pensation cases cannot be cared for properly unless this physician has a rating under the Workmen's Compensation Law A rating to this physician was refused over a year ago. We have been requested by Dr Murphy to refer this matter again to the Workmen's Compensation Board This is a matter of great importance and steps should be taken to obtain the cooperation of the chairman of the Work men's Compensation Board in this matter, so that proper medical care may be given to claimants in certain rural sections of the State

Legislation for introduction at the Legislation1948 Session of the Legislature has been prepared and

submitted to the Legislative Committee
The Chairman of the Workmen's Compensation
Board has requested the New York State Journal OF MEDICINE to publish a paper read by her before the Saranac Symposium on October 3, 1947, on "Viewpoints of Workmen's Compensation Adminis tration as to Occupational Diseases" Owing to the lack of space, it was impossible to publish the paper in full, but an abstract was made at the request of the editor and was published in the December 1 issue

### New Business

Dr Anderton reported that the American Medical Association will hold its Eighth Annual Congress on Industrial Health in Cleveland, Ohio, on January and 6, 1948, and has requested that this Society send a representative or representatives Dr Mitchell, under whose Committee on Public Health and Edu ention there is a Subcommittee on Industrial Health has taken the liberty to suggest that the expenses of going to that meeting be defrayed for Dr Leon Griggs, of Syracuse, who is the Chairman of his Subcommittee on Industrial Health

It was voted that the Council recommend to the Board of Trustics that Dr Griggs expenses

be paid

### NECROLOGY

Lynn Staley Beals M.D of Buffalo, died on October 2 at the age of seventy After being gradu aled in 1901 from the Harvard Medical School, Dr Beals interned at the Massachusetts General Hospital in Boston. He was attending physician at lafayette General and the Salvation Army hospitals in Buffalo and assistant professor of medicine at the University of Buffalo School of Medicine prior to his retirement nine years ago. ### NAIL REMOVED FROM SMALL INTESTINE BY MAGNET FOR FIRST TIME

For the first time a foreign body has been removed from the duodenum (the part of the small intestine leading from the stomach) by a magnet, according to an article in the October 18 issue of The Journal of the American Medical Association

Up to this time a serious surgical operation has always been necessary, say the writers, Murdock Equen, M D, Robert Gilliam, M D, and Merrill Lineback, M D, all associated with the Ponce de Leon Ear, Nose and Throat Infirmary of Atlanta,

Georgia

The case involved a four-year-old boy who had swallowed a nail, which reached the second portion of his duodenum, point up, two days later. An operation was planned. Then someone suggested that perhaps the nail could be removed by means of the magnet which has so greatly simplified the removal of safety pins from the windpipe and the

removal of any magnetic foreign body from the stomach. The boy was brought to the Ponce de

Leon Infirmary

With the help of a "chocolate malted" the child finally succeeded in swallowing a new model of the magnet, slightly curved so that it could get around curves more easily, and with a groove around one end holding a loop of strong waxed thread Several hours later he exclaimed that he had "felt something click," and complained of a dull pain showed the magnet in contact with the nail

The boy was then given other, and under v-ray guidance the magnet and nail were slowly pulled back into the stomach by the string All three The procedure could then be rapidly withdrawn took less than two minutes, the doctors report, and by the next day the boy was none the worse for his

experience
